OUR ILLUSTRATIONS.

The New St. Paul's Bridge:
 First Premiated Design. General Drawing, giving Plans and Elevations; also view of one of the Bridge Piers. Mr. George Washington Browne, R.S.A., Architect.

Second Premiated Design. General Drawing, giving Elevations and Details. Mr. Charles E. Barry, A.R.I.B.A., Architect.

Apley Grange, Harrogate, Yorkshire. Mr. T. Elwin Cooper, F.R.I.B.A., Architect.

House, St. George's Hill, Surrey. Messrs. S. E. Castle and G. Warren, Architects.

A VERY GENERAL FORM OF SPECIFICATION.

The perusal of what may be called an elastic building contract brought to our recollection the old conundrum, "When is a door not a door?" But we had to parody it, substituting "architect" for "door," and then we learned when an architect is not one. The "man in the street," of course, fancies an architect requires no qualification of any kind except that vulgarly known as "cheek"—Charter is coming presently, some think, and will be worth about as much—and that anyone may design and superintend the erection of a building just shot out of a "technical school," even though he may never have seen a brick or stone laid, or a piece of carpentry framed, in his life.

Architecture concerns itself with design and construction. The former embraces a knowledge of the Styles or Orders, and the latter that acquaintance with building materials which enables the architect to select the best for his purpose, and to dispose of them to the best advantage. Very little consideration will show that it requires no experience to set up a building in any style on paper; but it is altogether another thing to deal with building materials. That requires not one year's, but several years', close study of the practical application of these materials after the student has received a sound scientific education. Just at present architects all over the world are devoting their energies to the foundation of schools for teaching the pleasant shuffling of architectural forms, while the more important question of the nature of the materials to be used in giving permanency to these forms is practically ignored. Some architects start in life—thanks to trustful friends or relations—with the erection of important public buildings, who frankly admit, privately, that they know nothing about building materials, and very little about construction. They gradually acquire this information at their clients' expense, when they should have picked it up during an apprenticeship in some builders' workshops.

But to return to our specification. We find that wherever the word "architect" is used in the document before us, it may mean any engineer, surveyor, or other official, no matter by what name he is called, so long as he is entrusted by a public body with the laying out of building work and superintending its execution. In this case the "authority" is a district council. This definition of an architect and of his duties should be liberal enough

to satisfy the most daring poacher in architectural preserves, and one is not surprised to find in some country districts that the difference between an architect and a road-mender is not clear. This description of an architect is by an officer of a public board, and it is strange what little respect public bodies have for the profession! Not many years ago we saw at Whitehall an invitation to men to join the Royal Engineers as recruits, "architects, saddle- and harness-makers," being preferred—one of the inducements being a free kit!

We will now proceed to examine the general conditions of this specification; and very strange ones they are. The contractor is required, after at least seven days' written notice, to be at the site on a certain day to take instructions as to working to lines and levels, all of which will be laid out by the architect. And now comes the strangest thing of all. The contractor must satisfy himself that the architect has done his work properly, as he will be held responsible for it, and he must rectify, at his own expense, any errors in dimensions, lines, or levels in carrying out the works! The contractor has apparently two guides to his work—his contract drawings and the lines and levels presumably staked out by the architect. But he has the consolation of knowing that in following either of these, or both, if there is any mistake, he will suffer. We should say to the architect, "Hand the contractor your drawings, and let him lay the work out for himself; but if you do it for him, be man enough to stick to your guns and bear the loss, if any, consequent on your mistake." The laying out of any ordinary building is no great matter, and the work almost checks itself, so that only sheer carelessness can lead to disaster. The longest lines may be traced out absolutely straight with cords and pegs, and the right-angles checked by the 47th proposition of Euclid's first book, taking the triangles with as long sides as possible. For instance, no one would take 3ft., 4ft., and 5ft. if they could get 30ft., 40ft., and 50ft. Right-angles may in the first instance be laid down with squares in the usual way, this being the nailing of three selected flooring-boards together; but the angles should always be checked by calculation as suggested above. Level-lines are usually fixed by means of a straightedge on which a spirit-level about 12in. long is balanced. But readings taken in this way do not always agree, especially when the spirit-level has fallen off a scaffold some half a dozen times; so that where possible an

engineer's level should be used for this purpose. A long level-line can only be run with a bricklayer's level by taking several readings on a straightedge adjusted by pegs driven in the soil; and he would be a clever workman who, after shifting his straightedge half a dozen times, could guarantee the accuracy of his work. We have seen hours wasted with this kind of levelling, when a dumpy level would have done the work accurately in quarter the time.

When the work is started, it must be pressed on, for time is the essence of the contract; and if long-continued frost delays the work, the contractor must inform the architect of it, though one would think the architect would know whether it was freezing or not without being told. It has been suggested that brick- or stone-work may be carried up in frosty weather by using hot slaked lime in the mortar; but it should not be forgotten that hot lime means imperfectly slaked lime, and that as the slaking proceeds the lime swells. Its use may be dangerous under certain conditions. "It is to be distinctly understood" that the work shall be good and sound, and that all horizontal and vertical lines and plane surfaces shall be worked quite true; for it almost implies that other clauses were meant not to be distinctly understood—which shows that it is possible to say too much in a specification as well as too little. A clause here provides that the architect shall have power to open up the work for inspection—of course, at the contractor's expense; but this is unreasonable, for if he cannot visit the work often enough, he should employ a clerk of the works, who could certify as to the nature of the work done in his absence. Again, the architect may demand to see vouchers that the materials and work are as specified; but this is unfair—the architect should be able to judge of the work without such assistance. Vouchers are valueless if they deal with materials only, for these are "first" or best quality, as known to the trade, though they may fall far short of the architect's specification. For example, an architect may specify that certain floors are to be free from sappy wood, and he may find that what he considers sappy the trade will consider as reasonably free from sap; and if he specifies "first quality," or "best," he may find that these words mean something else than what they mean in plain English.

As in other specifications which we have reviewed, so in this, there are to be no extras, and the contractor will have to find everything that may be inferred as

necessary, though not described in the specification or shown on the drawings; and the reason for this is that the contract was for a completely finished building fully adapted to its purpose. It will be seen all through this specification that the architect makes the most elaborate preparations for ridding himself of responsibility for his own shortcomings, and saddling them on the contractor. We have always thought that, if it were possible, part of an architect's training should be taking building contracts under strangers, for in this way only can he be made to feel what the injustices are which builders suffer when they have to carry out works under an architect who enforces unreasonable conditions.

In large cities, of course, builders form a kind of trade-union, and in such cases they are strong enough to insist that the conditions of contract, apart from those of a purely technical kind, shall be equitable. Architects, too, have standard conditions; but as these are generally drawn up in consultation with the builders, there is little friction in carrying out the work. Reasonable people would scarcely imagine the absurdities that some men attempt to enforce under conditions of contract; and the strange thing is this—the responsibility meant to be enforced has no corresponding sum for insurance in the quantities. Several years ago a contract was taken for restoring a church in the Midlands. This church had a tower which was evidently built in two stages at different periods. The lower stage was rubble, with dressings to the door and windows which gave no clue to its date, and the upper stage was wholly of cut stone of 15th-century style. Now, the rubble portion of the tower was pebble-dashed, and through the dashing it could be seen that the walls were fractured from top to bottom. There were two corner buttresses, and these were forced out so far from the wall that an arm could be thrust between them in places, and it was obvious to any practical man that the upper stage was bursting the lower stage asunder. Now, strangely enough, the architect provided for taking down the upper stage and rebuilding it on the bottom one. The builder pointed out that this would be most unwise, for it was the lower stage which was at fault, and if steps were not taken the whole would come to the ground. The architect, however, insisted that the lower stage was quite safe; but the restoration committee thought differently, and they issued an appeal for funds to rebuild the whole tower, which, they said, was in a dangerous condition. During the progress of some works at the west end of the nave the tower was much shaken, and it settled down in a heap of stone and lime rubbish. Although the builder pointed out several times the dangerous condition of the tower, the architect at once disclaimed any responsibility in the matter, and he pointed out a clause in the specification which bound the contractor to make good any failure in the building during the execution of the work. Now there was nothing in the quantities about providing for such a contingency; but the contractor was asked, under threat of law proceedings, to rebuild the tower at his sole cost, and this he refused to do. In the end the restoration committee rebuilt the tower themselves, employing another contractor. But there was perpetual enmity between the architect, the committee, and the man who should not have had any blame attached to him—the contractor.

In many specifications there are money provisions—usually defined by the letters "P.C." (prime cost)—and here we find that

prime cost means actual cost after deduction of all trade discounts, but not bonafide cash discounts. In many contracts there are large sums held over at the architect's disposal, and we think it a pity that this should be so, for we have known the privilege to be much abused. Where sums are fixed to be included in the contract for grates, chimneypieces, locks, etc., it would always be better to inform the employer of that fact, and get him, under the architect's guidance, to select and pay for these things himself. We have found that nothing short of complete abstention from handling money in this secondhand way will protect the architect from a suspicion of taking illicit commissions. Another clause, again, protects the architect, for he provides that where the drawings and specification do not agree he shall have power to order the contractor to carry out the work as he may direct. The contractor shall be responsible for all injuries caused to the work by lightning, frost, or other inclemency of weather, or by fire, and shall make good and reinstate all work so damaged. We never could understand why the building-owner does not insure the building himself against all such risks, for surely it is a roundabout way to get the builder to do it, when the expense falls on the owner in the end. It appears to be absurd when the contract goes so far as to require the builder to insure the buildings against loss by fire for the full amount of his contract for a period of twelve months, and hand the policy over to the building-owner before any payment is made to him on account of the works. The architect makes rather a wise provision in enabling himself to certify for payment for work, even though it is not in accordance with the contract, deducting from the contract the difference in value between the work done and that provided for. We have often been in a fix to know what to do in such cases, for the contractor will sometimes, either intentionally or through default, lower the class of work provided in the specification, and it may not be advisable to pull all such work down. The remedy is, however, provided when the architect makes it a condition of contract that he can certify for inferior work, making a suitable deduction from the contract. Without such a clause he dare not do it.

PROFESSIONAL ALLIED SOCIETIES AND THE R.I.B.A.

The special meeting held on Monday last at Conduit-street was very fully attended. The greater part of the evening was devoted to the question raised by Mr. Sydney Perks's amendment in regard to the proportionate representation of the allied societies on the Council, which he wished to restrict, in order to preclude these architectural provincial bodies from being given a larger representation on the Council than the Associate members of the Institute.

Never before have so many presidents of the allied societies been present at a meeting of the kind convened by the R.I.B.A., and there can be no doubt as to the unanimity of all the speakers in urging the necessity of a more adequate representation on the Council of local architectural centres affiliated with the Institute in the United Kingdom.

Before the proceedings commenced, the President-elect, Mr. Ernest Newton, A.R.A., proposed a vote of thanks to Mr. Reginald Blomfield, R.A., the outgoing President, for his services during his term of office. Sir Aston Webb, R.A., seconded the motion, which was enthusiastically received, and the President, who was in the chair, suitably replied briefly.

Mr. William Woodward opened the debate by opposing the adoption of Mr. Perks's amendment introduced at the previous meet-

ing held on June 8, and given by us on p. 877 of our last issue. Mr. Woodward urged the importance of recognising the necessity of bringing the local practitioner more into touch with headquarters, so as to enable the metropolitan members to appreciate and more fully enter into the difficulties of architectural practice and methods in the country. The allied societies, numbering in all 28, included 19 located in the British Isles, each of which has an accredited centre of a district and an agent of that district in relation with the heart of the system in London. At present six of these societies only sent a representative to the Council, and the Associates were similarly represented.

Speaking on behalf of the Liverpool Architectural Society, Mr. G. Hastwell Grayson, M.A., thought that the 1,942 members of allied societies had not at present a sufficient representation on the Council. They did an enormous amount of "police work" for the central body, and contributed very largely to the success of the Institute, with which the north-country men were only too glad to be associated; but they realised how little they often were understood, and without more close relationship little progress would be possible, and therefore he came specially to the meeting to vote against Mr. Perks's amendment.

Mr. Albert Edward Murray, R.H.A., representing the Royal Institute of Architects in Ireland, strongly pressed the fuller representation of these country bodies at headquarters, and said that although the Irish institute was only two years younger than the R.I.B.A., there was no doubt whatever beyond St. George's Channel as to the importance of the urgent question of more intimate alliance with Conduit-street in the general interest not only of the profession, but of the public as well. He did not sympathise with the dread entertained by those who wished to prevent the augmentation of this representation, and their fear reminded him of the old lady who, when the wind began to blow, went up to the captain to inquire if there need be any fear, and was there any danger. "Madam," said he, "there is plenty of fear, but precious little danger."

An Associate contended that Associate members of allied societies should be sent up if need be to occupy a seat on the Council, and he would be glad to see outsiders even who were members of such a society if elected for the purpose being welcomed on the Institute Council, so strongly did he consider the need of association.

Mr. J. Alfred Gotch, F.S.A., President of the Northamptonshire Association, having served for 27 years as the Father of the Council, insisted on the high importance of this question, because too often he had found that London men knew nothing of the exigencies of provincial work, especially in the matter of quantities and in other methods of practice, which seemed impossible to metropolitans, but which really worked very smoothly in the country. He had always realised the need of more representation, and had urged it on all occasions, so that he was glad that the Council had now decided to increase the direct membership of representatives at the central chamber. There was not the slightest chance of such members ever being able to swamp the Council, and he spoke very warmly in condemnation of the amendment, as he wished to encourage sympathy between London architects and the enormous number of their brethren in the country districts.

Mr. Robert Burns Dick, of Newcastle-on-Tyne, said that two-thirds of the Northern architects whom he came South to represent were members of the Institute, but till a more adequate connection was brought about, the Institute would be dead to the bulk of the profession outside it, and he forcibly advocated the demands which were being made for better representation.

Mr. W. Curtis Green, immediate past President of the Architectural Association, deprecated professional politics and party conflict, saying that they stood for something of a higher order, and apart from selfishness (not even excepting the advancement of very

young architects), so that he should employ his endeavour to further the art of architecture rather than promote a sort of trade union.

The President of the Manchester Society of Architects remarked that the position of his association was assured, and so he could speak quite impartially. He condemned strenuously any such restrictions as Mr. Perks proposed. The payments made by the members of an allied society, like that in Manchester, amounted to a very considerable sum, and if they were precluded from representation, they got very little beyond the "Journal" and the questionable advantage of having assessors sent down from London to judge their local competitions, though he agreed that sometimes these contests were not strictly local, inasmuch as they were open to all comers.

The President of the Bristol Society of Architects spoke of the proportions of fellows, associates, and licentiates in his association and of its loyalty to the Institute, no member of the local body being willing to take pupils who did not agree to submit to the examinations held by the Board of Architectural Education. He contended that direct representation on the Council from the leading allied societies was a vital matter of growing importance.

Mr. F. A. Watson, President of the Sheffield Society, thought it was unfortunate that an allied society should not be represented when the president happened to be an associate, as had occurred for eight or ten years at one time in Sheffield, and some outside members of their body also were extremely capable men of valued experience. He was absolutely opposed to Mr. Perks's proposal, and he thought that the country members were far better represented by men who came from the country towns and knew intimately their peculiar practice in details.

Mr. Sydney Perks, in reply, urged that his amendment did not concern the larger question of Registration, but had relation to by-laws. His figures given on a previous occasion being questioned, he had employed a firm of chartered accountants to verify them. Chartered architects need not necessarily alone be elected as presidents of allied societies, and he pressed his contention that the associates, as time went on, would automatically become under-represented, as they decreased proportionately as compared with other extensions of the franchise. Mr. Perks's amendment being put to the vote, was lost, 84 voting in favour of Mr. Perks, and 163 against.

Mr. Topley then proposed a further amendment to secure that allied societies should not have larger representation than corporate members on the Council, and to refer this clause 10 back for further consideration, because those who had passed examinations ought to have as good representation as those who had not. Prudence, he urged, demanded care. This being seconded by an associate, was lost by an overwhelming majority. Clause 10 then being put to the meeting, was carried by a vote of 168 to 95.

Clause 8, allocating the proportion of the standing committee for registration as a board or court of the first instance, as explained by Mr. Stanley Peach, was agreed to, and so also was clause 9, limiting this committee to 23, ten being Fellows, 7 Associates, and 6 Registered Architects, of whom 3 should be Licentiates until such date as the class of Licentiates shall have expired.

Mr. H. Shepherd previously proposed an amendment to this last clause, Mr. Topley having failed to bring forward his amendment printed in the agenda paper, and instead he seconded Mr. Shepherd's proposal, which comprised a proportion of 8 Fellows, 4 Associates, 5 Licentiates, and 11 outsiders, this being said to give a better representation and cover all men who were qualified. When put to the vote, 72 supported this amendment, and 160 voted against it.

The remaining business included a resolution empowering the Council (which will be the new Council) to employ the Institute solicitors to prepare a draft of the whole scheme ready to be submitted informally to the Privy Council, it being understood that

any clauses dealing with the property of the Institute will be submitted to a general meeting for confirmation. The proceedings closed at a late hour.

Several past presidents and senior members were among those present, including Sir Ernest George, A.R.A., Sir Henry Tanner, C.B., Mr. T. E. Collett, and all the vice-presidents and Council attended, but perhaps not so many Associates as on the last occasion.

QUANTITY SURVEYING.*

By LESLIE H. ALLEN, 8, Beacon-street, Boston, Member Boston Society of Civil Engineers, Member American Society of Engineering Contractors, Member American Institute of Quantity Surveyors, Member British Concrete Institute.

We are living in days of progress. But there is one rut in which we seem to have stuck fast and have made no progress, and that is in our extraordinarily wasteful system of competitive estimating on building contracts. When it comes to building a factory, a house, a theatre, or a church, the contractor is invited not only to guess or calculate how much it will cost before it is built, but also to guess or calculate how much material goes into it; and this work is done not by one builder, but by eight or a dozen, and the labour of all but one is absolutely wasted. It is hard to impress either the architect or the building owner that this waste is unnecessary or can be eliminated. The building owner, if he is engaged in manufacturing, would say it is only selling expense, anyway, and selling expense has to be incurred. But the selling expense of a builder's office is a very different thing to a manufacturer's selling expense. The manufacturer's salesman has to draw the attention of the prospective purchaser to the merits of the goods he is offering, and bring himself before the purchaser's notice. But in the case of the contractor, when all this work has been done, a very heavy expense is incurred by the builder in figuring out how much to offer to sell his work to the building owner for. In the case of the salesman all this is done for him before he ever starts out upon the road, and if every salesman had to figure out the cost on the spot of the articles he was furnishing, and also the quantities of articles he would be required to furnish, his duties would be very much more arduous than they are. The cost of an automobile or a piano is known before it is offered for sale; but the contractor does not know the cost of his building until it is built. I wish I could impress upon the architects and owners present the time that is required to make an accurate schedule of the quantities. If a builder wants to take off a 100,000dol. job properly it requires at least a week of hard work, day and night. So much of the builder's work is unproductive that he does not put in as much time as he should, or would like to, on the estimate for any one building. Owing to the short time that he is allowed he has to take the quantities off very roughly. During the day material-men and sub-contractors are busy with his plans, and he has only the night. Many contractors have to be satisfied if their estimates of quantities are within five or even eight per cent. of accurate, and only take off roughly, with very little detail. Those contractors who wish to estimate accurately and closely have to spend a lot of time on their estimates. It is disheartening to figure week after week and get very little of the work on which so much time and thought has been placed.

This matter used not to be so serious in days gone by, when competition was not so keen and estimates were not made so closely. The estimates of many of the best contractors then were the roughest of guesses. They carried a considerable margin for contingencies. The old books on estimating tell the estimator to add from five to ten per cent. to the estimate, to cover contingencies and unforeseen items. In consequence, esti-

* Notes of an Address given before a joint meeting of the Michigan Chapter, American Institute of Architects, the Detroit Engineering Society, and the Builders' and Traders' Exchange, Detroit. Communicated by the Author.

matings was not a very serious affair, and contractors were very prosperous people. In the present day estimates have to be figured very closely, and to figure them closely they have to be figured accurately, and the time and expense of doing this is very great. Very many builders of the old times still with us, who estimate by rough approximation methods of estimating, are losing their hold on the business situation. In my own city the large builders whose names were names to conjure with fifteen or twenty years ago are bemoaning their lack of work to-day. It is all being gained by the younger men, who are figuring much more closely than they ever dreamed of figuring or knew how to figure. It is assumed by the architect and the building owner that when his plans and specifications are complete the quantities of labour and material required for the erection of a building can be accurately and correctly figured by the contractor's estimator, and so a lump-sum bid is asked for, and the plans are given to the contractors to figure. The fallacy of this assumption lies in the fact that it is not possible for a contractor's estimator, however expert he may be, to understand and read the plans of the architect or engineer, in the short time allowed, so clearly as to be able to scale every item accurately. It stands to reason that a contractor's estimator cannot in one week become as familiar with the plans as the architect or engineer who has spent some months in creating them.

When the plans and specifications are completed it is obvious that a certain quantity, unknown, of labour and material will be required to complete the building. No amount of careful figuring by any contractor can decrease or increase the amount of those quantities in any particular. They are fixed by the plans and specifications. If ten contractors are to figure, each one of these competes with the others in seeing how much or how little brickwork, concrete, plastering, and so on he can figure in his estimate, and yet feel that the job is safe. None of them get exactly the same quantities in their estimates. He first has to compete in accurately figuring quantities before ever he starts to put a price upon his quantities and start the price competition. No figuring will make one brick take the place of two, or will make one hundred barrels of cement mix a thousand yards of concrete. These quantities are fixed and unalterable, and it seems absurd that there should be this unnecessary competition in quantities, and before prices are put on estimates. In 1908 the Illinois Chapter of the American Institute of Architects prepared a report which deals with this subject. Their report states that they investigated the office work of five representative contractors. They found that the average number of contracts estimated by each builder in one year was seventy-two, and the average number of jobs which he obtained from these estimates was ten. The average value of the time spent by the office force of each firm on each estimate was 125dol. The average expense on each estimate, including additions by sub-contractors and material-men, was 378dol., making a total of 503dol. spent by each builder on each estimate. In addition to these expenses, the head of each contracting concern spent 21 per cent. of his total time in estimating or overseeing the work of estimating. I have not time to quote the whole of the report, which is reviewed in the "Engineering Record" of October 24, 1908; but it goes on to point out that the cost of six bids on a building costing between 100,000dol. and 150,000dol., ran to over 3,000dol.—that is, between 2 per cent. and 3 per cent. on the whole cost of the work, and it is further figured that in the City of Chicago the contractors spend in one year one and one-quarter million dollars in the preparation of estimates, of which only 210,000dol. is productive expense which results in getting estimates. The other one million dollars is entirely wasted.

Who pays for all this unproductive expense? It seems obvious that in the long run it is paid by that vague personality the ultimate consumer, who, sooner or later, has to foot the bill without knowing it. Directly or indirectly, all this burden is shifted by the

building trade or building-material trade to the shoulders of the building owner, and not only this burden, but the bad debts caused by contractors' failures, more than half of which are due to estimating on incorrect quantities. The sceptical will think I am presenting an overdrawn picture of the inaccuracies of builders' estimates and the losses consequent thereupon. Ask any credit man what the worst risks are for credit; builders and contractors will be among the number. The percentage of failures is very high, and a very large proportion of the failures is due, not to mismanagement, but to bad estimating, and of those due to mismanagement a lot of loss is due to time being spent on estimating that should have been put in on supervision of work in progress. It seems too bad that the building industry, handling as it does such a large proportion of the trade of the country (the whole of the output of the cement, burnt clay, and cut-stone trades, a large part of the output of the steel, glass, paint, lumber and slate trades) should be thus handicapped. Is there any way in which the existing state of affairs can be improved? I think there is, and it is for that reason that I am before you to-night, to discuss with you the quantity system of estimating. This has been much discussed of late, and it is probable that most of you are familiar with the general outline of what is understood by the term quantity surveying, or the quantity system of estimating. But in order that there may be no misconception on the part of any of my hearers, some of whom may have this put before them for the first time, it will be well to define what I understand by the quantity system of estimating. In brief, then, a bill of quantities is an accurate schedule of the quantities and description of the work (labour and material) required in the erection of a building, in accordance with drawings and specifications supplied by the architect or engineer. A quantity surveyor is an independent party appointed by the owner, architect, or engineer, whose duty it is to prepare the bill of quantities at the owner's expense.

Under the quantity system (as advocated by the American Institute of Quantity Surveyors) bills of quantities will be furnished free of expense, with the drawings and specifications, to all bidders desirous of bidding in competition. Lump sum bids will be based upon the quantities of work scheduled in the bill of quantities, the character of same being ascertained from the plans and specifications. In the event of any errors the cost is adjusted between the owner and the builder by the surveyor, so that the builder takes no liability for the accuracy of the quantities. This is a matter for the owner and the surveyor to settle between them, and this I shall discuss later. The quantity surveyor should be a man who makes it his sole business to take off quantities. He should receive the plans from the architect and compute from them the quantities of material and labour for the building, in the way that the contractor's estimator does now; but as he gives his whole time to the work he is able to work more carefully, and has more time to make a careful and detailed estimate. Also, if he is paid a proper fee for his work, he is able to have all his figures carefully checked. Contractors, as I have said, cannot give their whole time to estimating, and they have to work so quickly that there is no time for any but the most superficial checking of the quantities, except by the square foot or cube foot price of the building—a very unreliable method. The quantity surveyor should take off the whole job, and not confine himself to those trades which will be executed by the general contractor's own force. A bill of quantities should contain separate schedules for mason-work, structural steel, earth work, concrete, structural carpenter work, finished carpentry, hardware, plastering, plumbing, painting, ornamental iron-work, and so on, and the quantity surveyor should be a man of sufficient technical education and training to know enough about all these trades to be able to take off quantities for them in the way in which various contractors and subcontractors measure them, in order to price them correctly. It is the aim of the quantity surveyor to take off and describe the items

in just the way that will be of most service to the contractor, and to give such information in the schedules as will be clear to him. This is a very important matter, and on it largely depends the success of the quantity-surveying movement. We all know that similar work executed under different conditions on the same job will vary in cost. Brickwork in manholes will cost less to build than walls of office buildings; 8in. brick walls cost more per thousand than 12in. work. Concrete formwork is an item of expense that bears no relation to the yardage, and has to be measured separately. Every surveyor should work on the same method, measuring all work net, deducting openings in brick-work, carpenter work, and plastering, etc., measuring forms separately from concrete work, and in general giving items in detail.

If the quantity surveyor gives his whole time to this work it is much easier for him, by consultation with the architect, to straighten out difficulties and points not clear, than it is for the estimator, and he is able to discover and point out inaccuracies in the plans which do occur even in the plans of the most careful architects, and is able to suggest amendments to specifications where they are deficient in description or ambiguous in meaning. He is often able to start work before the plans and specifications are completed, and save some time that way. When he has finished taking off the items of his estimate are collected and sorted and brought into schedule form. A separate schedule or bill is made out for each trade; these are bound up together, and a copy is made for each bidder, and sent out to the general contractors who are invited to tender. The schedules contain sufficient description for the contractor to understand fully what the items are that he has to price, and he does not need to spend much time going over plans and specifications, as all the information he needs is in the quantities. When a contractor receives the schedule of quantities he prices all the items in the trades that he himself proposes to execute, or which he is competent to price, and the schedule of items which he intends to sublet he passes out to subcontractors to price on the same lines that he does. When the pricing is completed and extended the totals of the various schedules are collected, and profits and incidentals—insurance, etc.—added, and the bid is ready to be put in. There are, of course, advantages and disadvantages in the quantity system. One great advantage is that all contractors know what they are bidding on, and are bidding on the same basis. It frequently happens that with the greatest of care yet there are items which are not easily understood on the plans, and things that are indefinite or bear a double construction in the specifications. In such a case, half the contractors bidding will interpret this in the way that looks to them cheapest, the other half will interpret this in the way that looks to them the best, whether it is the cheapest or the more expensive of the two. If the man who has figured on the cheapest way of doing the work gets the job, and finds his guess is wrong, trouble arises at once. The quantity surveyor, having been in much closer touch with the architects than it is possible for half a dozen contractors' estimators to be, would notice and clear up these indefinite points before his quantities were finished, and as the contractors are competing on price only, and not on quantities, the owner feels more sure that he is giving his contract to the man who is able to do his work properly, at the lowest possible remunerative price. He is not giving his contract to the man who is most skilful at drawing off quantities. He does not care whether his contractor is skilful at quantity surveying or not, if he can build a good job for him, and yet under our present system the odds are all in favour of the man with the cleverest estimator getting the job, regardless of whether his building work is good or not. There is also less chance of work being given to an incompetent estimator, who has left out some important item in the estimate through inadvertence. There is no doubt that such a man, working even with the best motives, will strain every nerve to cut corners and save cost of the building, to the ultimate detriment of the fabric and annoyance of the owner.

It is often urged that quantity surveying will add to the number of worthless competitors; but I have also heard many claim for this system that it will eliminate the worthless competitor. I cannot promise that it will do either; but it will reduce the risk of work being let for less than cost to a man who has left some items out because he is not a good estimator. It has been objected that if the quantity system were established that no man would be able to exercise the right of judgment in making up his prices. This objection arises from a misunderstanding of the meaning of a bill of quantities. A bill of quantities would schedule, for instance, the number of fire-doors, with their description, that were required for a building, giving the number of swing-doors and the size of each and the number of sliding-doors and the size of each. But this schedule would not prevent the fire-door contractor from looking at the plans and noticing how many were on the first floor and how many in the pent-houses, and whether there were any difficult conditions in the plans that he would have to contend with. In the same way, the schedule of quantities for plastering work would describe in a different way plastering under different conditions. All ceiling plastering requiring ordinary staging, in two coats, would be classed together, but plastering for a high-studded room requiring a specially-built stage would be put down as a separate item. Plastering on flat wall surfaces, if all three-coat work, would be made in one item. Plastering on metal lath would be separated and put down separately, and plastering in narrow widths or on circular walls would also be measured as separate items. The bill of quantities should contain an intelligent description of each class of work and every variety or item of work in that class. If not, it would not be a proper bill of quantities.

It has been claimed that quantity surveying will reduce the cost of building work. This is doubtful, although logically it should in many cases. I think that it will reduce costs in three ways—first, it is certain that the very large overhead unproductive expense which I have spoken of will be saved; and, second, the men who before spent all, or a lot, of their time in figuring quantities, will be free to devote themselves to effecting economies in the conduct of building operations. Especially the contractor himself will be much freer to supervise his work if he does not have to spend so much time in supervising his estimating work, and this should result in economies in labour costs being effected on the job. Third, it will not be necessary to add a contingency item to the bids to cover possible errors in estimating and unforeseen contingencies. On the other hand, the very low bid put in by the inexperienced or careless contractor is likely to be eliminated. It is fairly certain that bids will be closer than at present, and I believe that the bids of the conservative contractor will be somewhat lower. Whether bids will be lowered or not they will certainly be "closer," and there will not be the same risk of very low figures being put in—figures containing errors that bring the estimated total to less than the actual cost of the work. Mr. G. A. Wright has well said that an architect or engineer who knowingly advises an owner to accept a bid which is lower than a job can be done for is evading a moral issue. In addition to this he is a fool if he thinks he can get something for nothing. No amount of inspection will make a cheap building good or compel a builder who is endeavouring to save money at the expense of the job to put in all that is called for. The owner gets what he pays for. Unfortunately, he often does not realise till too late that the cheap building he has bought is cheap in another sense, and inferior in workmanship and costly in maintenance. This is true of many cases; but many other cases arise where the architect does not know, and has no means of knowing, whether the bids are too low or not. Even if the quantity-surveying system did not lower bids, but raised them, I think it would lower the bids of the more careful contractors and raise the bids of the careless. The owner would have the satisfaction of knowing that he was paying a fair price for his building and that

he was likely to get a fair building for his price.

The subject seems to have been obscured by the suggestion that a reorganisation or a radical improvement in the methods of preparing plans and specifications in architects' offices is a necessary preliminary step to the establishment of a quantity-surveying system. This is not the case. The quantity surveyor's duty is to take plans and specifications as he finds them, and from them compute the quantities of labour and material in the building. It is, of course, desirable that the plans and specifications should be good ones, and the better the plans the better his survey; but even with a poor set of plans he is likely (because of his greater experience and the facilities at his disposal) to make a better survey than half a dozen competing bidders. But there are no grounds for the statement that quantity surveying would of itself improve any architect's plans or require better plans than the contractor now gets. No quantity surveyor would guarantee absolute accuracy from inaccurate plans. In such a case the contract should be let on the basis of quantities as a unit-price job. It has been objected that those who have special ability in scaling quantities will lose their advantage compared with those who have not this ability. Yes, and those who learn arithmetic at school also have an advantage over those that have no education. Let us examine this contention and see whether it holds water. Seriously, how many men have such skill in scaling quantities that they can view with complacency the continuance of present conditions, and are willing to waste time on fruitless estimating. There are very few that feel that they have a decided advantage in this—such an advantage that they don't care to forego it, and how much of an advantage is it? Does it get them a large proportion of jobs, or is it a fact that, owing to their skill in scaling and their care, their estimates are higher than those of their less fortunate rivals, who discover too late that they have "left out something." The true competition is in judgment as to pricing, and the real contest, even to-day, among the better class of estimators, is, and should be, in the ability to foretell what a difficult piece of work will cost and how it will be performed. The architect and owner think that Brown and Jones both know exactly what each item in the building will cost, and if Brown bids lower than Jones it is because Brown can work cheaper than Jones. This is very far from being true—the reverse of this is often the case: that although Jones bids higher than Brown, his work is actually cheaper in execution; but he knows costs, and Brown doesn't, and Brown guesses too low, and makes no profit. I am often asked how many of the unit prices in my estimates turn out accurate, and people are incredulous when I say that none ever are accurate. The estimator can only hope to get somewhere near the truth, and the better the estimator the nearer the facts he gets.

It is claimed that not only will contractors all be on the same basis, but that many more incompetents would come in and secure quantities which they themselves could not draw off. There are two sorts of incompetents: a man may be a good calculator, but a poor builder; or he may be a good builder, but a poor man at figuring quantities. The first man you have figuring against you already; the architect is the only man who can eliminate him. If you also bring in to compete with him men who do better work, but who are not able to show the same skill in arithmetic, I do not think any further hardship will be suffered. We must not think, however, that all troubles and disputes would be eliminated by the adoption of quantity surveying. As long as human nature remains what it is disputes and troubles will arise. But one class of disputes will be almost abolished, and that is the disputes over ambiguous clauses in the specifications and indefinite work on the plans. The quantity surveyor will make a careful scrutiny of the plans, and many points of doubtful construction will arise which, by his close connection with the architect, he could solve. In any case, his interpretation of the plans is accepted by the builder and guaranteed by the owner, and if it is found that there is any

error the builder does not suffer. If you are all convinced that quantity surveying is the right way to get competitive bids you will, of course, want to know where the quantity surveyor will come from. Will he spring, like Minerva, from the head of Jove, ready for work, or shall we import him or spend some years training him from our ranks? How shall we start him to work? Shall we all refuse from now on to bid unless quantities are furnished, or shall it be a slow development? The logical men to be our first quantity surveyors would be the chief estimators of our large firms of building contractors. These men would find capable assistants from the ranks of engineers' draughtsmen and architects' draughtsmen, especially engineers' draughtsmen, part of whose early training comprises the acquisition of a sound knowledge of the principles of construction. I believe that very efficient assistants can be secured in these directions.

The method of making a start will vary so considerably in different cities that I have thought of three methods in which a quantity system may be organised in a city, and these I want to present to you in order. If the owner of a prospective building is convinced of the advantages of the quantity system the simplest method would be for the architect to appoint a man as quantity surveyor, choosing one from his acquaintance who is qualified to do this, or asking the secretary of the local builders' exchange to appoint a fit man for him. If the owner or architect is still opposed to the quantity system, there is no reason why it should not be put in force without their assistance, if the builders of an exchange have proper confidence in each other. They could meet together and agree that one of their number should prepare a schedule of quantities for the work. If this man was not one of those who were bidding on the job, this would be an added advantage. He could furnish the copies of his schedule to the competing bidders, and they could price them out and bid upon them. In this case, payment would have to be made to the man who had prepared the quantity schedule, either by each builder agreeing to pay in proportion of the cost, or else for each builder to add the whole cost of the schedule to his estimate, and then the successful bidder would pay the whole charge, and the others would be put to no expense whatever. The owner would reap no advantage from such a proceeding except a possible saving of expense by closer bids. I do not consider that there is anything improper in this procedure. The cost of estimating in this way would not be as great as the present cost of estimating, and there is no more impropriety in such a proceeding than there is in half a dozen builders taking bids from the same material man or sub-contractor. The fact that they have paid a fee for the estimate does not render the transaction a wrong one. Not infrequently I am accustomed to pay fees to sub-contractors for the purpose of getting careful estimates from them on work which I wish to be free to let as I wish, if we secure the job. The cost of such fees I always add to my estimates, although, of course, they come out of the pocket of my company in case we do not secure the work. A third method which I have noticed commends itself very highly to me. In the city of Milwaukee, Wisconsin, they are organising a Bureau of Quantity Surveying. This is subscribed to by the chief contracting firms in the local builders' exchange. The organisation will be made up of the chief estimators in the city, who will receive fixed salaries for their work. Every member of the exchange will subscribe a sustaining subscription to the bureau, and, in addition, will pay a small fee for the use of each bill of quantities. He will also add to the amount of each bid he makes on quantities furnished by the bureau a percentage varying from 1 to 2 per cent. for these quantities, and if he is successful in getting the job he will pay this fee to the bureau, unless the owner pays it direct. At the end of the year any surplus will be divided among the contributing builders. A fourth method might be for any party to make a schedule of quantities on "spec," and offer them for sale. This method does not commend itself to me.

In the second and third cases it is contemplated that the builders themselves will make themselves responsible for the payment of the quantity surveyor. I am not at all sure that it will be possible—it may not be easy—to so convince architects and owners of the value of quantities that they will be willing at first to pay for them, and, therefore, it is up to the builders to make a start themselves and install the system, as was done in England many years ago. It was not for a long time that architects or owners realised that there was any advantage to them in the use of the quantity system. When they did they took charge themselves of the appointment of quantity surveyors and the common law established their liability for fees. If builders want quantities furnished they will have to show the way by furnishing them among themselves. The owners' co-operation will come later. If I am right in my surmise that builders will at first have to bear the direct expense of a quantity system, it has been suggested that this will be frowned upon on the ground that the public would feel that there was collusion between the bidders. It is certain that in some quarters there will be suspicion as to the propriety of this procedure. But it does not follow that because there is co-operation there is also collusion between builders. The builders of this city co-operate in maintaining the builders' exchange, and are, we trust, on friendly terms with each other in other ways as well. But this does not imply any collusion between them. We are getting beyond the days of Pickwick, who was so horrified because his counsel, Snubbin, civilly greeted Serjeant Buzfuz just before the beginning of the Bardell trial. But it is just such an attitude as this that prompts the suspicion of collusion if quantities were used. Co-operation is doing so much in other lines of business, in spite of the suspicions of the public, that it ought to be allowed here. Collusion is an ugly word, and usually implies fraud. But there can be no wrong in a band of men agreeing to appoint one to do work to save themselves the trouble of a lot of computation, provided that each estimates his costs independently and prices his estimates himself.

What fee ought to be charged for the services of a quantity surveyor? It is not easy to set a fee right off that will apply in every case. In England, the maximum fee is usually a percentage of the lowest bid, and ranges from 2½ per cent. on dwelling-houses, churches, and other work which contain a very large amount of detail, down to as low as 1 per cent. on large plain, simple factory and warehouse work. Although at first sight this fee of 1 per cent. on a 100,000 dol. factory will look large, yet as I have pointed out, the cost of an estimate on such a factory at the present day is more than this; but the cost is spread around among the community, instead of being concentrated in one payment to one party. The only estimating expense incurred by the builder under the quantity system will be the time spent on pricing the estimate, visiting the site, and making inquiries from the material men. This will take very much less time than any attempt to scale the quantities, so that the contractor's expense of estimating will be practically negligible. It is very important that proper fees should be charged from the start. If fees too low to pay for painstaking, accurate work are established, the work will not be done carefully. It will be extremely difficult to raise them, and the system and the whole movement will suffer.

There will undoubtedly be difficulties to be encountered by the starters of the quantity system. The first point that is sure to be raised will be, What will happen if a mistake is found in the quantities? I do not suppose that any estimate of quantities is perfect in every respect, although I have found that most quantity surveyors' estimates of quantities were surprisingly accurate. Yet I have known of errors of considerable amount being found in bills of quantities, and the point arises at once, How are they to be adjusted? In the first place, it is obvious that if the owner has paid for the bill of

quantities, and has guaranteed to the contractor that the bill of quantities is correct, if any error in quantity or description is found, the cost of making good such error should not fall upon the contractor, who has used the quantities in good faith. It then rests between the owner and the quantity surveyor as to who shall pay. There are some that argue that the owner should pay; others that argue that the surveyor should pay. Taking the first case, the owner does not call upon the architect to pay for mistakes made in the design of a building, or the omission of items from his specification. The architect being engaged by him in a professional capacity to render service, as long as he renders that service to the best of his ability, he is not held liable for errors. Nor does the owner expect any guarantee that the building will not fall down through faulty design. Only in the case of gross, culpable, or criminal negligence will the Courts hold him liable for errors; and if an architect has forgotten to specify the painting, or, through some error, figures the overall dimension of his building incorrectly, the cost of making good such errors falls upon the owner, and it is therefore argued that the surveyor's contract of service should be of the same character.

On the other hand, if the quantity surveyor is to justify his existence at all, the owner will expect that he will offer some guarantee of his work being accurate. I do not see any real objection to his doing this. The men called upon to take off the quantities will at first look upon such a requirement with some fear; yet they will find that, under the different conditions under which they will work, having proper time in which to do the work, and proper opportunities of studying the plans with the architects, their work will be more carefully done and will be more accurate. Then, if a proper fee is paid for the quantities, they will be able to afford to have all their work checked, and thus minimise the liability of error. In an English office, every operation is checked before the next one is made, and mistakes are surprisingly few. In a general way, English quantities are supposed to be correct within one-half of 1 per cent., and I believe they are. Of course, it often happens that one item is slightly in excess, and another item is equally too small, such as different kinds of flooring in the same building; but it is not often that the totals add up incorrectly. The Quantity Surveyors' Association of England makes it a requirement or rule of membership that every member shall guarantee that his quantities are accurate, and shall refund to the owner any expense to which he is put by reason of inaccurate quantities—provided, of course, that correct and properly-drawn plans were furnished him before he started to take off. In an article by a past-president of the Quantity Surveyors' Association in the "American Architect" for March, he states that so far it has not been necessary to call upon a single member to make good under this guarantee, which is evidence enough of the possibility of making accurate estimates of quantities from proper plans. For myself, then, I should have no fear in guaranteeing that my work would be correct, and I believe that other men who started in this line of work would before long feel sure enough of themselves to do so, too. But it will be objected then by the owner that the guarantor is not a man of sufficient financial standing for his guarantee to be worth anything. This difficulty I am not able to suggest a solution for, except in the case of the bureau already mentioned. It is certain that quantity surveyors will not be recruited from the ranks of capitalists, and, however willing they may be to guarantee their work, if they cannot put up collateral for their guarantees, the guarantees will not be worth much to the owner. The question of accuracy and guarantee, however, does not seem to me to be a very important one, owing to the very few cases in which it is actually needed in settlement. It is one that will take care of itself. If a quantity surveyor has to depend for his professional reputation and standing on the accuracy of the work he does

there is no more chance of his doing careless and inaccurate work than there is of the architect or engineer whose standing depends on the quality or permanence of the work he designs, or there is of the contractor whose reputation depends on the quality of the workmanship he furnishes.

I have been asked what will happen if the accuracy of a bill of quantities is questioned, and the surveyor who drew off the quantities is required to check them after the building was completed. Such cases sometimes occur, and I have been challenged on quantities that I have prepared as to the accuracy of some items, or of the whole building. I have always offered to measure up the work in dispute on this condition: that if the party who made the request was found to be in error, he should pay the whole cost and a proper fee for the time spent in measuring. Further, I was not content to measure one small item, but would measure all the work relating to same. For instance, if it was claimed that the maple flooring was short in a building floored partly with maple and partly with marble, I should insist on measuring the whole of the flooring, and should very likely discover that the quantity of marble flooring was less than the estimate, and the quantity of maple flooring more. Other cases have occurred where the building was so changed that the whole building had to be measured up again at the close by reason of changes in plans and requirements of the owner. In this case, of course, the cost of measuring should properly fall upon the owner. If, however, a measurement of a building showed serious errors in a surveyor's work, the cost of making such measurements would certainly fall upon the surveyor, and the cost of adjusting the errors would fall either on the surveyor or owner, according to whether the surveyor had made a guarantee to the owner or not.

I may be asked how the surveyor would deal with items which are uncertain in character at the time the plans were taken off—such as foundations, where it is expected to meet with bad ground. In such a case it is usual for the surveyor to take off quantities for whatever work he considers would be likely to be needed, and he would mark these quantities as being provisional, and insert a note in the schedule of quantities that such work was to be measured and valued when executed. When the work had been put in, he would, therefore, visit the work, measure the actual work done, and deduct or add the cost of it to the items already taken in the estimate. For this, of course, he would be paid a proper fee in proportion to the fee paid on the original quantities.

One feature of the quantity system as used in England would be looked upon with mixed feelings by contractors here, although welcomed by architects, and that is the settlement of extras. It does not follow that because a bill of quantities has been made the basis for estimate, it must therefore be used as a basis for settlement of extras, unless it is so provided in the contract. A contractor may base his bid upon quantities, and may refuse to sign a contract that called for them to be used as a basis for extras. But if he does so agree to use the quantities as a basis of extras, one great bone of contention between architects and builders is removed, and better relations are at once established. There is no more thorny and difficult subject that comes between architect, owner, and builder than the value of extra work. The quantity system provides a method for the measurement and valuation of most items of extra work or omitted work, for if the contractor puts the unit price of each item in his bill of quantities, and deposits same with the architect, a definite basis is laid down for the valuing of extras. Many builders fear that such figures would be used against them, and would refuse on that account to do so. This need not deter them from using the quantity system in making up their bids. As far as my own experience goes, on both sides of the water, I have never found that a builder suffered any real detriment by letting his prices be known. Prices are no longer a trade secret.

We do not keep trade secrets from each other in the way that we used to. As far as I am concerned, I have no hesitation in letting anybody know what prices I am using in pricing an estimate, or how I make them up. As far as the speciality of my own firm goes—reinforced concrete—I recently contributed several chapters to a book on the subject, in which I laid bare the whole of my methods in pricing reinforced concrete work, and have never hesitated to give similar information to anyone that asked for it. This has never resulted in any loss to my company. (See "Reinforced Concrete," Vol. II., by G. A. Hool. McGraw Hill Book Company.)

Of course, the bill of quantities would not provide a basis of settlement for extras which by their nature could not be measured, such as the cutting into and alteration of work already built, and of items which could only be charged as day work. In the English system such items are valued by an examination of the contractor's time-sheets and material records. Some difficulty might arise if nine builders agreed to use the quantities, and the tenth refused. In such a case, either the architect could refuse to consider the bid of the tenth, or else the contractors using the system would have to bid under a certain theoretical disadvantage—that is, the disadvantage of carrying the quantity surveyor's fees in their bids. It is, however, probable that this would be offset by the greater accuracy of the quantities they figured on, and by the fact that it would not be necessary to add any profit for contingencies to cover any unforeseen expense, as a proper bill of quantities would cover all points and guarantee the contractor against errors of quantity.

The relative position of sub-contractors and material-men would not be materially altered. The contractors would each supply to their sub-contractors copies of those portions of the quantities which related to their work. These they would use as a basis for their estimates for the contractor. I believe, however, that, with a little experience and care, any general contractor should be able to price sub-contract work himself. In this case he need not call in his sub-contractors until he gets the job, and this will eliminate all the evils of trading sub-bids, that are such a perplexing problem in our cities to-day. One of the greatest difficulties ahead of the establishment of quantity surveying is the subject of standardisation of measurements. It is an unfortunate fact that in no trade is there any agreement between contractors as to how any items should be measured. Take, for instance, doors and windows. There is no method whatever of measuring a door or door-frame or trim that is universally used. Most carpenters will look at the plan of an opening, and say, "Yes, that will cost you 20dol. an opening," or 30dol., or 15dol., as the case may be. When we come to brick-work, some masons measure the net cubical content of the brick; others will measure all corners double; others will not deduct openings; some will deduct half-openings, and some will not deduct stonework where stonework is embedded in brick, and others will. Then, having found a final quantity of cubic feet, some will multiply this quantity by 19 brick, some will multiply by 22, 23, and up to 25 brick, to arrive at the number of thousands of bricks to value. When you take the case of concrete, some contractors measure their forms, and some do not—simply add so much to the price of the cement and aggregate for the forms; and of those who do measure the forms, some measure the square feet, and some measure the number of board feet used, and so on. When we come to plastering, some plasterers deduct openings, and some do not; and so on, in every trade there are found these wide divergences of opinion and method as to the proper way of valuing their work. These ways cannot all be right, and it will be necessary to determine some definite standard or method in which such an item should be measured before quantity surveyors can get very far with their work. It will be necessary for the contractors in each city who intend to use the quantity system to get together and establish some definite standards of

measurement which shall be adopted by all. As far as concrete is concerned, this has already been done by the American Concrete Institute, who a year ago adopted standards which had been prepared by a special committee of which I was a member. These standards are in use in many parts of the country, and will eventually be adopted, I believe, in all parts of the country. It is to be hoped that national standards of measurement in other trades will also be established.

In drawing up a standard of measurement, I believe that two guiding principles should govern, although these may conflict with existing practice in many cases. The first rule is this—that all work should be measured net as fixed in the building, no allowance being made in the measurements for waste; that is to say, the quantity of brickwork measured should be the net quantity of cubic feet that will be found in the finished building. The quantity of flooring will be the net square feet that can be measured upon the finished floor; the quantity of plastering will be the net area covered by the plasterer, and so on. Then each contractor will add to his price the amount of money he considers necessary to cover the waste. Waste varies with every contractor. One contractor laying a floor will use 5 per cent. more flooring than another; one contractor in laying-up brickwork will, by reason of his better handling, break 2 or 3 per cent. less than a rival; and the same applies to pipe-fitters, plasterers, or any other trades. Therefore, so that there may be one definite, common basis which can be measured without dispute, and on which all can figure, it is necessary that everything be measured net as fixed in the building. And the second rule is that material should in no case be measured to pay for extra labour. If a plumber is measuring 100ft. of 1in. pipe in which there are ten elbows and three tees, it is wrong in principle for him to count each elbow as 2ft. of pipe. The value of each elbow may be the same as 2ft. of pipe; but it is wrong for him to call an elbow 2ft. of pipe, and thus get 150ft. in his quantity when there is actually only 100ft. to be measured in the building. If he wants to, the elbows and bends and tees can be counted and enumerated separately; or if not—if it is not worth while doing this—the net 100ft. should be measured, and the price should be increased to cover the cost of the bends and the tees. In brickwork, in the same way, it is not correct to leave in the brickwork which really is displaced by stone, on the ground that the labour of setting the stone is equal to the cost of the brickwork. The labour of setting the stone is measured as a separate item, and the net quantity of brickwork should appear. In this connection I would remark that it seems to me to be a very bad practice to price brickwork by the thousand bricks. The correct unit for measuring and valuing brickwork is the cubic foot, and a quantity surveyor will have to use this basis, as then every builder, in pricing, can allow the number of bricks that he considers necessary to the cubic foot in his quantities.

In conclusion, it would be well to state that I do not believe that the adoption of the quantity system would prove a panacea for all ills, or would remove all sources of trouble or dispute, but that it would be a real advance, and remove some of the abuses current in the building trades, and would help towards a better understanding all round. It will certainly be a difficult matter to establish a satisfactory system in this country. In doing so, we should not be bound by any customs of other countries, although we should follow them so far as the principles they have adopted are right principles. The subject of standardisation of measurements will be a very important step towards the establishment of a proper system, and, whether a quantity system is ever established or not, there is an urgent need for a proper understanding of the methods of measurement of work in the building and engineering work. This would be a very useful field for the activities of some of our national associations of engineers, contractors, and sub-contractors.

LONDON COUNTY COUNCIL.

In November last the London County Council made by-laws under the London Building Act, section 164, for the regulation of lamps, signs, or other structures overhanging the public way not being within the City. A copy of the by-laws was sent to the Local Government Board for allowance, and one was also sent to each metropolitan borough council, the Ecclesiastical Commissioners, the Royal Institute of British Architects, the Surveyors' Institution, the London Chamber of Commerce, and the Institute of Builders, as required by the London Building Act of 1894.

The Local Government Board has now intimated that the by-laws have been considered in connection with the observations forwarded by local and other authorities concerned. It is suggested that a proviso should be added to by-law No. 1 exempting from the operation of the by-laws cases of re-erection or replacement of any lamp or structure supporting or carrying the same, or the substitution of any lamp or structure supporting or carrying the same for an existing lamp or structure, where the lamp or structure has been fixed or fitted before the date of confirmation of the by-laws; and further, that the local authority should be given seven days' instead of two days' clear notice of intention to fix or fit any lamp, sign, or other structure coming within the scope of the by-laws. The Building Act Committee reported on Tuesday to the County Council recommending that these modifications, together with one or two others of a minor character which have been suggested by the Board should be agreed to, and submitting the by-laws amended accordingly. The Council approves the by-laws as amended, but it will be necessary for them to be confirmed at a subsequent meeting and for the preliminary requirements of section 164 of the London Building Act, 1894, to be complied with anew. The Local Government Board will also be asked to fix a date on which the by-laws, which are not retrospective, will come into force. They are as follow:—

1. A person shall not after the date at which these by-laws come into operation fix or fit any lamp or any structure supporting or carrying the same, nor shall he retain any lamp or structure supporting or carrying the same fixed or fitted after such date so as to overhang the public way in such manner that any part of such lamp or structure respectively shall (i.) be at a less height than 8ft. clear above the surface of the footway immediately under such lamp or structure, or (ii.) be nearer to the carriageway than 2ft. 6in. from the outer edge of the kerb, or (iii.) project more than 3ft. from the wall or shop front of the premises or the post or upright support to which it is attached.

Provided that this by-law shall not apply (a) to the re-erection or replacement of any lamp or structure supporting or carrying the same which has been fixed or fitted before the date of confirmation of these by-laws, if the interval between the removal and the re-erection or replacement does not exceed six months, (b) to any lamp or structure supporting or carrying the same which is substituted for a lamp or structure which has been fixed or fitted before the date of confirmation of these by-laws, if the interval between the removal of the one and its replacement by the other does not exceed six months and the substituted lamp or structure does not exceed that for which it is substituted in weight or dimension and does not in situation contravene this by-law to a greater extent than the lamp or structure for which it is substituted.

2. A person shall not, after the date at which these by-laws come into operation, fix or fit any lamp which, including framework and ornaments, exceeds 3ft. in any part when measured in any direction horizontally, or which, including framework and ornaments, exceeds 5ft. in height, or which weighs more than 30lb., nor shall he retain any such lamp so fixed or fitted after such date so as to overhang the public way. Any lamp which may lawfully be fixed or fitted under this by-law shall be provided with a secondary means of security of sufficient strength to sustain safely the whole weight of the lamp against falling away from its support.

3. A person shall not, after the date at which these by-laws come into operation, fix or fit any sign or any other structure supporting or carrying the same or any other structure nor shall he retain any sign or structure supporting or carrying the same or other structure fixed or fitted after such date so as to overhang the public way in such manner that any part of such sign or the structure supporting or carrying the same or other structure respectively shall (i.) be at a less height than 5ft. clear above the surface of the footway immediately under such sign or structure, or (ii.) be nearer to the carriageway than 2ft. 6in. from the outer edge of the kerb, or (iii.) project more than 3ft. from the wall or shop front of the premises or post or other upright support to which it is attached. Provided, nevertheless, that if any such sign or structure shall extend more than 2ft. (not including stays or supports)

along the face of such wall, shop-front or support, then such sign or structure shall not project more than 2ft.

4. A person shall not, after the date at which these by-laws come into operation, fix or fit any sign or other structure which exceeds 2ft. 6in. in height or extends more than 6ft. in any direction (not including stays or supports) along the face of the wall or shop-front of the premises or post or other upright support to which it is attached nor shall he retain any such sign or other structure so fixed or fitted after such date so as to overhang the public way.

5. A person shall not fix, fit or erect any lamp, sign or other structure coming within the terms and provisions of these by-laws unless and until seven clear days' notice in writing, of intention to fix, fit or erect such lamp, sign or other structure shall have first been given to the local authority.

6. The London County Council, after consultation with the local authority, may in any case in which it may consider it expedient so to do dispense with the observance of any of the foregoing by-laws on such terms and conditions (if any) as it may think proper.

7. Any persons who commits any offence against any of the foregoing by-laws shall be liable for every such offence to a penalty of £5, and a daily penalty of 40s. for every day during which such offence continues after conviction.

8. These by-laws shall not apply to—

(a) Any fascia, balcony, shelter, covered way or other projection overhanging the public way (not being a lamp, sign or other structure within the meaning of these by-laws) which has been or shall at any time hereafter be duly sanctioned by the London County Council under the London Building Acts or any other statute in that behalf.

(b) Any movable sun-blind overhanging the public way, no part of which, or of the stay-bars or other fittings of which, except any valances or side blinds, shall when open be below an imaginary straight line drawn from a point 7ft. above the footway at a distance of 2ft. from the outer edge of the kerb to a point 7ft. 6in. above the footway adjoining the front of the shop or premises to which such blind is fixed or fitted, and which shall not be nearer in any part to the carriageway than 1ft. 6in. from the outer edge of the kerb, or any valance or side blind which does not project more than 2ft. from the front of the shop below the level of 7ft. 6in. above the footway.

(c) Any lamp or structure supporting or carrying the same overhanging the public way which may be fixed or fitted at not less than 7ft. 6in. in the clear above the surface of the footway immediately under such lamp, and so as not to project in any part from the line of the window-frame of the shop more than 3ft. and so as not to be nearer to the carriageway than 2ft. 6in. from the outer edge of the kerb, and which shall be solely for the purpose of illuminating such window from without, the lamp itself not to exceed 36in. in height, 24in. in width parallel to the face of the building, and 24in. in depth from front to back of lamp in clear, including any ornamentation and chimney.

(d) Any gas-rail or pipe overhanging the public way used for the purpose of illuminating shops from the outside which has not a greater projection than 2ft. from the shop front, and which is not less than 7ft. 6in. above the surface of the footway immediately under such rail or pipe.

(e) Any daylight reflector or prismatic light overhanging the public way which has not a greater projection in any part than 2ft. 6in. from the face of the building to which it is attached, and which is not less than 7ft. 6in. above the surface of the footway immediately under such reflector, and which is securely fixed.

(f) Any lamp provided by a local authority for the purpose of lighting a street.

EARLY RENAISSANCE ARCHITECTURE IN ENGLAND.*

In this second edition of a book which at once made its mark when issued thirteen years ago, Mr. Gotch has done well to omit some of the illustrations, and compress the text, thus reducing the bulk of the original volume and reducing the price. Otherwise very few alterations have been necessary, and these simply bring the text into line with results of more recent researches.

To none who know the book is a single word of recommendation of ours necessary. To those who do not, we need only say that it is based on real practical acquaintance with its subject, and written with discriminating appreciation of the charm of the work of the Tudor, Elizabethan, and Jacobean periods.

Very few have had the author's experience and opportunities of obtaining reliable information, and none have surpassed his capacity for imparting a knowledge of his subject. His style is lucid; there is no affectation of professional phraseology; and each illustration is utilised to explain some point in the text, not dragged in, as by the mere bookmaker, to swell the volume.

Not merely to architects will the book commend itself, but to the wider circle of crafts-

* Early Renaissance Architecture in England. By J. ALFRED GOTCH, F.S.A., F.R.I.B.A. London: B. T. Batsford, Ltd. 15s. net.

men, antiquaries, travellers, and, indeed, all cultured people who love the picturesque halls and manor houses which remain as the monuments of the great house-building period covered by the reigns of Elizabeth and her successor. Many such will understand for the first time how the builders of the time obtained their delightful effects, thanks to Mr. Gotch's judicious selection of illustrations—not merely of exteriors and interiors, but elucidated as it is by details of all contributory features.

EXHIBITION AT THE ROYAL ARCHITECTURAL MUSEUM, WESTMINSTER.

The President and Council of the Architectural Association entertained the friends of the Schools on Wednesday last at "a smoking evening," and availed themselves of the opportunity of showing, in the architectural classrooms and galleries, the assemblage of students' drawings from the recent Exhibition of British Architecture in Paris, representing the Schools of the Royal Academy, Royal College of Art, London University, Liverpool University, and the First Atelier of Architecture, besides work done in the Architectural Association Schools, and also a selection of R.I.B.A. prize drawings. The exhibition will remain open till July 18, and will well repay a visit.

Much of the work is individually worthy of unquestioned praise. Mr. L. H. Bucknell, of the Premier Atelier d'Architecture, sends an excellent and large study of a big building, seemingly intended for an art gallery standing by the side of a lake. Next to this is a dashing design for a park entrance, unequal in the scale of the gate piers, by Mr. Robert Lawry. The Glasgow schools turn out very capital executants, and Scotch students have for years furnished the ranks of our leading architects and prize winners. There is a Colonial Parliament House, with an Ionic Order to the colonnaded entrance and sculptured figure groups delicately and charmingly suggested in light lamplack, by Mr. Richard W. M. Gunn's drawing. Mr. Spencer Willmott has a design of merit for an Institute of Architects, and we suppose he is the author of a plan below of an institution with architectural galleries and sculpture courts. The Higher Grade School is represented by Mr. E. S. Wylie, who sends a block of municipal buildings. Mr. A. G. Paton, of the Glasgow School, shows a feelingly-drawn pencil study for an interior doorway, which, however, is overwrought with detail. The other entrance, with rusticated masonry, on the same mount, is much more strong and fit. There is a nice small law-court design by Mr. Alex. T. Scott.

We thought the Clock Monument, inscribed with mural tablets, "Aquarius," "Pisces," and "Aries," on the front face, by Mr. W. E. W. Terrell, an accomplished performance, with a bronze group at top and a figure plinth at the base. One of the most striking studies which we noted was the Lever first prize view of new frontage to the Port of Liverpool, by Mr. H. Chalton Bradshaw, with a pair of campaniles ending up the series of towering capped buildings, cleverly shown with boats and craft, graphically artistic and suggestive. The same hand is responsible for a Bandstand and Sketch for a Picture Palace. The Liverpool School sends a Monument by Mr. F. Jenkins, with a Doric handling of an obelisk like tower, with globe on the summit. Mr. Bernard A. Miller won the first Lever Prize for a group of municipal buildings in the French modern mode, with a vast campanile tower in the midst, beyond a clever courtyard.

Among the Scholarship candidates we saw a monumental obelisk to record the dead, by Mr. E. A. Turner, standing on rocks, with recumbent lions guarding the sepulchre in this Portal of the City of the Dead. The Council Office, by Mr. J. Bernard M. Walsh is of a less severe manner, with adept drawing and good detail.

Among the measured drawings is a set of the Royal Hospital at Chelsea by Sir Christopher Wren, and here finished in colour by Mr. Philip S. Hudson. The Porch of

Linlithgow Church is sketched by Mr. Philip Shaw in good line, spiritedly done. The Hotel de Ville, Beaucaire, by Mr. Archie B. Young, and Melrose Abbey Ritual Choir, faithfully rendered in good scale by Mr. Wm. Cruickshank.

AN OVERLOOKED TENDER.

The discovery of an unopened tender for the building of a new Wallasey Council school in Valkyrie-road, Liscard, after the committee had met and recommended the acceptance of the tender of a Liverpool firm for £18,107, entailed the convening of another meeting of the education committee a few days later, the rescinding of the previous resolution, and the acceptance of the tender of Messrs. Duthie and Son, of Liverpool, for £17,750. Alderman Dr. Oldershaw, who presided, explained that after the committee met another tender was found in the clerk's office, where it had been all the time the committee was sitting. He, therefore, thought it right that the committee should meet again to consider this tender with the others. He might say that the following morning another tender, posted in Liverpool at 9.30 on Monday night, arrived, while two others had been received since. He did not suggest that either of these should now be considered, as they should have been received not later than noon on Monday, and they were probably only sent in order to obtain repayment of the guinea deposited when the specifications were obtained.

The deputy town clerk explained that the tender in question was handed to the town hall-keeper by messenger at 6.10, while the committee was actually sitting, and he placed it in the clerk's office instead of handing it at once to the town clerk. Alderman Swanwick said that as this tender was not handed in before twelve o'clock the conditions had not been complied with.

The deputy town clerk: Some of those considered on Monday evening came during the afternoon.

It was agreed that the minutes of the education committee meeting be rescinded, and that the tenders be considered afresh.

It then transpired that the lowest tender was that of Messrs. Duthie and Son, of Liverpool, for £17,750, this being the particular tender in question. It was mentioned that this tender for schools for 1,200 children worked out at £14 15s. 10d. per head, compared with £15 6s. for the Church-street schools, and about £13 per head for the Poulton, St. George's-road, and Vaughan-road schools. The tender of Messrs. Duthie and Son was then accepted unanimously.

MODERN PLUMBING PRACTICE.*

Messrs. B. T. Batsford, Ltd., are publishing three useful volumes—of which this is the first—on Plumbing Practice. This deals with lead-working and plumbers' materials; the second will describe Modern Sanitary Plumbing; and the third, Lead-working on Roofs. The late Mr. Wright Clarke's former work has been out of print some years, and it is to be regretted he was not spared a little longer to complete this. That it is based on actual personal knowledge is evident. The volume opens with an elementary description of the metals used by plumbers. Chapters are devoted to casting lead into sheets and other forms in which it is used by plumbers. In this section much of the work illustrated may appear to be crude and unfinished. The author's reasons for introducing such work, some of which was done by students attending plumbing classes under his charge, was to show readers that there are higher grades of plumbing than simply repairing water-pipes; also, that if young students were capable of doing such work, surely skilled craftsmen could produce more highly-finished specimens, and execute any class of lead-work, either plain or ornamental, that an architect might design in connection with his buildings.

*Modern Plumbing Practice. By the late J. WRIGHT CLARKE, M.R.S.I., and WALTER SCOTT, A.R.S.I. R.F. Vol. I. London: B. T. Batsford, Ltd. 10s. net.

Lead-casting and lead-burning are treated in a fairly exhaustive section. A section has also been devoted to setting out the lines for and making pipe-bends and elbows with the view to enable the workman to avoid a useless waste of energy in partially preparing a piece of work and then placing it in its position to ascertain if it is being made to the proper shape. The chapters on making soldered joints are carried as far as possible. It is obvious that the skill necessary for the actual execution of such work can only be obtained by practice, and not by studying written descriptions. Lead-light glazing and the subject of siphons are also adequately dealt with.

For the post of professor of architecture at the School of Design and Decorative Art, at Molenbeek, Brussels, after a keen competition, M. Henry Van Montfort has been appointed.

Devon County Council decided on Friday, in spite of much opposition, to expend £800 in carrying out alterations and repairs to Larchmont, Torquay, for the purpose of a tuberculosis hospital and dispensary.

At Dudley Mr. Edgar Dudley held a Local Government Board inquiry on Tuesday into an application by the corporation for sanction to borrow £3,280 for purchase of property required for street improvements.

The fine peal of bells at St. Gregory's Parish Church, Sudbury, Suffolk, which have not been rung for four years, have been taken down and sent to the works of Messrs. J. M. Warner and Sons, Spitalfields, to be retuned. The framework in which they hung is being reconstructed.

A Local Government Board inquiry has been held at Pudsey into the application of the town council for permission to borrow £10,159 for the construction of public swimming-baths, fire-brigade station, the purchase of a motor fire-engine, and the extension of the highways department offices.

At Winnipeg, the contract to erect a new warehouse for the Ames-Holden-McCreedy Company has been let to the Lyall, Mitchell Company, at about 100,000dol. The building will be six stories high, of mill construction, brick and stone. The architect is Mr. J. D. Atchison.

A new Roman Catholic church and priest's house is to be begun shortly at Southwold, East Suffolk. The buildings will be constructed of Weldon stone, from a design by Father Benedict Williamson, C.S.S.R., of Earlsfield. The Bishop of Northampton will lay the foundation-stone next August.

The competition in Belgium for the Grand Prix de Rome d'Architecture has just been decided. M. de Mel, of Antwerp, was placed first with 81 points; for the second and third places M. Bar, of Ghent, and M. Brossen, of Antwerp, were named equal with 76 points each; M. Van Limputtin, of Antwerp, came fourth with 74 points; M. de Bels, of Antwerp, fifth, 70 points; and the sixth and seventh places were equally divided between M. Smekens, of Antwerp, and M. Sterdiau, of the same city, each with 64 points.

At the last meeting of the town council of Cambridge the public health committee reported that as the contract for the additions and alterations at the infectious diseases hospital had been signed, it became necessary that a clerk of the works should be appointed to supervise the erection of the buildings. The committee therefore gave instructions for advertisements to be inserted in the BUILDING NEWS and the local papers inviting applications for the post at a salary of £4 4s. per week. Twenty-four applications were received, and the committee recommend the appointment of Mr. Ingle Garner, of 99, Victoria-road, Cambridge, who would be able to enter on his duties immediately after the appointment.

The foundation-stone was laid last week at Hereford of the first of three groups of municipal houses for working-men now in course of erection at Hereford. At Edge Mill, 16 houses will be erected—three in blocks of four houses, and two of two. The buildings here will consist of living-room and kitchen, stone larder, coal-place, and w.c., on ground floor, and three bedrooms upstairs. Beside the copper bath will be built against the wall, it is provided with a top, which may be used as a table. On the Mostyn-street site 20 houses are to be built, and on the Crozeus site, four houses. The plans have been prepared by Mr. J. Parker, the city surveyor; Mr. George Field, of Birmingham, is the contractor, and Mr. W. Jakeway is the clerk of works.

Currente Calamo.

Monday's meeting at the R.I.B.A. resolved to empower the new Council to employ the solicitors to prepare a draft of the whole Charter by Registration scheme, to be submitted "informally" to the Privy Council—whatever that may mean. In any case, it will come before a general meeting next session, we suppose, for confirmation. We are glad, anyhow, that Mr. Sydney Perks's amendment was defeated by a large majority, and congratulate the presidents of the allied societies on their large attendance and their successful stand against their limited representation on the Council. Every speech was to the point—especially those of the president of the Manchester Society and Mr. J. A. Gotch. The provincial societies will do well to make their presence and influence still more and more felt. They are the majority, as regards membership, and in many respects they may be relied upon to sustain and encourage progress in a greater degree than the London members. They are also, as Mr. Grayson well put it, the "police" of the central body, and without them the Institute could not long exist. It is, therefore, their right to have the fullest share in the control of its policy.

The negotiations for a sectional settlement of the London Building Trade dispute are proceeding. The Stonemasons have met the London Master Builders' Association twice since our last issue, and on Wednesday night decided to agree to the terms arranged, with one small exception, and will return to work early next week. Nine other unions are negotiating terms. The Wood-cutting Machinists, the Engine and Crane-Drivers, and the Painters' unions have applied for interviews, and the representatives of the two first-named societies will meet the London Master Builders' Association to-day. Meanwhile, readers will do well to disregard the obviously untrue and stupid statements by which the mischief-making militants are still seeking to hoodwink the men, on the one hand; and, on the other, to suspend judgement with regard to the appeal made by Mr. W. Willett, the "Daylight-saving" reformer, to the non-federated London Masters to join him in a lock-out to-morrow week, unless a settlement is arrived at before then. Our own present opinion is that no general lock-out should be attempted without the sanction of the National Federation of Building Industries, and that the non-federated masters will do well to hold their hands till that is given. With some of the fabrications just above referred to the Secretary of the London Master Builders' Association deals effectively on another page.

The monumental muddle of the Income-tax does not only affect the Bank of England, the other banks, and the City all round financially, but it also touches up every man of business. For in payment of ground rents, rack rents, and mortgage interest there is going to be a deal of bother about the right amount to deduct. With regard to half-yearly ground rents, due June, one quarter will be at 1s. 2d., and one at 1s. 3d.; so the best way out seems to be to take 1s. 2½d. for the whole half-year. In reference to mortgage interest, where the half-yearly dates must often fall awkwardly, there will have to be complicated calculations, resulting, if worked out exactly, in decimal

fractions that will end in some short compromise. But this is by no means all. For the Bank of England and others will doubtless deduct the full 1s. 4d. from dividends on stocks generally, as this is the only legal figure, leaving the people to get back what they can from Somerset House, where they stand to make a good deal of money on the many small sums that will not be worth the trouble of claiming. All this confusion arises under the Greater Budget because our Chancellor forgot that the landless Radical millionaires, who have made fortunes out of coal-tar and its by-products, would not have their invested incomes cut into just as if they were only dukes or landed proprietors. And this is the Chancellor chosen by a nation of shopkeepers supported by a businesslike people!

Builders, merchants, and contractors are much interested in the legal meaning of the words "extraordinary traffic," as used in the Highways and Locomotives Act, 1878, which have lately been up for construction in the Courts. For if the passage of locomotives and traction engines with trucks of bricks, stone, and the like, upon a road be held to amount to extraordinary traffic, then the persons causing this traffic can be made liable to the local authorities for large sums in the way of repairs for damage done. The difficulty is to decide when and where traffic of this kind becomes "extraordinary." Thus in a recent case (May 11) the owner of a heavy traction engine dragging trucks loaded with stone from a quarry was held not to be liable for the £1,233 claimed for extra repairs because the road used was adapted to such traffic, and also because the quarrying and haulage of stone was a recognised local industry. But in a later case (May 21) the Court of Appeal declined to decide whether the fact as to the road being, or not being, adapted to heavy traffic was conclusive, as the authorities were conflicting, and each case must depend on its own merits! Here the heavy traffic had been taken down a country lane, because of the tramway on the high road. Of course, the use of traction engines on such a road was in itself extraordinary, and the Court held the parties so doing liable for all costs of repair beyond that caused by the ordinary traffic, and declined to accept the excuse that this lane was the only alternative road for use if the main highway was not available.

Some of the daily papers, as usual, commenting on building developments between Highgate and Hampstead have gone tooth and nail for the Ecclesiastical Commissioners and other adjacent landlords, and prophesied the speedy covering of all the vacant ground which still isolates the two pleasant Northern suburbs from the rapidly-filling regions beyond. They are really prematurely pessimistic. Mr. S. E. Downing protests that the Commissioners have no such proposal under their consideration, nor any scheme for the development of the estates that has not already been pursued for many years. One writer talks about three roads piercing the Commissioners' estate, but really the one which may properly be described is Bishop's Avenue, and that road was constructed by the Commissioners twenty-five years ago, and building development along this road, which traverses the Bishop's Wood, has been very slow, mainly, if not wholly, because the Commissioners have insisted upon a standard of house and

grounds which makes it possible to preserve, in some degree, the sylvan character of the place, and prevents wholesale or unnecessary destruction of the wood. The lease of the two golf courses have still some years to run, and nobody yet knows that the lands are "to pass into the hands of the builders" when these leases come to an end. The Commissioners are, of course, reasonably developing their estate; but they are better landlords than most, and it is only fair to remember that they have made substantial sacrifices to the preservation of open spaces in this neighbourhood; and the Highgate Wood (between the Great Northern Railway and the Muswell Hill-road), now under the control of the Corporation of the City of London, were the gifts of the Ecclesiastical Commissioners to the public in 1886.

The *Engineering Record*, discussing the complex duties of the practice of architecture to-day, says: "Before passing hasty judgement upon the architect of our times, think a moment of the evil days upon which he has fallen. In the Medieval times he must perforce know only the technique of masonry—the rest was his art. If he were building a church the fine stimulus of the Gothic was his inspiration, and his medium was craftsmanship in stone. To-day he must know masonry and concrete, structural steel, and sanitary plumbing, lighting and heating, electric wiring and acoustics. His predecessor did not have to plan for buying his stone from one source; his steel from another, and his woodwork from a third; he was not hounded by agents of patented devices, nor hindered by circulars of supplies offering him the usual architect's commission of — per cent." All these things the architect of to-day has to endure, besides being called a slavish copyist if he turns to the best in antiquity, and a commonplace innovator if he does not. His chief hope is in suiting himself as best he may to new conditions, calling in technical advisers on the details which he cannot in the nature of things have time to master, even if he has the ability, standing the more firmly by the interests of his client as he confronts a regiment of sub-contractors, and remembering that he must be artist before being engineer or contractor. Originality and resourcefulness are much more difficult to find than technical or constructional skill, and if the architect is to be more than a master mason or boss concrete mixer, it must be by the possession of these attributes. Art did not die with the Gothic nor perish with the Romanesque. The times have changed, and the architect must change with them."

Liverpool, like other large cities, is beginning to wonder what it will do with its statuary. The plateau in front of St. George's Hall and St. John's Gardens are quite filled with examples of art in stone, and now the Pierhead is suggested as the site of the memorial to King Edward. One correspondent suggests that statues are no longer of value when the generation which knew the men in whose memory they were raised have passed away, and that a good way out of the difficulty would be to remove the obsolete statues to the outskirts. Another thinks they might be re-moulded up from time to time and utilised for the temporary glorification of newer celebrities, as in some of the waxwork shows.

Building Intelligence.

BISHOP'S STORTFORD.—A Territorials' drill-hall has been erected in Old-road, and was opened on Wednesday week. It is of timber, on concrete foundations, with corrugated iron roof and match-lined interior and its total cost, with the purchase of the land, exceeded £1,200. It contains a drill-hall 60ft. by 30ft.; an indoor rifle-range 100ft. by 12ft. 6in.; armoury, 18ft. 6in. by 14ft., fitted with rifle and clothing racks; armourer's bench and cubboards; orderly room, 14ft. by 16ft.; and men's room, 17ft. 6in. by 18ft.; offices, boiler-house, etc. Its construction has been carried out by Messrs. H. Rooke and Sons, of Cambridge.

ROSEBERY AVENUE.—At the meeting of the Metropolitan Water Board on Friday it was decided that Mr. H. Austen Hall, F.R.I.B.A., whose design for the new central offices to be built in Rosebery-avenue, was accepted by the Board a month ago, on the recommendation of the assessor, Mr. E. Guy Dawber, be appointed architect for the building. We illustrated and reviewed all the six designs submitted in this competition in our issue of June 5. The general purposes committee, in submitting this recommendation, stated that they concurred in a suggestion by Mr. Austen Hall that he should be allowed to rebuild the Oak Room, on the western side of the building, where it could be used either as a committee, members', or chairman's room. The committee added: In the original scheme Mr. Hall provided that two sides of the building should be in stone and the remainder stock brick. Mr. Hall has given further consideration to the matter, and proposes that the three sides of the building which will be seen from the existing public roadways should be in red brick with stone dressings, and they agreed to the suggestion. This alteration will not, Mr. Hall believes, affect the estimated cost of the building. In the report which accompanied his design, Mr. Hall stated that the floors of the corridors would be paved in terrazzo or black and white marble, the board room and committee rooms to have oak floors, and the floors of the offices to be finished in cement for linoleum, and wood blocks in the more public offices. The committee were of opinion that it would be more economical in the long run if the floors of all offices were finished in wood blocks, and Mr. Hall informs us that the additional cost will be about £1,800. On the other hand, if the floors were finished in cement, linoleum would have to be provided at a cost of about £900, and this would have to be renewed periodically. In the committee's opinion, the general scheme of arrangement of the offices which Mr. Hall proposes called for little or no modification. They were unable to suggest any possibility of reducing the estimated cost of the building. The committee's recommendations were adopted, and it was further decided to appoint Mr. Hugh Watkins, of Gray's Inn square as quantity surveyor at a fee of 1½ per cent. on the cost of the building, estimated at £91,059, or £100,000, with architect's fees at 5 per cent., and allowances for contingencies.

Mr. H. W. A. Carter, surveyor to the Matlock Bath Urban District Council, has been appointed town surveyor of Bollington, Cheshire.

Mr. H. L. Bottomley, Brighouse, has been appointed surveyor to the Healden Bridge Urban District Council. There were 61 applicants.

The Dublin Corporation have increased the salary of Mr. P. J. Monks, the manager of the municipal workshops, by £100 per annum.

Albert John Dobb, 31, a plasterer, found guilty, at the Old Bailey, of the murder of his two-year-old daughter at Wimbledon, has been declared insane, and ordered to be detained during the King's pleasure. He had been out of work in consequence of the builders' strike, and this had preyed on his mind.

The corporation of Manchester advertises its intention to apply to the Local Government Board for authority to prepare a town-planning scheme for a large area in the south of the city, thus advancing a little further a scheme which has long been under consideration. The preliminary Local Government Board inquiry will be held in August.

PROFESSIONAL AND TRADE SOCIETIES.

BRITISH MASTER BUILDERS' ASSOCIATION.—The annual excursion of this association was held on Thursday in last week, when about eighty members took part in a motor excursion over the Cotswolds. Among the company were Messrs. F. A. R. Woodward (president) and A. J. Pitt (secretary), G. H. Oatley (president Bristol Architects' Society), C. F. W. Dening (hon. secretary Bristol Architects' Society), Councillor T. Sturge Cotterell (Bath), E. W. Wooster (Bath), Councillor H. F. Cotterell, Councillor A. Dowling, Councillor E. L. Neale (hon. treasurer), and W. H. Taylor (Clerks of Works and Builders' Foremen's Association). Leaving the guildhall, Small-street, at nine o'clock a.m., four torpedo char-a-banes conveyed the party by way of the eastern end of the city to Wotton-under-Edge, Nailsworth, Stroud, Painswick, Cranham Woods, to Birdlip. The first halt was made at Painswick, where the fine church was inspected, and lunch was partaken of at an hotel at Birdlip, from which high-lying village, amid almost unrivalled scenery, the motors proceeded to Cirencester and Bibury. Here for a while the cars were left, and members strolled through the streets of the village, at first visiting the well-kept churchyard and entering the splendidly preserved church, which has Saxon work in its doorways, and has Norman arches. Through the village runs, in placid beauty, the River Coln, a stream which passes through the grounds of Bibury Court, a mansion containing Tudor, Elizabethan, and Jacobean architecture. Its interior is notable for the possession of a fine carved staircase. The greater part of the house was built in 1623 by Sir Thomas Sackville, and was recently purchased by the present owner, Lord Sherborne. The position of the mansion, its exquisite gables and grouping of chimneys, and its surrounding grounds and woods, could not be surpassed. From Bibury the party progressed to Fairfield, where the glories of the stained glass in the parish church were concisely explained by the vicar. The church was built between 1486 and 1497 by one Tame, a wool merchant, and the wonderful stained glass represents—in the west window, the Last Judgment; in the body of the church, the History of the Faith; and in the eastern portion, the Gospel Stories. Visits to the churches of Tetbury and Chipping Sodbury concluded a day of great interest.

LONDON ARCHÆOLOGISTS AT COLCHESTER.—The members of the London and Middlesex Archæological Society visited Colchester on Saturday, when they inspected the Roman and other relics of antiquarian interest under the direction of Dr. Henry Laver. After a municipal welcome at the town hall, the members proceeded to the castle, which has a Norman keep larger than that of the Tower of London. Dr. Laver narrated the history of the castle and of its narrow escape from the hands of John Weeley, the Colchester vandal. He then conducted the members to the crypt, which is now used as a museum, and contains the finest collection of Roman remains in existence. After leaving the castle the members inspected St. Botolph's Priory, the ruins of the first establishment of the Augustinian canons in this country; the gateway of St. John's Abbey; the last abbot of which, John Beche by name, was hanged for opposing the wishes of Henry VIII.; Tymperley's, the birthplace and residence of William Gilbert, physician to Queen Elizabeth and James I. and the father of electrical science; Holy Trinity Church, remarkable for its Saxon tower, in which Roman bricks are used; and the Balkeine Gate, the western entrance to the Roman city.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.—The Board of Architectural Education announce that the designs submitted by the following students who are qualifying for the final examination have been approved:—Subject XIV. (a).—Design for Council Offices: Messrs. G. Allen, W. Allison, J. R. Armstrong, J. Blackford, C. J. Brooks, J. M. Brown, W. Allison, C. Ap-Griffyd, H. Battiscombe, R. Bowes,

T. H. Broomhall, C. W. Callender, L. E. Carreras, H. F. Davies, V. Dyson, T. C. Evans, C. A. Foote, L. S. Ford, A. L. Frazier, B. George, H. F. Gosling, H. Gregory, W. Griffiths, A. B. Hamilton, G. L. Head, J. D. Hossack, J. H. Jacob, C. H. James, H. N. Jepson, L. F. Jones, H. Z. Kassem, G. A. Langdell, E. C. Lavender, G. S. Leadam, S. H. Loweth, A. L. Macmillan, R. S. Moore, W. N. Moscrop, C. L. Pace, N. S. Robinson, C. Rowntree, G. Shennstone, P. N. Stedham, K. Takekoshi, W. E. W. Terrell, H. S. Triscott, H. F. Walker, P. G. White, J. F. Wilson, W. C. Young, H. L. Charles, R. A. Duncan, G. M. Eaton, S. Fernyhough, A. S. Forbes, R. Frater, S. G. Garrett, F. E. Gooder, G. H. Gray, C. Grellier, H. V. Hague, E. J. Hart, G. Hemm, G. B. Howcroft, R. Jackson, T. T. Jenkins, A. G. Johnson, W. O. Jones, M. D. N. Koch, F. C. Langrish-Toye, W. V. Lawton, H. A. Lister, D. R. Lyne, J. B. Matthews, A. L. Mortimer, D. G. Mowat, W. F. Pennington, G. A. Rose, C. D. St. Leger, G. P. Stainsby, A. E. Stott, J. A. C. Taylor, L. D. Tomlinson, J. B. M. Walsh, N. B. Weekes, H. M. Whitehead, N. F. Woodroffe. Subject XIV. (b).—Design for Church Spire: Messrs. F. A. Barley, C. W. Craske, J. Dickinson, M. Hendry, A. H. Owen, J. E. P. Toothill, C. C. Cheek, H. E. Crossland, J. S. Fyfe, K. B. Mackenzie, M. Robertson. Designs for other subjects from the following candidates have also been approved:—Messrs. W. B. Binnie, D. C. L. Derry, W. B. Gosling, I. Omar.

THE ROYAL INSTITUTE OF THE ARCHITECTS OF IRELAND.—A general meeting of the members of the above body was held at 31, South Frederick-street, Dublin, on Monday evening, June 29. The president, Mr. R. Caulfield Orpen, R.I.A., was in the chair, and there was a good attendance of members. The discussion with reference to the R.I.B.A. proposed new Charter in place of Registration by Bill, was continued, and the following resolution was passed: "In view of the recent attitude of the R.I.B.A. in relation to the proposed Charter, and the subject of representation which the proposals involve, this meeting would urge the council of the R.I.A.I. to take action in obtaining for this institute permanent and adequate representation on the Council of the R.I.B.A., and to consider the propriety of supporting the principle that every member of the R.I.B.A. should be entitled to register his vote on all questions of architectural policy, without personal attendance at the London meetings." The prize drawings of the R.I.B.A. are on view from July 1 to 10 inclusive, at the Rooms of the Architectural Association of Ireland, 15, South Frederick-lane, from 11 a.m. to 2 p.m., and from 3 p.m. to 6 p.m.

THE QUANTITY SURVEYORS' ASSOCIATION (INCORPORATED).—Mr. T. E. Bare (Messrs. Bare, Leaning, and Bare, 115, High Holborn, W.C.) has been elected president of this association for the ensuing year, and Messrs. Henry Vale, F.S.I. (Wolverhampton), and F. W. Harrison, F.S.I., vice-presidents.

A Roman Catholic church is about to be built on the site of four houses in Lorrimore-road, Walworth, from plans by Mr. F. A. Walters, F.S.A., of Westminster.

Mr. H. G. Norris, auctioneer, estate agent, and builder, of Richmond, who is now Mayor of Fulham, a position he has held for five years, has been chosen as one of the Unionist candidates for Stockport. The other Unionist candidate is Dr. Francis Fremantle, medical officer of health for the county of Hertford.

Mr. W. Collin, Local Government Board inspector, held an inquiry on Thursday night in last week into the application of the Rainford Urban District Council to borrow £2,500 for the erection of fourteen workmen's dwellings. It was stated that land for the houses had been offered for 1s. 2½d. per square yard by Earl Derby, and Mr. Baron, St. Helens, the architect who had prepared the plans, said the cottages could be erected at a cost of £150 each. Complaint was made by several property-owners that private builders could not get land from Lord Derby on the same terms as those offered to the council.

COMPETITIONS.

CANBERRA PARLIAMENT HOUSE.—The conditions governing the competition for the designs for the Parliament House in Canberra, to cost £1,000,000, have now been issued. Designs may be delivered to the High Commissioner up to March 31, 1915. Eight premiums are offered, amounting in all to £6,000, the first award being £2,000. The first competitor will be employed on the initial portion of the building, and probably also in the subsequent stages of construction.

GATESHEAD.—Members of the Society of Architects are requested not to take part in the competition for the proposed new school, King Edward-street, Gateshead, without first ascertaining from the Secretary whether the conditions have been so amended that they can be approved by the Society.

MANCHESTER.—At the meeting of the city council on Wednesday, the sanitary committee submitted for approval a proposal to build a number of semi-detached cottages on the Blackley estate, belonging to the corporation. Fifty-five designs for such cottages, sent in by twenty-six competitors, had been considered, and the committee had resolved—“That, subject to its being ascertained by the committee that the probable cost of satisfactorily carrying out the work will not exceed the authors' estimates by 10 per cent., the premiums offered in the advertisement dated April 6, 1914, for competitive plans, specifications, and estimates for semi-detached cottages on the Blackley estate be awarded to the authors of the following designs: First premium, £50, design No. 28; second premium, £25, design No. 20.”

ROME SCHOLARSHIP IN DECORATIVE PAINTING.—The Royal Commissioners for the Exhibition of 1891 have this year awarded the Rome Scholarship in Decorative Painting to Mr. John Miles Bourne Benson, on the recommendation of the Faculty of Painting of the British School at Rome. Mr. Benson is twenty-five years of age, and studied at Dulwich College and the Slade School. The other candidates chosen to compete were Miss G. D. Davison, Mr. T. Derriek, and Mr. S. Woods-Hill. The scholarship is of the value of £200 per annum, and tenable at the British School at Rome for three years. For this competition this year the Faculty selected “The Judgement of Paris” as the subject to be executed in oil or tempera on a panel measuring 7ft. by 5ft. A cartoon done for the decoration had also to be submitted. The Faculty of the British School at Rome, who conduct the competition for the Scholarship in Painting, consists of Mr. George Clausen, Mr. A. S. Cope, Sir Charles Holroyd, Mr. Dermot O'Brien, Sir Edward Poynter (chairman), Sir William Richmond, Mr. Charles Ricketts, Mr. J. S. Sargent, Mr. Charles Sims, Mr. P. Wilson Steer, and Mr. Henry Tonks. The work done in the final competitions in each section will be exhibited at Crosby Hall during the week beginning on Monday next, July 6.

A Select Committee of the House of Commons sanctioned on Wednesday a provisional order under which the Corporation of Deal seek power to construct a pier and marine pavilion at an estimated cost of £8,600.

The Ilkley Town Hall buildings have now been completed by the erection of a winter garden on the west, connected with the King's Hall, which was formally opened last week. The architect of the winter garden is Mr. Henry West, building inspector under the council, and outwardly it is in harmony with the rest of the town-hall. The length of the new portion is 117ft., and the width varies from 53ft. in front to 35ft.

The following appointments by Boards of Faculties have been approved by the General Board of the Faculties and by Convocation of Oxford University:—Guy Dickens, M.A., Fellow of St. John's College, as University Lecturer in Classical Archaeology, in succession to L. R. Farnell, M.A., D.Litt., Rector of Exeter College; John G. C. Anderson, M.A., student of Christ Church, as University Lecturer in Roman Epigraphy; and E. A. Loew, Ph.D. Munich, as University Lecturer in Palæography. The examiners for the Diploma in Classical Archaeology have awarded the Diploma to Stephen A. Wadsworth, B.A., Magdalen College.

Correspondence.

THE LONDON BUILDING TRADE DISPUTE.

To the Editor of the BUILDING NEWS.

SIR,—Certain interested parties seem to have given free rein to their imagination in disseminating, through the Labour Press, detailed descriptions of disputes and antagonisms within the ranks of the London Master Builders' Association.

These statements have hitherto been ignored; but, lest the public, or the workmen in particular, should be misled or deceived, I beg to claim your indulgence to state that all such representations are not only inaccurate, but, I fear, wilfully so, and there is no foundation whatever for such malicious reports.

Both at the meetings of the Council and at the general meetings of this Association, all decisions have been practically unanimous, and there has been no conflict or antagonism whatever—in fact, it is difficult to imagine how any dissensions could arise on the particular points at issue.

Much misconception also apparently exists as to the attitude of the London Master Builders' Association towards trade unionism. It has been represented that the L.M.B.A. desires to secure the advantage of employing non-unionists at lower wages than trade unionists, and that for this, or some other reason, favour or preference is shown to non-unionists, and endeavours are made to check the propagation of trade unionism, which is resented by the trade unions.

In order to remove any such erroneous ideas, a statement of the principles which guide the L.M.B.A. on this subject may be of service at the present juncture.

The L.M.B.A. offers no objection to the fair and peaceful propagation of trade unionism—that is to say, that the unionist workman should be quite at liberty to impress upon his fellow-workmen his arguments and views on trade unionism (and, vice versa, the non-unionist should be at liberty to do the same), provided, of course, that such discussions do not interfere with the progress of work.

The L.M.B.A. objects only to coercion and persecution being exercised on either side, and cannot consent to any of their workmen being driven from employment, or maltreated, because of the attitude they may see fit to adopt on the question of trade unionism.

The L.M.B.A. shows neither favour nor prejudice on either side; both are equally eligible for employment; both are paid the same rate of wages, and work under the same terms and conditions as to hours of labour, overtime, etc.

If, by fair and reasonable argument, the trade unionists can convert all non-unionists to their views, and by such means the non-unionists were eliminated, the L.M.B.A. would accept the situation with equanimity. They stand for “fair play and no favour,” and any representations to the contrary are both unjustifiable and incorrect.—Faithfully yours,
S. B. DEPREE, Secretary.

London Master Builders' Association,
Koh-i-Noor House, Kingsway, W.C.

THE ARCHITECTURAL STAFF OF H.M. OFFICE OF WORKS—THE REPORT OF THE HOLMES COMMITTEE.

SIR,—The recommendations of this committee show all the way through a tinkering with the organisation, such as the reduction of the architectural staff by a branch, and the change from one principal architect to three. There is no real grasp of vital principles, except perhaps the recommendation that the whole of the staff of the Office of Works should be brought together into one building, and to have come to this conclusion should not have required the combined wit of the Chairman of the Board of Works, Dublin, with a salary of £1,500, the Assistant Secretary of the Office of Works, London, with a salary of £1,100 and a first-class clerk

in the Treasury. One recommendation stamps the remainder of the report at its true value—a concoction by an engineer and two laymen bent on cutting down expenses at all costs. It is worth quoting in full.

“Architectural Assistants, Draughtsmen, and Technical Assistants.—All members of these classes, including those engaged upon purely technical work other than drawing, to be brought together, as soon as conditions of accommodation permit, into one central drawing office in charge of a first-class assistant architect and surveyor assisted by qualified architectural assistants.” (Page 29, xviii.)

“With the principle laid down when the scheme was introduced—viz., that in future the Drawing Office should as a rule be manned by young men temporarily serving in the office and discharged at the age of 30, we are in general agreement, though we doubt whether that age is not too advanced.” (Page 19, para. 79.)

So it is proposed that a gentleman with a salary of from £350 to £450 shall be the real principal architect for half a million worth of new work yearly, while there will be three Office of Works principal architects with salaries from £800 to £1,000, and nine architects at salaries from £550 to £750. Whether the designing of new works is to be divorced from the supervision of them is not clearly stated. If it is not, the only work left for the architects will be that of maintenance surveyors in charge of painting, whitewashing, chimney sweeping, and window-cleaning. If it is, the result will be chaos.

One can imagine our foreign visitors being taken, as one of the sights of London, into a magnificent hall some 250ft. by 50ft., to see official architecture being “turned out.” Another step forward to the Ministry of Fine Arts! The process will be somewhat as follows:—The “principal architect” with the salary of £350 to £450 will every morning call on the heads, for the future misnamed architects, of the different branches for orders. Orders by post and telephone will also be promptly attended to. Amid the din and confusion of that vast hall he will then proceed to allocate the work; the plan of a Labour Exchange will be given to a young man of twenty-three, the elevation of a Government office to the neo-Greek expert of twenty-seven, while a new consulate at Timbuctoo will be given to the junior of eighteen years, as the professional papers will not be able to criticise that work of art.

But what understanding of architecture can one expect from an engineer, however eminent, and two lay officials? Point is given, by the memoranda at the end of the report, to this lack of understanding due to the composition of the committee. Where the engineer, as a technical man, really makes a good suggestion—that the technical side should be represented on the board—the two lay officials, with the conceit of their class, unite to crush it; for to their minds a lay board is perfectly capable of appreciating technical differences and of settling difficult technical problems. So with architecture; only here, of course, the lack of understanding is trebly intensified. Later, after another eminent engineer has sat in committee, it will be found more economical to have sheets of stock features from which elevations may be set up mechanically after the different types have been specified by number.

The whole report is wordy and indefinite, and not always grammatical. The employment of the private practitioner on new works is to be decided by the circumstances in each case, the circumstances being the nature and position of the building, the talent at the disposal of the office, and the amount of work in hand. There is, therefore, small hope for the private practitioner. By the time Government officials have acquired enough modesty to decide that they have not sufficient talent, the present generation, at any rate, will have passed away. It is something that it is recognised that it requires talent to design buildings. Who does the designs does not appear. As “the design and supervision of new buildings . . . occupies (sic) a comparatively subordinate place in the work of the Board's

architects" (para. 26) and the assistant architects (paras. 54-61) and technical assistants (para. 70) are not mentioned as performing either of these important functions, while the duties of draughtsmen "are confined to drawing, though some prepare specifications and a few are employed now and then to make minor surveys," it is difficult to see how the architectural work of the office is done. Perhaps, as with the man in the street, the committee (one engineer and two laymen) view an architect's principal work as "drawing."

The present discontent of the temporary staff is admitted and minimised. The cause of it is said to be the fact that the established and unestablished officials in many cases perform the same duties, and the remedy recommended is an increase of twenty-seven posts in the established architectural assistant class. Seeing that this class was only created nine months before the date of the report, and even less time before the investigation of the committee, it may be safely affirmed that the discontent, which, as the report says, "has been serious in the past," does not arise from the fact that the temporary staff perform the same duties as the established architectural assistants. The remedy proposed is therefore no remedy, but only a palliation, or rather a soporific, for once in that class all hope of further promotion has gone. One cause of the discontent is probably the opinion of their status held by the lay governing officials of the office, as illustrated by the travestied account of draughtsmen's duties quoted above. There is an ominous resemblance between the name of this report and another now famous one: Holmes, Holt; Holt, Holmes. As Mr. Ramsay MacDonald said with reference to the other, "It was against the best interests of the country to allow grievances to accumulate until strikes were threatened or until agitation became hot and furious, and unreasonable pressure was exerted." (The Times, June 11, 1914). It would seem as if the Holmes Committee, by their recommendation of a central drawing office, were bent on affording every facility for such courses.—I am, etc., A.R.I.B.A.

WATER SUPPLY AND SANITARY MATTERS.

METROPOLITAN WATER BOARD.—At the meeting on Friday of the Metropolitan Water Board, the Works and Stores Committee reported that tenders would shortly be adjudicated upon for the construction of reservoirs Nos. 6 and 7 at Littleton, and that the chief engineer informed them that it would be necessary to proceed with the following additional works, which will be necessary on or before the completion of the first of the two storage reservoirs, viz.: (a) New pumping main from Kempton to the Horsenden Hill reservoir, with trunk mains to Ealing, Will-shen, Cricklewood, and beyond; (b) new filter-beds at Kempton; (c) all pumping machinery and buildings to contain same; (d) covered service reservoir at Horsenden Hill; and (e) conduit from the Littleton reservoirs to Kempton and Hampton. They recommended that tenders be obtained for carrying out these supplementary, the expenditure upon which is estimated at £806,900, in addition to the anticipated outlay on the two reservoirs at Littleton. These recommendations were adopted. It was reported to the Board that the contract for the engine-houses at Walton on Thames had been completed by Messrs. Dick, Kerr, and Co., Ltd., at a total cost of £77,916 10s. 11d. The Works and Stores Committee further reported, and with regret, that Mr. Sidney Marsland, assistant district engineer, Kent district, who would complete thirty years' service on August 5 next, and had proved a valuable officer to the Kent Waterworks Company and to the Board, was retiring owing to ill-health.

The Devon County Council have appointed Mr. R. M. Stone, of Wells, as county surveyor for the Barnstaple division.

Lord Sydenham opened at Haileybury College on Thursday in last week the new Big School, the foundation-stone of which was laid two years ago by Princess Henry of Battenberg. The additions have been made from plans by Mr. John W. Simpson and Mr. Maxwell Ayrton, and were illustrated in our issues of August 23, 1912 and October 24, 1913.

LEGAL INTELLIGENCE.

IMPORTANT FINANCE ACT APPEAL.—(Walter Morrison, Esq., v. Commissioners of Inland Revenue: Re Pen-y-Ghent Farm, Malham, Yorks).—This case raised important questions as to whether, in arriving at the full site value of agricultural and moorland properties, the land should be deemed to be divested of, inter alia: (a) the grass and heather growing thereon; (b) the stone walls used for the purposes of shelter, as well as for the purposes of boundaries and division; and (c) whether the value for agricultural purposes should include the value of the sporting rights. In the Award, printed below, the referee has decided: (1) That the farm should be treated as divested of grass, heather, and everything growing thereon, and he reduces the official full site value from £7,110 to £1,200; (2) that the land should not be considered as divested of the stone walls (which are about eleven miles in extent); and (3) that the value of the sporting rights should not be included in the value for agricultural purposes. The ultimate result of the Award is that the official assessable site value of the farm is reduced from £6,850 to £940.

DECISION OF REFEREE.

The decision on the appeal in respect of which the annexed notice of appeal has been given is as follows:

1. The item 1 in the provisional valuation (gross value) should be £7,660 instead of £8,060.
2. The total value should be £7,400 instead of £7,800.
3. The items 2 and 12 are insufficient, and should respectively be £6,460 instead of £950.

In arriving at this amount of £6,460 I have included in it (a) the grass and heather and all things growing on the farm, and (b) the farmhouse and farm-buildings, together with the walls enclosing the garden and fold-yard used in connection with the farmhouse and farm-buildings respectively, and also the outlying buildings on the farm, consisting of a shooting-but and a lambing-shed, and a barn and cowshed on the part of the farm called Blishmire; but I have not included the dry stone walls which form the boundary fences of the farm, and the division fences between the various enclosures of the farm. If these walls ought to have been included, the above amount of £6,460 would have been increased by £700. The various buildings and structures referred to by me, or typical parts thereof, are shown on the two sets of photographs signed by me as exhibits at the request of the parties to the appeal as follows—viz.:

- (a) Seven photographs marked "W. M." put in before me on behalf of the appellant;
 - (b) Nine photographs marked "I. R." put in before me on behalf of the respondents.
- The farm is described on the Ordnance map signed by me, and is thereon shown by being coloured round with red.
4. The full site value should be £1,200 instead of £7,110.
 5. The deduction for tithe-rent charge should be £260.
 6. The assessable site value should be £940 instead of £6,850.
 7. The value of the sporting rights is £2,100.
 8. The value of land for agricultural purposes should be £5,300 instead of £5,700.
- Dated this 19th day of June, 1914.

J. M. CLARK.

BUILDER SUED BY BOARD OF TRADE.—(Insurance Deducted: No Cards Stamped).—An Insurance Act case in which the Board of Trade were the plaintiffs was heard at Worthing County-court on Monday. Mr. Pinker, a local builder, was sued for 19s. 2d., contributions paid under the Act. The solicitor who appeared for the Board of Trade said the money was due from the defendant in respect of unemployment insurance. Practically half the amount was deducted by the defendant from the weekly wages of his workmen; but he did not put the stamps on their cards, and had benefited by half the sum mentioned. Two witnesses who gave evidence said they had been employed by the defendant, and had had to complain to the Board of Trade. It was said that the money had been paid into court during the morning, and the judge gave costs against the defendant on the higher scale, holding that the case was one of public interest.

DAMAGES FOR BREACH OF CONTRACT.—In the Manchester County-court on Monday, before his honour Judge Mellor, K.C., Messrs. William Moss and Sons, Ltd., contractors, of Queen's road, Loughborough, sued Messrs. E. Cheve Porteous Ltd., manufacturers, of Market-street, Manchester for £17 5s. as damages for breach of contract. Sir W. Cobbett was solicitor for the plaintiffs, and Mr. Merriman

counsel for the defendants. The plaintiffs' case was that in connection with a contract they had to erect a county asylum at Stannington, Northumberland, at a cost of £80,000. The defendants sub-contracted to supply a quantity of steel strips used for protecting pipes. As they would not be required until the pipes were laid and tested, the date of delivery was postponed, and when a request was sent for them Messrs. Porteous declined to supply them except at current prices, which were higher than at the date of the sub-contract. The defence raised was that the request was so different from the original contract as to constitute a variation of it. Originally, the strips were to be in four widths, whilst the request was for the strips to be cut into eleven different widths. This necessitated additional cost in both material and labour. Mr. Merriman also submitted that, in any event, the rise in prices was only small, and that the claim had been exaggerated. Whilst the defendants were to supply the goods at £13 15s., the plaintiffs actually paid £31 in buying against them.—Judge Mellor, K.C., held that in accepting the lowest price they could get the plaintiffs had done all that could be expected of them, and gave judgment for the amount claimed, and costs.

RESTITUTION SUIT BY ARCHITECT'S WIFE.—In the London Divorce Court on Friday the Hon. Mrs. Eleanor Charlotte Wade Palmer, grand-daughter of the twenty-fourth Baron de Ros of Standford, Co. Down, was granted decree of restitution of conjugal rights against her husband, Mr. Aubrey Nugent Wade Palmer, architect. The suit was undefended. Counsel stated the parties were married eight years ago, there being two children. Last February the husband wrote saying it was impossible to live together again. His wife asked him to return, but he refused.

PARLIAMENTARY NOTES.

LAND VALUATION DEPARTMENT.—On the taking of the vote on Tuesday, of £1,287,320, for the Inland Revenue Department, Earl Winterton asked for an explanation of the increase of £170,000 in respect of the expenses of the Land Valuation Department. He wanted to know on what principle the junior valuers were selected. Mr. Lloyd George said the valuers were now entering on the valuation of hereditaments which were a considerable distance from the central office, and therefore their travelling expenses had naturally increased. He did not think that £11,000 was a very large sum for the cost of appeals, considering that 8,000,000 hereditaments had already been valued. As to the duties of the valuers, he agreed that the valuation of the land of the country was a difficult operation, which required the services of men of skill and experience. The junior valuers did a great deal of reference and clerical work. They had to pass the examination of the Surveyors' Institution or of the Auctioneers' and Estate Agents' Institute. As to the qualifications of valuers, a first-class valuer must be a Fellow of the Surveyors' Institution, and a second-class valuer was normally required to be an Associate of the Surveyors' Institution.—Mr. Royds complained that the Chancellor of the Exchequer had never stated plainly whether drainage reclamations and other similar improvements were to be included in site value. The House was left in ignorance, and the public had to fight costly legal contests to ascertain the law. Another question upon which he desired information was as to the effect which this Valuation Department had had upon estate duty.—Replying to Mr. Rupert Gwynne, Mr. Montagu (Secretary to the Treasury) said it was proposed that all clerks to surveyors of taxes should be put on a permanent and pensionable establishment. It was proposed to discontinue entirely the employment of boy labour, and the existing boy clerks would be absorbed into the new organisation. They also proposed to re-classify the staff on improved scales of pay, and to make further concessions in the matter of counting unestablished service towards superannuation. These things would mean an improvement of something like 60 per cent. on the present conditions of remuneration and pensions combined, and would begin from last April 1. In the end the Vote was agreed to.

The Manchester City Council decided on Wednesday to expend £21,000 on extensions at the Municipal School of Technology.

The town council of Ipswich have adopted a scheme for building workmen's houses at a cost of £1,400, and the public health committee have been authorised to carry out the proposals. The town council have accepted the gift of a site in Northgate-street for the proposed central library.

Our Office Table.

The Local Government Board have given authority for the preparation of five further town-planning schemes under the Housing and Town-Planning Act, 1909. The schemes are authorised to be prepared by the corporations of Huddersfield and Tynemouth and the urban district council of Barnet. In the case of Huddersfield three schemes are authorised to be prepared relating to areas of 1,071, 913, and 310 acres situate within the borough. In that of Tynemouth the scheme is to extend to an area of 945 acres situated partly in the borough and partly in the urban district of Whitley and Monkseaton. In the application on behalf of Barnet the scheme is to apply to an area of 2,213 acres in the urban district.

The office of land steward and surveyor to the corporation of Liverpool, vacant by the retirement of Mr. Shelmerdine, has been, subject to ratification by the city council, filled by the selection of Mr. Albert Jenkins, at present estate agent and valuer to the corporation of Swansea. For this important post, which carries a commencing salary of £1,200 a year, there were some forty applications. These were dealt with by a sub-committee, who reduced the list to three—namely, Mr. Jenkins and two local applicants. Mr. Jenkins is forty-two years of age, and is a fellow of the Surveyors' Institution, a member of the Auctioneers' and Estate Agents' Institution, and of the Royal Sanitary Institution. Formerly in private practice in Swansea, he has had considerable experience of estate development, building, and management, and has had charge of large transactions in all classes of property, ranging in value from £100 to over £10,000. For the past three years he has managed the Swansea Corporation buildings and landed estate, the latter comprising over 1,000 acres, with a rental of about £18,000 a year, besides 645 acres belonging to the education committee. He has advised the corporation in respect to a development scheme for the Town Hill estate, eventually to cost over £300,000, plus a tramway scheme to cost about £50,000, and various housing and drainage projects. Mr. Jenkins is also consulting surveyor to the King Edward VII. Welsh National Memorial, and surveyor to the joint committee of the Swansea and Merthyr Tydfil Asylum and other public institutions. He designed the first open-air school in Wales.

At the last meeting of the Middlesex County Council, the Highways Committee, reporting upon the question of the remuneration of the county engineer and surveyor, pointed out that in connection with the Great West road a large amount of extra work had already been thrown upon that official, and in the event of the Bill now before Parliament becoming law, a great deal of additional work would be cast upon him in connection with the construction of the road, acquisition of property, and other matters incidental to the work. Mr. W. T. Wakelam was appointed in 1898 at a salary of £700, rising to £850, by annual increments of £25. In 1900 and 1902 there were further increases, and the amount of Mr. Wakelam's salary was £1,400. The committee recommended that this should be increased to £1,600, rising by £50 to a maximum of £1,800. The consideration of this matter was referred to the Council sitting in committee after strong protests had been made against the exclusion of the Press and the public. On a vote being taken, 27 voted for and 19 against the exclusion. The committee's recommendation was adopted.

At the same meeting it was decided, after much discussion, by a large majority to sell to Olympia, Limited, West Kensington Gardens, Hammersmith, for £23,000 for the benefit of the Latymer Foundation at Edmonton. The property comprises fifteen houses, and is part of the estate of the Foundation vested in the Middlesex County Council as trustees under the scheme of the Board of Education. The ground rent, which falls in in 1953, amounts to £153 per annum. The Highways Committee reported that in connection with the proposed improvement of Richmond Bridge, they had conferred with

representatives of the Surrey County Council, and as a result it was considered possible to devise a scheme at a moderate cost to widen the bridge and improve the approach on the Surrey side, whilst retaining the artistic beauty of the structure. As a preliminary it will be necessary to put down test pits for the purpose of closely inspecting the foundations of the bridge. This will cost £700, each county authority contributing one-half. The recommendation was carried.

The question of the respective merits of the reciprocating and turbine types of motor fire-pump has caused considerable controversy at Preston, where for some time past the town council has had under consideration the question of purchasing two motor fire engines. Numerous tests have been witnessed with each type of pump, and in the case of the turbine design an outside expert reported on the trials. The matter was finally settled at the council meeting on Thursday last, when it was decided to order two "Hatfield" motor fire-engines, fitted with reciprocating pumps, from Messrs. Merryweather and Sons, of London. The chairman of the streets and buildings committee said that the reciprocating principle in the Merryweather machine gave it a decided preference in the committee's view, and later inquiries, inspections, and demonstrations had confirmed that view. They had not gone for the cheapest machine in price, for the best would prove the cheapest. The new engines will be capable of pumping 450—500 gallons per minute, and will each carry a 60ft. fire-escape and a chemical cylinder for throwing a "first-aid" jet. Of the Lancashire brigades possessing motor fire-engines, the majority have machines of the "Hatfield" design.

Bulletin 71 of the University of Illinois is a valuable record covering 240 pages of tests of bond between concrete and iron, conducted by Mr. Duff A. Abrams. There are 86 illustrations. The issued price is one dollar, and it can be obtained in this country of Messrs. Chapman and Hall, Henrietta-street, Covent Garden. The tests described, it is claimed, have thrown considerable light on the value of bond resistance and the distribution of bond stress for a wide range of conditions in both beam and pull-out tests. It may not be expected that all of the results indicated can be applied without modification to members in which the conditions of stress differ widely from those present in the tests. Most of the discussions and conclusions are based on comparisons involving the load-slip relations. In a few of the tests the bond stress was determined from a study of the variations in the tensile stress in the reinforcing bar. The latter method furnishes a much more direct means of measuring the bond stress, but it has been available only since the recent development of a non-fixed extensometer. Additional tests are planned which are expected to give further information.

Disintegration of concrete and corrosion of reinforcing metal were the subjects of a report of the masonry committee of the American Railway Engineering Association presented at the recent annual meeting. Four conclusions, detailed in the report, are as follows:—(1) That concrete exposed to the action of sea or alkali waters or gases containing sulphur, or in which reinforcing metal is embedded, should be dense and rich in Portland cement, and should be allowed to harden under favourable conditions; (2) that concrete in contact with alkali waters should be made with aggregates inert to the alkalies in the water; (3) that cinders should not be used for concrete in which reinforcing metal is embedded; and (4) that reinforcing metal should not be painted, but should be thoroughly covered and protected with concrete when in place.

In order to preserve buildings which have not originally been properly damp-proofed, a method of insulating them against dampness has been devised by a German engineer. It consists in sawing a slot in the foundation wall just above the ground line and introducing in the slot asphalt-coated lead plates. A special machine has been designed to saw the masonry, producing a kerf

about one inch wide. As the work is done progressively, the plates being introduced as the sawing proceeds, the stability of the building is not endangered. However, to prevent any possible accident, conical iron cramps are introduced in the saw kerf. After the introduction of the insulating plates the slots are closed with temporary wooden forms, and then they are grouted with liquid cement, which completely fills them and any gaps still left open. The cement adds to the insulation, and the wall is thus thoroughly protected against creeping of moisture from the ground upward. To dry out the walls over the insulating plates, a special stove is provided.

There has been invented by a Philadelphia, Pa., mechanic a machine to clean used brick that will cut the cost to half, or even a third, of that of the old-style method of cleaning by hand. The method of operation is to put the brick into the jaws in the front of the machine, which grasp it and move it sideways over the corrugated surface. This cleans the end of the brick, and at the same time the two broad sides at top and bottom are cleaned for about two inches, back of the end. The partially cleaned sides are then inserted between two projecting opposed blades of a four-sided die, and a plunger at the other end of the brick comes forward and pushes the brick through. The upper plate of the die is movable and adjusts itself automatically to the thickness of the brick. The sides, as well as the bottom and top of the brick, are thus cleaned all at the same time. The machine is 4ft. long and weighs 400lb., so that it is readily portable. It is placed upon a platform or truck, so as to be about breast high. It can be operated by either one or two men, and with an engine of 2½ H.P. its capacity is fifteen bricks a minute. It can be adjusted to work slow or fast, as desired.

MEETINGS FOR THE ENSUING WEEK.

FRIDAY (To-day).—Institution of Municipal Engineers, Council Meeting, 7 p.m.
Smoking Concert, 8 p.m. Mitre Hotel, Manchester.

SATURDAY (To-morrow).—Institution of Municipal Engineers at Manchester. Visit to Stalybridge and the Filters and Waterworks at Brashes and Ashway Gap, 1.55 p.m.
Edinburgh Architectural Association. Visit to Oxenford Castle.

Mr. Herbert L. Bottomley, assistant borough engineer, Brighouse, has been appointed surveyor and waterworks manager to the Hebden Bridge Urban District Council.

A scheme was suggested at Friday's meeting of the Middlesex County Council for dealing with floods by the construction in the Thames of "by-passes," the removal of shoals, and most of the islands, sharp bends, etc. The total estimated cost was £300,000; but the council disapproved of the scheme.

The statue of King Edward VII., which has been erected in Victoria Park, Leith, will be unveiled to-morrow (Saturday) afternoon. The statue is in bronze, and is 8ft. 9in. in height; it shows the monarch arrayed in the robes of a Knight of the Thistle. It stands on a pedestal of white Kenyan granite, of Classic design. Mr. J. S. Rhind, of Edinburgh, is the sculptor.

At the meeting of the Salford Town Council on Wednesday next, the Finance Committee will bring forward a recommendation that advertisements be issued inviting applications for the position of borough engineer and surveyor at a salary of £900 per annum, rising by biennial advances of £100 to a maximum of £1,100 per annum. A new schedule of duties for the position has been formulated, and the council will be invited to adopt it.

The members of the Leeds Corporation on Monday paid their annual visit of inspection to the Leighton reservoir works, in the Ure Valley, above Masham. The Leighton Reservoir, the construction of which was begun in 1908, is the first of a chain of four reservoirs authorised for Leeds in the Ure Valley. Its completion is expected in about eighteen months' time, and it will provide 4½ million gallons of water daily for Leeds. The works are being carried out from plans by and under the direction of the waterworks engineer, Mr. C. G. Hensell, and his chief assistants, Mr. J. K. Swales and Mr. H. Shortreed, the contractors being Messrs. Arnold and Son.

Trade News.

WAGES MOVEMENTS.

DUNDEE.—At a meeting of Dundee operative plumbers on Saturday, it was intimated that the Master Plumbers' Association had resolved to rescind the by-law which gave rise to the dispute. In terms of this by-law a notice was posted intimating that the federated employers would not engage any operative who after June 22 worked for any employer who was not a member of the Masters' Association. Work was consequently resumed on Monday morning.

EXETER.—The dispute in the building trade of Exeter still continues. The painters and carpenters have accepted the additional 3d. per hour which the employers offered, in place of the penny extra, which was asked for; but the bricklayers and plasterers refused, and held out for their additional penny, making the demand, also, that certain alterations should be made in the rules of working. The notices having expired on Tuesday evening, the bricklayers and plasterers went on strike the next morning. They are willing to accept a 3d. per hour now, if the employers will guarantee them another 3d. in October. They state that 8d. per hour, the present rate, does not average more than £1 a week after deductions have been made for lost time, and that 8d. is low, even for the West of England.

FALKIRK.—Joiners employed in Falkirk district went out on strike on Friday as the result of a dispute on the question of wages. Some time ago the workers, whose present wages are 9d. per hour, requested an increase of 2d. per hour. The employers refused to concede this, and offered 3d. Subsequently the men's demand was reduced to 1d.; but the employers decided to hold to their offer.

The engagement is announced of Lady Bamford-Slack, widow of Sir John Bamford-Slack, formerly Liberal M.P., for Mid-Herts., with Mr. Banister Flight Fletcher, F.R.I.B.A., F.S.I., eldest son of the late Professor Banister Fletcher.

The Lindsay Institute, Lanark, was opened on Thursday in last week. The institute has been built and endowed with money left for the purpose by the late Mr. Charles Lindsay, of Ridge Park, Lanark, and has cost over £5,000. In the building are a lending library, reading-room, museum, reference-room, lecture-room, billiard-room, and librarian's room.

At the meeting of the Council of the East London College (University of London), held recently, it was announced that the Court of the Drapers' Company had resolved to defray the cost of the erection and equipment of the new chemical laboratories of the college. The cost will amount to approximately £15,000, and the laboratories will be available for students' use in October next.

The first sod was cut on Monday on the site of the new church of St. Peter, Goosehill, Stretford, about to be built at a cost of £6,750. The church will be Free Gothic in style, height 36ft., length 110ft., and width 34ft. The plans have been prepared by Mr. Ernest Woodhouse, F.R.I.B.A. (Messrs. Woodhouse and Howard, architects, Manchester), and the tender has been let to Mr. J. F. Moore, Eccles.

The Lord Mayor of Birmingham on Saturday opened a new suite of cottage baths erected in Lower Dartmouth-street. The building makes the fourth of this type of establishment installed by the City Council. Accommodation is provided in the centre of the block for the attendants in charge, the right wing being provided with eight private baths for women, and the left with sixteen for men. The cost of the site, buildings, and equipment is estimated at £3,005. There is a sufficiency of land for the addition, if necessary, of seven additional baths for men and three for women. Messrs. Webb, of Birmingham, were the builders.

In regard to the proposed motor relief-road between Thornton Heath and Purley, by which through traffic will be able to avoid the narrow main street of Croydon, the Road Board, in addition to the £30,000 originally promised, now offers £19,000 to cover the cost of widenings at each end of the new thoroughfare, which will be nearly four miles long and will average 60ft. in width. The cost to the Croydon ratepayers is estimated at £19,743, and in the event of that amount being exceeded the Road Board will consider favourably any application made for a grant to cover the excess. At the same time, the Ecclesiastical Commissioners have conditionally increased their offer of £5,000 to £7,000.

Our Illustrations.

THE NEW ST. PAUL'S BRIDGE, LONDON.

Last week we gave illustrations of all three of the premiated designs in this competition, and to-day we publish the general drawings of the first prize scheme, by Mr. G. Washington Browne, R.S.A., and those of the second prize design, by Mr. Charles E. Barry, A.R.I.B.A. In our review of all the designs last Friday reference was particularly made to the perspective view of Mr. Washington Browne's bridge piers, and this drawing we have included among our plates to-day. It will be noted by the general drawings how the author has arranged his pylons at the City extremity of the bridge, with the adjacent obelisks forming a befitting composition to mark the "Place" at the termination of the approach from St. Paul's Churchyard, where sculpture occupies the twin niches level with the eye of pedestrians. The stairways on the Surrey side of the bridge, shown by our double-page perspective illustration last week, are seen in geometric elevation and plan to-day, as well as in the sectional drawing set out over that as further illustrating the position of the pylons at the northern end, from whence a view of the river and bridge can be so well obtained. The relative levels of Queen Victoria-street, Lambeth Hill, and Upper Thames-street are given by the section depicted below the

HOUSE AT ST. GEORGE'S HILL, SURREY.

Messrs. CASTLE and WARREN, Architects.

general plan of the bridge, while to the left of the sheet may be seen the shops in the abutment buildings to the iron viaduct over Queen Victoria-street, with the pair of open stairways accommodating the ground lines of these several levels in Queen Victoria-street and Lambeth Hill at the points where the public staircases occur. The plan below the approach level plan explains the situation of these stairs, bridges, and shops. It is only by examining these details carefully that the relative merits of this first premiated scheme can be adequately compared with the other designs. A sweeping generalisation or concise criticism is entirely beside the mark, and, of course, must be more than misleading. Mr. Washington Browne has designed his bridge to be built in granite, the abutments and contiguous details being planned for execution in Portland stone. The skyline of the parapet is slightly cambered, and when built will look, no doubt, perfectly horizontal. Our second double-page illustration is devoted to the further representation of the £200 premium design by Mr. Charles E. Barry, A.R.I.B.A. His general perspective of the bridge was given last Friday. Below the whole length elevation and plan reproduced to-day is a detail of the central span showing more fully the arrangement of the covered-in colonnaded ways for pedestrians on each side of this bridge. The sec-

tion at the side makes the arrangement of these features all the more clear, besides representing the contour of the projecting bastions, which necessarily assert themselves when seen in perspective. The north end abutment building, with the public conveniences on top, is displayed by the general drawing of the façade of the whole bridge, and section A B gives an idea of the projection of the colonnaded approach from the bridge pavements to these lavatory buildings, which flank the entrance to the bridge from Cannon-street and St. Paul's Churchyard. At an early date we shall publish details and views of the third premiated design, by Mr. Edward R. D. Selway, A.R.I.B.A., whose perspective of his piers and arches will be found among our previous illustrations.

APLEY GRANGE, HARROGATE.

This work is now nearing completion. The materials used for house, lodge, stables, and garage are sand-faced bricks and green slates, sash windows, and shutters. The architect is Mr. Edwin Cooper, F.R.I.B.A., 4, Verulam Buildings, Gray's Inn, W.C. Our illustration is reproduced from the drawing now on view at the Royal Academy Exhibition.

HOUSE, ST. GEORGE'S HILL, SURREY.

The drawing herewith given is now at the Royal Academy Exhibition, illustrating a country house shortly to be commenced on a fine site overlooking splendid views, mainly obtained from the

garden front. The building will be mostly faced with stone. The aim of the architects has been to reproduce the feeling associated with the simple 16th-century farmhouse type applied to modern requirements, and the interiors have been arranged so that the old furniture may take its place and be in harmony with the house. The work will be carried out from the designs of Messrs. Castle and Warren, architects, Amberley House, Norfolk street, Strand, by Mr. W. G. Tarrant, to whom praise is due for the unique development of the beautiful estate of which the site of this house is part.

The Board of Education announce that on and after Wednesday, July 1, 1914, admission to the Victoria and Albert Museum will be free every day.

During his visit to Shrewsbury for the Royal Agricultural Show to-day (Friday), the King will lay the foundation-stone by electricity of the new library at Shrewsbury School. The building is Jacobean in style, and one story in height, and is being erected to house the Old School Library and the collection of English water-colours which Mr. E. B. Moser, an Old Salopian, who resigned in 1911, after being a house master for 26 years, has expressed his intention of bequeathing to the school. It will also contain a reading-room for the use of boys below the sixth form. Messrs. Forsyth and Maule, F.R.I.B.A., of Oxford-street, are the architects.

A new "Ideal Domestic" Boiler.

A new intermediate size of the Ideal Domestic Boiler Series—the No. 11D—is now available and can be supplied promptly from our Hull Works.

IDEAL & IDEAL
RADIATORS & BOILERS

The No. 11D Ideal Domestic Boiler has an hourly capacity for hot water supply of 42,000 B.T.U.—equivalent to 28 to 84 gallons, according to the temperature required.

If you have not already received Catalogue Inset giving full particulars, a copy will be sent on request.

NATIONAL RADIATOR COMPANY
LIMITED.

439 & 441, Oxford Street, London, W.
Works: HULL, Yorks. Telephone Nos.: Mayfair 2153 & 2154.

Agents carrying Stocks of
Ideal Boilers and Ideal Radiators.

BAXENDALE & CO., Ltd., Miller Street Works, MANCHESTER.
WILLIAM MACLEOD & CO., 60, 62, & 64, Robertson Street, GLASGOW.

The Playhouse, Berwick on Tweed. Mr. S. H. Lawson, Architect.

TIMBER FOR BUILDING.

Timber, like coal, we are told, is being rapidly exhausted. What with the never-ending and ever-increasing demand for railway-sleepers, and for wood-pulp for our newspapers, we may have in the near future to find some other material from which to manufacture our doors and windows; for though trees are being planted, they do not make wood fast enough to supply the world's needs. Nature needs a hundred years at least to make a tree up to the architect's specification, in pines, or firs; and in some climates the trees would in that time be no more than 9in. in diameter, and the bulk of them half sapwood. We used to wonder, in our younger days, why scaffold-poles decayed so rapidly; but we discovered, of course, that the reason was they had little heartwood. A pole 6in. diameter at the butt, the growth of fifty years, would have 2½in. of sapwood. Out of over 200 Russian poles that we once examined at the Millwall docks, not one had any heartwood, and none were less than 5in. in diameter, and yet some of these were 70 years old. But we need not despair, some say, about this prodigal use of timber, for we are assured by enthusiasts that the time will come when timber will not be used at all in buildings, because steel and concrete will displace it, though, at present, there is little sign of their doing so, except in the monster hotels and warehouses of our great cities.

It is indisputable that steel should take the place of wood for bearers across any span, say above 12ft., even in villas and labourers' cottages; for wood, being elastic, will gradually sink, even under a load of its own weight, when it is used as a girder or purlin. The strongest wood beams that the experience of the practical carpenters of a few centuries ago could suggest as being reliable are now found to have failed under weights they carried with safety for a few years. In pulling down a warehouse in Lime-street a few years ago, we found the main girders of a floor down 2in. in the centre, though they were 14in. square, and the span only 16ft. These floors were framed immediately after the Great Fire, and there was four times more timber in them than any builder would think of putting in a floor of the same span to-day. All these old floors were divided into bays, with joists spanning not more than 8ft.; but with all the timber used in them, they sunk in the centre, and this must have been reckoned on when it is considered how elastic a material timber is.

In many old buildings the roofs will be found hollow between the purlins; for

these have sagged under the weight of the slates and rafters. We have seen cases where the purlins have broken across with the weight, at a knot. Again, the purlin may span too great an opening or the scantling may be too light. In every case, therefore, floors should be stiffened with steel, and purlins may be altogether of that material, even for workmen's cottages. It would be well to bear in mind, when using steel as we suggest, that it is not fire-proof, and that in some cases it may be desirable to protect it with concrete. Many years ago, when surveying a large house in the Midlands for alterations, we were surprised to find all the floors on the second story were finished with some kind of hard, polished cement. This was ordinary lime mortar, carried on laths across the joists, the surface being worked up in putty until it was strong enough to bear the furniture and the usual traffic of bedrooms without breaking up. We were informed that these floors were common in the district. It seems that since the introduction of Portland cement, a better material for the purpose is to hand than any the builders had a century ago, although it is not now used for the purpose. If a fireproof concrete floor is carried out in offices on the first and higher stories, provision is always made for attaching ordinary prepared flooring to the concrete. No one thinks of finishing the surface with cement of any kind. The old floors we refer to were reserved for the servants' apartments.

The thorough seasoning of wood for joiners' work is a matter of the first importance, not so much on account of the risk of failure by shrinkage, as of the strange irregularities of the finished face when drying, after being tried up and polished by the smoothing-plane. This latter failure is not even noticed in any book on building construction. To explain this it will be necessary to consider how the surface of a planed piece of wood is made up, and this is dependent on the structure of the tree itself. In transverse section it shows a number of rings, speaking roughly, from ¼in. to 1.32in. in thickness. Each ring is a hollow cylinder; and the trouble is that a ring being a year's growth, it is built up with two kinds of wood, which shrink unequally. In the early spring the bark of the tree bursts with the rising sap, and pressure is released in this way on the wood of the new ring being formed, so that it is comparatively loose in texture; but the bark knits together again gradually, and the making of the ring is finished up with wood fibre deposited under great pressure, and consequently hard. But for this difference between the spring and summer wood,

it would not be possible to distinguish the annual rings; and some trees are partly deficient of such indications—yellow pine, for instance. Now, when a piece of wood is planed, that is not thoroughly seasoned, no matter how true the surface may be, that surface will, when the wood seasons, be a series of corrugations, owing to the unequal shrinkage in each ring; and if such a surface is varnished, all these irregularities will show up. In the room where we sit there is a matchboarded dado, and opposite to it a large window. When one is seated between the two, the surface of the matched boarding is seen to be wavy and felt to be rough, and as it is certain that no machine could ever have turned out such work, the irresistible conclusion is, therefore, that these surface indentations were produced by the seasoning of the wood. There is another peculiarity about these boards. Though each was turned out of the mill with plane surfaces, none of the surfaces are now planes. They are round or hollow, though they are only 5in. wide. This kind of failure has been noticed in books on building timbers, so it need not be explained here. It will be enough to say that it results from the way the wood is cut from the log—that is, with the greatest dimensions radiating or tangential. It is not of the slightest use for an architect to specify the kind of timber he wants in his building, for the builder does not "manufacture" it. By manufacturing, we mean, of course, converting the log or trunk of a tree into scantlings. Moreover, neither the architect's specification nor his authority reaches the manufacturer. The architect must put up with the best the builder can give him, unless he imports logs of whatever wood he wants, and has them "manufactured" under his own superintendence.

It is well to bear in mind that all foreign scantling comes to us as "first," or other qualities, and that the nature of these is determined by brackers—men specially licensed for the work by the public authorities of the various wood-growing countries. The qualities are distinguished by the bracker's marks on the ends of the timbers, the Swedish being letters stencilled in red, and the Russian names or letters dry hammer-marked without colour. Some manufacturers send out no less than five qualities, or six, if an unsorted one is included—that is, in some scantlings; but seldom more than three qualities in planed wood, or four, counting an unsorted one, as before. The architect must have seen red letters on the ends of the deal battens and boards being used on his buildings. These are the bracker's marks; and if he could

only discover what these marks mean, he would know what quality the wood was rated at. Unfortunately, every manufacturer has his own marks, so that it would not be possible to recollect them all. The selection of these shipping marks, as they are called, is purely arbitrary; in one case the initials of the shipping port are used, in another that of the manufacturer. It would be a lifelong study for the architect to make himself acquainted with all, and it is a satisfaction to remember that an acquaintance with them is, for the architect, more a matter of curiosity than of value in guiding him to the selection of good timber, and what any bracker may consider good or bad timber need not concern him, and he is in no way bound by it. The important thing to be considered—and it is altogether beyond the architect's control—is the way in which the scantlings necessary for his joinery have been cut from the log, and this can always be seen by examining the end grain of the wood. The danger of irregular shrinkage is always greatest when unseasoned stuff is used, and this shrinkage may be seen illustrated in so many books that we need not attempt it here. A very simple illustration of bad wood conversion may be seen in the prepared flooring with which the market is flooded. This is usually cut tangentially instead of radially, hence the rings splinter up, which they could not do if the edges of the rings were exposed to wear on the face of the board. This point, though one of the first importance, is wholly neglected by manufacturers, and it does not reckon in judging the qualities of the boards. Trees are felled and converted into every conceivable scantling, from 11in. by 4in. to 1½in. by 4in., to pay, and not to satisfy the requirements of an architect's specification.

Formerly, a log 21in. or 22in. square had a cut put down the centre "to see what the log would open like"; and then, on the ends of each of the fitches, suitable pieces for framing and panelling were marked out, the coarser pieces being set aside for carpentry. Now the builder is saved all trouble in this respect, for the logs are converted into scantling abroad—generally 11in. by 4in., or as large as the tree will yield, including the sapwood; all the smaller scantlings, such as 4in. by 2in., being cut from trees about 7in. in diameter; for no millowner would think of cutting a log into 4in. by 2in. scantling that would cut 7in. by 3in. or larger. The big scantlings cost the most, when imported timber is being dealt with; but if we cut up imported logs, then the reverse is true, and the smaller the scantlings into which the log is cut, the more costly they are. The reason for this apparent anomaly is that the foreign manufacturer finds so few trees that will cut 11in. by 4in., he has to charge accordingly; but he has an unlimited number that will cut 4in. by 2in. If, however, the builder buys a log to convert it into small scantlings, he finds the sawing increases the cost, and, consequently, the smaller the scantling the more it will cost him. At the present time, the only possible way that an architect can get Baltic timber free from sapwood is to have it cut from the log; not sticks 6in. and 8in. square, but 20in. or 22in. square, for the former will be nearly all sapwood. For conversion, length is not of so much importance as sectional dimensions, for it is here the sapwood tells. It will be obvious that it would never pay a builder to cut logs into plastering-laths, the smallest dimensions in the trade; they are usually from 4ft. to 4ft. 6in. long, 1in. by 3-16in., the first quality selling for 8½d. per bundle. In old specifications, where floor-joists exceeded 1½in. wide, there was a provision for roughly chamfering the under edges of

the joists where they carried the plastering laths, so as to give a better key for the plastering. This was because the sawn face of the joist was too smooth to hold the rendering; but now acres of this foreign-sawn lathing may be seen, offering a fairly smooth surface, and no key, for the architects do not object to it. We have had an extensive experience of this lathing, and we have no hesitation in saying that laths split by hand from suitable Memel lathwood cannot, for good work, be equalled by any sawn or metal lath on the market. In this country oak was formerly used for plastering-laths, and there was a distinction made between heart laths and sap laths. Baltic lathwood, as imported, is all sapwood, because the timber is of no use for anything else; and these sap laths appear to last a long time if they are kept dry, for the lime appears to preserve them. In surveying old roofs, we have often noticed many rafters wormeaten; but those rafters that were lime-stained—probably because they were used for scaffolding—were free from worms. But there is no reason why foreign lathwood should not be heartwood.

THE ROME SCHOLARSHIPS EXHIBITION.

A more central place for the display of these works would have been more convenient, otherwise, no doubt, Crosby Hall, Chelsea, makes an excellent room in which to display competition designs of large size. The exhibition closes to-morrow. The Architectural Scholarship of £200, to be annually paid for three years, was won by Mr. Philip D. Hepworth, A.R.I.B.A., and the design placed second was given the Jarvis Scholarship of £200 for two years, provided by the Royal Institute of British Architects, and awarded also by the Faculty to Mr. Ernest Cormier. The subject set was "A British School in Rome," the drawings to be made during a period of three weeks at the Imperial College of Science and Technology. Considering the scale and character of the drawings, the winning designs are remarkable.

THE ARCHITECTURAL SCHOLARSHIP.

The Palatial Terraced scheme by Mr. Hepworth is located on an elevated plateau, with the main building linked up to subsidiary ones by open colonnades. Those to the front unite the twin projecting pavilions devoted to the directors' quarters and to the clerical offices. The dominating feature of the central block is the big portico façade, with a colonnade of six Corinthian columns, and behind the vestibule stands the cupola of the squarely-planned library. The problem was in this case dealt with not so much as an exercise of style, its character being reckoned national rather than local, so that the author elected to adapt the vernacular rather than a semi-correct rendering of the Italian. His plan is kept free and very open, no restrictions limiting the site. A deep slope of about the angle of 45deg. occurs at the back, and this correspondingly has influenced the design of the rear frontage buildings, with their ramping inclines, stairways, and terraces. The idea is monumental enough, and aims far beyond a students' hostel for 124 students. This precise accommodation has, however, been adhered to, and provision is made for 12 servants. Each student has a separate studio, and the provisions include three divisions—viz., residential, common, and public rooms. Two of the big studios have open loggias attached. The director is isolated, as those over whom he has to preside are occasionally noisy. Top lighting is considered undesirable in Rome, on

account of the heat, so side or vertical windows are adopted. More space is given to sculptors than painters and architects. The kitchen department is located in a good basement. Hard by the flanks of the central library are two long galleries, one on either hand, for the display of drawings, paintings, and restorations from the antique. The entrance cortile behind the portico extends by attached wings to the whole width of the building, which includes the Dining Hall, with a servery at the far end, and also the Common room, which is furnished with a stage. Both these rooms open into the cloistered colonnades. There is a passage-way round the exterior of the library proper, and this passage has galleries over it above the columned fronts, and opening into the central area by main archways between the pendentives of the dome surmounting the whole. A long exhibition gallery is placed at the rear, corresponding in length with the vestibule before named, and behind this is the amphitheatre, with a rostrum for the professor, who has a top-lit retiring room, with lavatory, etc., and beyond this are colonnades. The studios for architecture, painting, and sculpture range east and west, set at right angles with the main block of the school and the cypress walks beyond. The fourth block, completing the symmetry of the lay-out, is devoted to sculptors' private studios. The dominating tout-ensemble of this scheme comprises the steps and terraces, which are shown by Mr. Hepworth's large pencil perspective, illustrating the water side to the rear of the college. These exigencies of this rampart site, with all the gradient recurrences and recessed alcoves on the terraces, tend necessarily to diminish the scale of the citadel-like grouping of the school. The studios have their windows towards the main approach, and at the ends are attached colonnades, but these studios have the effect of sheds from the pictorial standpoint seen in this perspective. The designs are mostly in pencil, tinted quietly, and show a power of delineation, with spirited sculpture well put in, the whole being handled in a scholarly manner.

THE JARVIS SCHOLARSHIP.

Mr. E. Cormier, the Jarvis prizeman, submits a very restless set of drawings, the effect of the plan being lost by its over-elaboration and by reason of the triple terraces repeated down the ravine before mentioned. In elevation, the great library dominates all else behind the entrance vestibule, and on either hand of the vestibule are T-shaped exhibition galleries ending in each case by oval-planned cortiles, one forming the privy entrance for students, and the other the entrance to the director's house. Next the library are set the lecture hall and dining-room, both being of the same shape of a long parallel in proportions. The common room seems unduly large, extending as it does the whole width of the building, and set out in three sections. Big blocks of studios occur to the back, east, and west, having a set of private rooms grouped round the general studio in each case. The architects have a drawing office. The sculptors are similarly housed. This design is Italian broadly handled and well detailed, also forcibly drawn, though not particularly imaginative or original. In some respects we prefer Mr. Cormier's original sketch to his finished design.

THE OTHER SIX DESIGNS.

The design by T. Braddock is perhaps the best of the remaining six, and we are disposed to place him third in merit; but the conception of his scheme is beyond the scope of such a school, and out of cha-

acter with its limitations and practical needs. This same remark applies to the first two proposals. It is said that when the Academy schools were in hampered quarters at the back of the National Gallery, the students did better and more serious work than they ever have done since. The main block of Mr. Braddock's plan is apsidal-ended, and surrounded by four open courts having cloister colonnades joining up the surrounding keeping rooms for the students, besides the director's quarters in front. The big studios for Painting and Sculpture are set on the radial line at the back, while the Architectural studio comes in the middle of the rear range of inclosing buildings, with its loggia and centre piece repeated cleverly to the pair of studios set on the diagonal. The dining-room and library flank the domed reception room, which is over-elevated and crowned by a vast lantern cupola. The detail is better than the relative scale of this composition as a whole, and its proportions fail.

Mr. W. M. Keesey colours his plans crudely, but his scheme is more compact and reasonable, if it is somewhat ineffective.

Mr. D. S. MacPhail is less playful—indeed, his main front is somewhat prison-like; and Mr. B. A. Miller favours the casino type too much.

The Sculpture Scholarship is taken by Mr. C. S. Jagger for a relief 5ft. by 3ft., for a Private Concert Hall mantelpiece. The model of the chimney-piece is rather good. Stevenlike figures support the overmantel, which has in the frieze the legend, "He who hears music feels his solitude re-peopled." Statuettes occur on either side of the panel, in niches. The allegorical subject of the centrepiece represents satyrs, virgins, and music, rather restless, but managed without attempting symmetrical arrangement. Above are leopards silenced by the minstrel centre figure playing the lyre.

We prefer Mr. Wilcoxson's scheme. His panel is very quiet and charming, the whole being a better-built up design, and more in scale from floor to ceiling. We presume the panel settled the award.

The decorative painting of "The Judgement of Paris" in oils, which won the Scholarship is by Mr. J. M. B. Benson.

THE LONDON COUNTY COUNCIL.

At the meeting of the London County Council on Tuesday, the Establishment Committee reported that the Council, on February 1, 1910, accepted the tenders of Messrs. John Leaning and Sons and Messrs. J. Rider Hunt and Co. to take out quantities for the first section (A) of the substructure and superstructure of the new County Hall, at a remuneration, divisible in equal proportions between the two firms, of seven-eighths per cent. of the cost of the works, and on February 20 and July 30, 1912, accepted the offers of those firms to prepare the quantities for the second and third sections (B and C respectively) of the substructure and superstructure of the new building, at the same rate of remuneration. It is now desirable, the committee reported, to obtain quantities for section D, which is to be erected on the portion of the site now occupied by Holloway Brothers (London), Ltd., and the two firms referred to have offered to take out these quantities at the same rate of remuneration as that for which they prepared the other quantities, and to complete the work within ten weeks from the date of receiving the drawings. The committee recommended that this offer should be accepted. The cost of the work is estimated not to exceed £2,350.

The Local Government Committee recommended the acceptance of the tender of Messrs. W. E. Blake and Co., Fulham, amounting to £98,980, for the erection, within a period of twenty-one months, of the

new Sessions House at Newington. The new Sessions House, designed by Mr. W. E. Riley, F.R.I.B.A., architect to the London County Council, was illustrated in our issue of January 30 last. The recommendation was received.

It is reported that in response to a suggestion by the Council, the Great Western Railway Company have agreed to procure a halt on their new line from Ealing to Shepherd's Bush at the point where it will cross Erconwald-street, on the Old Oak Estate.

The Improvements Committee recommended that as part of the widening of Lambeth-road, near Lambeth Palace and the Albert Embankment, authorised in March last, and estimated to cost £41,000, three houses, Nos. 129, 131, and 133, Lambeth-road, be demolished, at a cost of £500. The effect will be to widen the road for a distance of 40ft., from a present width of from 41ft. to 38ft., to a minimum width of 63ft.

The Main Drainage Committee reported that the Council, on December 14, 1909, accepted the tender, amounting to £481,553 9s. 11d., of Griffiths and Co., Ltd., contractors, for the construction of the Southern low-level sewer No. 2 from Battersea to Deptford. The work has now been completed and the chief engineer has issued the final certificate. The actual cost of the construction of the sewer has amounted to £424,847 4s. 5d., and the total net cost of the work, including the provision of penstocks, etc., will amount to £445,040 8s. 3d., showing an ultimate saving in the gross amount of the contract of £36,513 1s. 8d.

Trailer cars, the design of which has been approved by the Board of Trade, are to be placed on certain additional tramway routes in South London, and a recommendation from the Highways Committee was submitted for the acceptance of a tender from the British Electrical Engineering Co., Ltd., of £74,200 for the supply of 150 trailer cars and equipment. The committee estimate that a trailer car can be operated for about £338 a car a year less than an ordinary electric car.

FROST RESISTANCE OF BUILDING STONE.

The most reliable sources whence practical results of resistance have been obtained are the signs of weathering in stones under actual building conditions. Where and when circumstances permit, it is best to submit the stone that is to be tested for several years to all the influences of weathering and then decide on the strength of the extent of exfoliation, cracks, and rifts exhibited.

The methods of saturating a little cube with a solution of glauber salt and then freezing it is all very well in theory, but in practice there are several objections. In the first instance, the resistance which stone offers to the solution is very different to that offered to water. It is well known that water when freezing expands, and exerts an enormous pressure. Now, through the addition of the glauber salt this very tendency of the water is obviated and in fact reversed, for salt of any kind is conducive to contraction. Water, therefore, remains the only reliable means for testing the resistance of stone, but the cubes must not be entirely covered by water, as in that case the air contained in them has no means of escape; they must be slowly immersed, so that the air can gradually escape as it is being replaced by water. The water is warmed to a temperature of 16 to 20deg. C., and to ascertain the maximum saturation coefficient of the sample, is weighed before and after saturation. If finally, after repeated weighing, the weight remains the same, it is assumed that the maximum point of saturation has been reached. The samples so saturated are frozen for five hours in a temperature of 12 to 15deg. C., and then thawed again in distilled water under a temperature of + 15deg. C. This is repeated from 20 to 30 times. To obtain the necessary cold broken ice and freezing salt is used, and the samples are then, without being dried, submitted to pressure in order to ascertain their crushing strength when frozen, which is com-

pared with the stone when not frozen, serving as a basis for the resistance offered by calculating the relative frost resistance.

The lower the difference of the crushing strength before and after freezing, the smaller the exfoliation and the cracks, the greater the frost resistance. At first sight it seems plausible enough that the frost resistance should increase correspondingly with the decrease in capacity of absorption, and that frost resistance is in an inverse ratio to the porosity of stone. Practical experience, however, proves the opposite. Soft and porous stone is held to be particularly frost-resisting, and hard and brittle stone with few and small pores of but small resistance. The reason, of course, is that with the softer stone the pores give way to the freezing pressure more easily, whereas in the harder ones the constant compact resistance offered conduces to exfoliation, cracks, and rifts. The knowledge of the mineralogical components of a stone helps us to ascertain its weather-resisting qualities. Very harmful additions are principally carbonate of lime, pyrites of iron, and gypsum, and most desirable are consequently the most silicious stones.

The great importance attaching to whether or not there is any addition to the water is shown by the fact that basalt, under the influence of water, loses 2 per cent. of its dry crushing strength, whilst granite loses 8 per cent. It is proved that stone showing a high frost resistance will endure against water, but naturally it must not be assumed that the addition of salt and other materials is superfluous, nor must we overlook the necessity of experimenting with the inclusion of various materials of different stone and their composition. The different methods of testing should not replace, but supplement and complete each other.—*Stone Trades Journal.*

AN OVERLOOKED TENDER AT WALLASEY.

We reported last week, on p. 8, that the Education Committee of the Wallasey Corporation had rescinded their resolution to accept for building a new council school in Valkyrie-road, Liscard, the tender from Messrs. W. Thornton and Sons, Liverpool, for £18,107, it having transpired that a still lower tender from another Liverpool firm (Messrs. Duthie and Son) for £17,750, had been left unopened and forgotten in the clerks' office. The committee accepted Messrs. Duthie's tender. When, however, the matter came before the town council itself, that body unanimously decided to adhere to the original resolution and to accept Messrs. Thornton's tender, as at first proposed.

Alderman Dawson, on the consideration of the minutes of the education committee, proposed that the resolution in regard to the acceptance of a tender for £17,750 for the erection of a new council school in Valkyrie-road, Liscard, be rescinded, and that the previous resolution, accepting the tender of Messrs. W. Thornton and Sons, Liverpool, for the sum of £18,107 be confirmed. There had, he said, been a technical error, which perhaps need not be discussed. It was, perhaps, unfortunate that a slightly larger amount had to be paid, but he thought, under the circumstances, that what he proposed was the best course to be adopted.—Alderman Peace seconded, and the motion was unanimously carried without further comment.

A Local Government Board inquiry has been held at Mountain Ash into an application of the urban district council for sanction to a loan of £40,000 for water-supply works. Messrs. Fox, Moore, Bateman, and Fox, Victoria-street, Westminster, are the engineers.

The foundation-stone of the new church of St. Luke was laid on Monday at West Hartlepool. The site is at the corner of Hart lane and Tunstall-avenue, and the new church, which will be of stone, will be Early English in style and cruciform in plan. The entire scheme will cost £7,662; but at present it is only intended to erect the nave, aisles, transepts, and tower. Accommodation for 500 persons will be provided.

E 2204. Fixed Oil-engine.

E 2229. Portable Oil-engine.

OIL-ENGINES.

Many of our readers will be interested in a new catalogue just published by Messrs. Marshall, Sons, and Co., Ltd., Britannia Ironworks, Gainsborough, of their different types of fixed and portable crude-oil engines made on the semi-Diesel system.

Comparatively few readers seem alive to the advantages of the oil-engine, thanks probably to want of enterprise on the part of makers. Messrs. Marshall, Sons, and Co. not only manifest the ability to produce a most successful engine, but the ability and disposition to bring its advantages to the knowledge of users, and the result is daily increasing additions at home and abroad to the numerous users who, without exception, testify to the economy and convenience of their engines.

Engines of the internal-combustion type are invariably operated by means of an explosive mixture of oil-vapour, or gas, with the correct proportion of air, exploded under compression. The primary difference between the oil-engine and the gas-engine lies in the fact that the former generates its own vapour from the oil which is injected into it. In the semi-Diesel type of oil-engine, a charge of air is first drawn into the cylinder and compressed, and at the correct moment, oil is injected in the form of fine spray. The temperature of the vaporiser due to the heating-lamp, or previous explosions, suffices to fire the new mixture.

The "Marshall" crude-oil engine successfully combines, as far as possible, the economy of high-compression oil-engines with the advantages pertaining to the reduced working pressure of low-compression engines. At the same time, it possesses a marked superiority over both types as regards its simplicity. Where oil is obtainable, the oil-engine provides the easiest means of generating power, as it is readily started, requires a minimum of attention, and needs very little cleaning. The "Marshall" oil-engine compares very favourably with the steam-engine in smoothness of running, reliability, and capability of making long continuous runs. The engine is designed to work on the well-known two-cycle principle. No air- or exhaust-valves are required in the cylinder-head, and by the elimination of such valves and their complicated operating-gear, the chief trouble with oil-engines has been overcome. With the two-cycle design, a regular turning effort is obtained. The fly-wheels receive an impulse every revolution, and as the explosion-pressure is not greatly in excess of the compression-pressure in the cylinder, impulses are given without shock, and, consequently, very smooth-running results. The "Marshall" engine operates on the semi-Diesel system, and will work with crude, refined, and residual oils. The compression-pressure in the cylinder (approximately 175 lb. per square inch) is sufficiently high to insure the maximum economy in working, but it is not great enough to render starting difficult.

The "Marshall" oil-engines are designed for universal service. The series of fixed engines are especially well adapted for driving all classes of stationary machinery where small powers are required and they are also readily adaptable for electric-lighting installations. The portable series are thoroughly suited for agricultural purposes, such as the driving of threshing-machines, cotton-gins, pumps, and other machinery on farm or estate, at home or abroad. The portable engines will also make a strong appeal to contractors. They can be employed equally as well as an ordinary steam portable engine as a source of motive power, they have the advantage of being always ready for work at

a few minutes' notice, and stand-by losses are almost entirely eliminated.

We give herewith illustrations of two types of engine. One, E 2229, is a portable engine, which will commend itself well where requirements demand the easy transfer of power. The other, E 2204, shows a fixed engine, the permanent installation of which will prove infinitely more advantageous to many than a steam- or gas-engine, rendering the user independent of coal and gas. We are sure hundreds of our readers will find one or the other save them money and give complete satisfaction.

PROFESSIONAL AND TRADE SOCIETIES.

THE EDINBURGH ARCHITECTURAL ASSOCIATION.—A large party of members of this association visited Oxenford Castle on Saturday afternoon, by permission of the Earl of Stair. Mr. Hippolyte Blanc, R.S.A., F.R.I.B.A., acted as leader, and a number of old plans and prints of the castle, showing the alterations made at various periods, were exhibited, these all being in Lord Stair's possession. Mr. Blanc read an interesting description of the castle, which comprises a groups of buildings erected at various periods from the middle of the 16th century. It was enlarged in 1780 by Robert Adam, and again in 1840 by William Burn, of the firm of Burn and Bryce, who added the present library, billiard-room, boudoir, and business room. The castle was originally founded by David MacGill, son of Sir James MacGill, Lord Provost of Edinburgh in the time of James V., and was King's Advocate in 1582. King James II. and VII. and his daughter (afterwards Queen Anne) were frequent guests at the castle, which contains a library of books and MSS., and many valuable paintings by famous artists.

THE ROYAL ARCHÆOLOGICAL INSTITUTE'S SUMMER MEETING AT DERBY.—In anticipation of the summer meeting of the Royal Archæological Institute, to be held at Derby from Tuesday in next week, the 14th inst., until Wednesday in the following week, the 22nd inst., a comprehensive and carefully compiled programme has been prepared by the secretary, Mr. G. D. Hardinge-Tyler, and is issued in attractive green cover as a handbook. Each of the two-and-twenty principal buildings to be visited is described concisely and in detail, and is illustrated by a plan. Among these is Haddon Hall, reproduced by permission from our pages. The proceedings are arranged as follows:—

Tuesday, July 14.—Rail to Lichfield. Roman Station of Wall, to be described by Mr. Charles Lyman, F.S.A. Lichfield Cathedral Church (Mr. John Bilson, F.S.A.) Rail to Derby. Evening Meeting. Lecture in French on "Roman Sculpture in France," by Professor Eugene Lefèvre-Pontalis.

Wednesday, July 15.—Rail to Tutbury Castle and Church (Mr. Lyman). Rail to Derby. Rail to Wingfield Manor House (Sir W. H. St. John Hope, Litt.D.) Rail to Derby. Annual General Meeting.

Thursday, July 16.—Motor to Sawley Church (Mr. A. Hamilton Thompson, F.S.A.), Little Wilne Church (Sir W. H. St. John Hope), and Claddesden Church (Mr. A. Hamilton Thompson). Motor to Derby. Motor to Dale Abbey and Morley Church (Sir W. H. St. John Hope). Motor to Bradwell Church (Mr. Hamilton Thompson). Motor to Derby. Evening Meeting.

Lintern lectures on "Excavations at Margidunum, near East Retford," by Messrs. F. Oswald and T. Davies Pryce.

Friday, July 17.—Rail to Rochester. Motor to Croxden Abbey (Mr. Harold Brakspear, F.S.A.), and Wootton Lodge (Mr. Hamilton Thompson). Motor to Norbury Old Hall and Norbury Church (Sir W. H. St. John Hope). Motor to Ashbourne. Ashbourne Church (Mr. Hamilton Thompson). Motor to Derby. Evening Meeting. "Fourteenth-Century Chancels in the Midlands," by Mr. Hamilton Thompson.

Saturday, July 18.—Motor to Repton Church and Repton Priory (Mr. Brakspear). Motor to Melbourne Church, to Bredon Church (Mr. P. B. Cuatwin, F.R.I.B.A.), and Staunton Harold (the Earl Ferrers, F.S.A.) Motor to Malbourne. Motor to Derby over Swarkeston Bridge (Mr. W. Smithard).

Monday, July 20.—Rail to Bakewell. Motor to Youlgrave Church (Mr. P. H. Currey, F.R.I.B.A.), and Arbor Low (Professor W. Boyd Dawkins, F.R.S.) Motor to Bakewell. Bakewell Church (Mr. Brakspear). Motor to Haddon Hall (Sir W. H. St. John Hope). Motor to Rowsley. Rail to Derby. Evening Meeting, "Tombstone Inscriptions at Bardney Abbey," by the Rev. C. E. Laing.

Tuesday, July 21.—Rail to Bakewell. Motor to Tideswell Church (Canon Fletcher) and Eyam Hall and Church (Rev. F. L. Shaw). Motor to Chatsworth (Mr. J. P. Main, Librarian of the Hall). Motor to Bakewell. Rail to Derby. Evening Meeting, "Derbyshire Church Screens," by Aymer Vallance, F.S.A.

Wednesday, July 22.—Rail to Chesterfield. Motor to Barborough Hall and Bolsover Castle (Mr. J. A. Gotch, F.S.A.) Motor to Hardwick Hall (Mr. Gotch). Motor to Chesterfield. Rail to Derby.

Mr. F. R. Gibbins, of the city surveyor's office, Manchester, has been appointed engineer and surveyor to the Cheadle and Gatley Urban District Council.

A branch co-operative store in Gainsborough-road, Crewe, built at a cost of £2,000, was opened last week. It was designed by Mr. G. E. Bolshaw, architect, of Crewe, and the builders were Messrs. Mickelwright and Sons, of Crewe.

After some years of negotiation, the Gwyrfai Rural District Council on Saturday decided to proceed with the erection of a number of workmen's dwellings in the Ebenezer district on sites to be acquired from the Vaynol and Codd Helen estates on advantageous terms.

The new Church of the Annunciation in Bryanston-street, W., occupies the site of the well-known Quebec Chapel, which was originally a riding-school for troops, and was adapted for purposes of worship in 1759. The new church has cost £30,000, and contains a rood, with figures above, also of oak. The architect is Mr. Walter Tapper, F.R.I.B.A., of St. John's Wood.

The foundation-stone of a parish hall for King Charles the Martyr Church, Tunbridge Wells, has been laid. The building will include a hall with seating accommodation for 250 people, rooms for men's institute, boys' club, girls' club, Sunday-school teachers, cloakrooms, kitchen accommodation, and caretaker's residence. Mr. Stanley Philpot, L.R.I.B.A., is the architect, and the contract has been taken by Mr. Thomas Bates, a local builder, at £2,930.

Construction has commenced on the walls of the Manitoba Parliament Buildings now being erected at Winnipeg at a cost of 2,000,000 dol. The architect is Mr. F. W. Simon, F.R.I.B.A., of East Grinstead, Sussex, and Winnipeg, and the general contractors are Messrs. Thos. Kelly and Sons, of Winnipeg. We illustrated Mr. Simon's design—which was selected in competition by the assessor, Mr. Leonard Stokes—by plans and elevations in our issue of Sept. 27, 1912.

Corrente Calamo.

The sectional settlements in the London Building Trade Dispute are proceeding. The crane-drivers have followed the stonemasons back to work, and activity is restored thereby on quite a number of large buildings. The plasterers, the carpenters and joiners, and the general labourers have met the London Master Builders' Association during the week, but at the time of our going to press no final settlement with either was announced. At a conference on Tuesday of several leading London master builders who are not members of the London Master Builders' Association, it was announced that letters had been received from 225 firms, employing about 10,000 men, in which a willingness to assist the London Master Builders' Association to bring about a termination of the present position was expressed. It was unanimously resolved to hold a meeting of all the London master builders not being members of the London Master Builders' Association, on Tuesday next, and the London Master Builders' Association were invited to send representatives to the meeting. By that time we trust it will have been made manifest that anything like a general lock-out is unnecessary and inadvisable.

We have remarked more than once during the past six months that probably few realise how trouble in our own trades breeds trouble throughout the whole realm of industry, and causes loss and suffering in hundreds of instances not apparent to the ordinary observer. The strike at Woolwich Arsenal is a case in point. One of the engineers at the Arsenal was called upon to lay down a machine on a concrete foundation built by a non-unionist worker. The firm who had the contract for the construction of this foundation was an outside one, and the dispute in the London building trade compelled this firm to employ non-unionist labour. The Woolwich engineer refused to do his part of the work because of this employment of non-unionist labour. He was dismissed, and his dismissal led to a strike of all his co-workers, "in sympathy." The strikers at Woolwich contend that the outside builders temporarily employed on the foundation job were "strike breakers"—"blacklegs," they call them—and protest that the employment of ordinary non-unionist labour would not have led them to strike. Thus a Government Department of the first importance has been thrown out of gear by a one-man dispute, originating in a quibble. Fortunately, common-sense quickly prevailed on both sides, and the men returned to work yesterday, "as they were," pending an inquiry by a special committee of five appointed by Mr. Asquith.

Some of the daily papers are commenting on the apparent intention of the City Streets Committee, which, it is said, intends some dummy railings set up at the south-west angle of the space in front of St. Paul's Cathedral to mark the fence of a proposed underground lavatory. We are sure our gentle remonstrance will effect a change of site. We do not suggest that any danger to the foundations of the Cathedral is likely to result! But, really, considerations of decency alone should prompt the selection of another site. It is a little remarkable that contiguity to a church seems not infrequently to recommend the establishment there of conveniences of the kind to our

municipal authorities. A peculiarly flagrant, and frequently flagrant, instance at the eastern end of the Church of St. Mary-le-Strand, now happily abolished, was long tolerated by the old Strand Board of Works, and the City of Westminster apparently could find no more suitable location for its less obtrusive successor, at the east end of St. Clement Danes.

Sir Joseph Beecham has purchased from the Duke of Bedford the Covent Garden Estate. The price paid has not been disclosed, but it was understood that when Mr. Mallaby-Deeley entered into a contract of purchase from the Duke last December the figure was £2,750,000. The gross rentals appear to amount to about a quarter of a million yearly. Messrs. Goddard and Smith, Piccadilly, were the estate agents connected with the re-sale of the property, which has been disposed of en bloc. It seems, according to a statement published by Messrs. Freshfields, that in the early part of this year a dispute wholly unconnected with the financial aspect of the contract, but turning upon boundaries, arose between the Duke as vendor and Mr. Mallaby-Deeley as the intending purchaser. Legal proceedings were commenced for specific performance of the contract, after which an original offer by Sir Joseph Beecham was largely increased, and with Mr. Mallaby-Deeley's consent, an agreement for purchase from the Duke has now been signed. The extensive property is situated in no fewer than twenty-six streets, and includes, approximately, 750 buildings, with over 1,000 tenants.

We trust that a really national memorial to Mr. Joseph Chamberlain will fittingly mark the nation's regard for a man whom men of all politics will always admire for his powers of concentration and disregard of obstacles—qualities none too manifest in our present-day politicians. As a matter of course his statue will in due time find its place within the precincts of the Palace of Westminster. Mr. Gladstone, "Lord John" Russell, Lord Granville and Lord Iddesleigh are thus commemorated in the central hall, and Mr. Bright in the lower waiting-hall, while a statue of Sir William Harcourt is the only one in the members' lobby, where several pedestals remain unfilled, and this seems the most fitting place for one to Mr. Chamberlain. A worthy memorial might be set up outside Westminster, as in the case of Mr. Gladstone, at the eastern Strand entrance to Aldwych and Kingsway. There is also a proposal to mark specially in the Guildhall the City's appreciation of one who, descended from a family of its freemen, and a freeman himself, was welcomed enthusiastically there after his return from South Africa, and made in that historic hall the last great speech he ever delivered in London. An idea also is heard that there should be a memorial in Wiltshire to perpetuate the connection of his family with that county, it having been a son of Daniel Chamberlain, of the village of Laycock, who migrated to the Metropolis in the 18th century, and established the business of which Mr. Chamberlain's father was ultimately the head. All these are good in their way; but something more is wanted. The needs of the many activities which marked Mr. Chamberlain's career suggest the opportunity for a great architectural memorial of his fame, taking shape in a structure devoted to the enforcement of the Imperial needs ever present to his mind, and we hope

to see its character discussed at an early date, and that an adequate response will follow.

The failure of a contractor or a builder is, unfortunately, nothing new nowadays, though less frequent lately. But one recently reported in the Court of Bankruptcy (*Times*, July 4) may be worth a note, as pointing several morals. The liabilities were £13,165, and no assets had either been disclosed or realised. In the end the Registrar, upon statutory grounds—i.e., as required by the Act—suspended the bankrupt's order of discharge for three years. It is the causes of the failure that may interest others. In the first place he seems to have built flats in London, and their depreciation in value was one main reason for his catastrophe. The failure of flats in many parts of the West-End has certainly been colossal, and the fact should be full of financial warning to the unwary. Then he got into a big contract with a corporation to build a masonry dam. This is often a risky business over the estimate, quantities, and excavation. But this unlucky debtor did worse, for he also got into litigation over the job, in which way we have little doubt that he lost more money than he could ever have made out of the contract price. Beyond this there was a sort of speculation in building a theatre, etc., at Margate, that, no doubt, looked like a goldmine of the good period, but seems also to have turned out a frost and a financial failure. But, after all, a builder to live must build something.

The Port of London Authority issues an interesting volume dealing with the past and present history of the Thames and its docks. The letterpress is by Mr. Douglas Owen, and the illustrations, which are numerous and artistic, are by Mr. Charles J. De Lacy. The book briefly traces the rise of the Port of London, from its earliest days, and relates the circumstances which eventually led up to the creation of the Port of London Authority. The first enclosed dock area was the Howland Dock at Rotherhithe, which flourished as early as 1703. Its site now forms part of the Surrey Commercial Docks. It was, however, nearly a century later that the value of enclosed docks for the handling and protection of cargo came to be appreciated, and the West India Dock, the precursor of many others, was opened, with the active support of the great William Pitt. Besides dealing with the many-sided activities of the Port Authority, the book details fully their great scheme of improvements now in course of execution, and in particular indicates, by pen and picture, the general character and importance of the fine new deep-water dock now being constructed between the Royal Albert Dock and the river. Several of the illustrations of the new dock are in colours, and effectively suggest the great part which the enterprise is likely to play in the future commercial history of London.

In a pleasant lane at Woolton, leading from Woolton Hall into the country and contracting into a path which terminates at Halewood, is a wall in which are many worked stones, portions of fluted pillars, ornamental bosses, bits of arches, window carved work, etc. The wall is on the north side of the lane, and belongs to Mr. Shawfield, a former surveyor of Woolton. When examining the stones in the wall (writes a correspondent of the *Liverpool Daily Post*) I saw two masons' marks, but they were of

unusual pattern, and quite different from other mason marks found in South-West Lancashire. A couple of the best specimens from the wall have been given to Canon Howson, rector of Woolton, who has placed them in the rectory garden. One, a rose, is beautifully worked, and is as clear as when newly sculptured. The difficulty of ascertaining the age is real in this case, for Woolton stone is famous for its durability (it was chosen from sixty-two samples as the best and most suitable for special work at the Liverpool Cathedral). Query: From what building have these worked stones been taken? Did they come out of the Camera of the Knights of St. John of Jerusalem when it was demolished, or from the chapel or priory which the Benedictines had, also at Woolton?

CHIPS.

Special services have been held at St. Mary's Parish Church, Whittlesey, to celebrate the completion of the restoration, without accident of any kind, of the famous tower and spire, which provide a landmark over a wide area of the Fen country.

At Vancouver, B.C., operations are to commence shortly on a new hotel. The building will be eight stories high, and will cost 150,000dol. Messrs. Mitton and Gillingham, Vancouver, are the architects, and Messrs. J. J. Frantz Construction Company, Vancouver, the general contractors.

Mr. Nathaniel Saunders, of Albany Cottage, Dedham, builder, left estate of the gross value of £11,654, of which £8,412 is net personality. He left £250 for the erection of a memorial in Dedham Church to the memory of his seven deceased sisters, unless he shall have erected such memorial in his lifetime.

The urban council of Blackrock, Co. Dublin, have accepted the tender of Mr. Louis Monks, Kingston, for the erection of some 47 houses in Brookfield and Booterstown, at a cost of £11,872, this contractor's tender being the lowest. The same contractor's tender for the erection of washhouses at £2,040 was accepted. Messrs. Sanderson and Taylor were accepted as heating contractors at £520.

Canadian architects are invited to send in competitive plans for a public civic library to be erected at the corner of Sherbrooke and Montebello streets, Montreal. The building will cost 250,000dol. Other libraries are to be erected, and it is understood that the plans for the other libraries are to be of similar design. The premiums will be 1,000dol., 800dol., and 500dol. for the three best plans submitted.

The Provincial Public Works Department of British Columbia have awarded to Messrs. Armstrong, Morrison, and Co., Vancouver, the contract for a steel bridge over the Pitt River at Port Coquitlam to connect that municipality with Pitt Meadows. The estimated cost of the bridge will be about 500,000dol., and the work will be completed within twelve months. The bridge will consist of seven open dredging caisson piers and two pile-bearing piers. The approach on the west end will be 300ft. long, and on the east end 463ft.

At the last meeting of the Washington State Chapter of the American Institute of Architects a committee was appointed to devise a form of notification to manufacturers who send out trade catalogues which do not conform to standard sizes, that such catalogues are consigned to the waste-basket. The secretary was instructed to notify the secretary of the American Institute that such action had been taken with the request that he notify the secretary of each chapter concerning it, the suggestion being made that they take similar action.

At the meeting of the Warwick Rural District Council the other day, the sanitary inspector reported that he had received plans from the architect of a syndicate which had purchased 116 acres of land at Strivichall, near Coventry, for the building of 1,200 houses, and laying out the estate with gas and electricity from Coventry; but the rural district council would be asked to lay on the sewer, a length of 2,300 yards. The rateable value of the property would be £20,000. It was decided that the matter be referred to the general purposes committee, together with the question of whether the Housing and Town-Planning Act should not be adopted.

Building Intelligence.

BRISTOL.—The new wing of the General Hospital, which has been built at a cost of £40,000, will be opened on Monday, the 27th inst. Provision is made for a female medical ward, with sun balcony facing south; a maternity ward, with glass-covered sun-balcony, for the reception of the very poor in difficult cases of childbirth, and a new dental department. The maternity ward contains 12 beds, and the female medical ward 25 beds. The building also includes accommodation for resident medical staff, registrar's room, accommodation for lady students, and additional bedrooms for nurses, as well as dining-halls for nurses and the sisters. There is also a new clinical laboratory. The builders are Messrs. W. Cowlin and Sons, of Bristol, and the architects are Messrs. Oatley and Lawrence, of the same city.

DUNBLANE CATHEDRAL.—Another important part of the scheme for the restoration and redecoration of Dunblane Cathedral has just been completed, and will be inspected by their Majesties on their visit to the town to-morrow (Saturday). The cathedral, situated on high ground overlooking the Allan Water, has had a long history. It occupies the site of an older church erected by the Culdees, and was restored or rebuilt by Bishop Clement in 1240. In the 16th century, after a raid by Perth burgesses, the edifice was allowed to fall into disrepair; the roof of the nave collapsed, and for 300 years this part of the cathedral was roofless. The chancel, however, was continuously used as the parish church. It was partially restored in 1870, and shared also in the general restoration of the cathedral, which, under the direction of Sir Rowand Anderson, begun in 1889 and completed in 1893, converted a ruinous building into one of the finest edifices of the kind in Scotland. The cost of that restoration amounted to £30,000. The main features of the present improvements to the choir are the setting back of the organ, the construction of a new organ-case in place of that erected in 1892, the provision of choir-stalls, and the placing of a canopied screen from the floor to the sill of the east-end stained-glass window. The work, which has taken three years in execution, was entrusted to Sir Robert Lorimer, F.R.I.B.A., of Edinburgh. The whole of the new carved work is in native oak. The two new rows of choir-stalls on the north and south sides of the chancel extend eastward from the chancel arch along three bays, a distance of about 41ft., giving accommodation to about sixty men. The upper range of stalls is finished with a canopied treatment. The canopied oak screen across the east wall is a memorial to Bishop Leighton, Bishop of Dunblane from 1662 to 1671, before he removed to Glasgow as archbishop. This screen contains sculptured panels, representing the Seven Acts of Mercy, the groups in which were designed by Mr. Percy Portsmouth, A.R.S.A., of the Edinburgh College of Art. The whole of the carving was executed by Messrs. Clow, Edinburgh. On the south side of the chancel is a range of six lofty lancet windows, with tracery, and these are to be filled with stained glass at the cost of Mr. Younger, K.C., the artist to be employed being Mr. Louis Davis, London.

GLASGOW.—During their Majesties' visit to this city on Tuesday the King opened the Diamond Jubilee block just added to the Royal Infirmary, when the architect, Mr. James Miller, A.R.S.A., F.R.I.B.A., of Blythswood-square, Glasgow, whose design was selected in a limited competition nearly fourteen years ago, was presented to the King. Later in the day the King laid the foundation-stone of the extension of the City Chambers in George-square, now in course of erection at an outlay of nearly £170,000, from designs by Messrs. Watson and Salmon, F.R.I.B.A., of St. Vincent-street, Glasgow, whose design, chosen in competition by the assessor, Dr. (now Sir) John J. Burnet, was illustrated in our issues of May 2 and 9, 1913; Mr. John Watson was presented to the King. His Majesty also

opened the Hospital for Sick Children at Yorkhill, of which Sir J. J. Burnet, R.S.A., F.R.I.B.A. (who was also presented), is the architect.

LAIRA, PLYMOUTH.—The new Church of St. Mary the Virgin at Laira, a suburb of Plymouth, was consecrated by the Bishop of Exeter on Friday. The church, when complete, will accommodate 750, and the portion now erected 450. This comprises two bays of the nave and the north and south aisles, the chancel, Lady-chapel, and organ-chamber and sacristy. The crypt contains a choir, a vestry, and a clergy vestry, with separate approach to the Lady-chapel. When completed there will be a church room below the south aisle. The sedilia of three compartments has been designed in conjunction with a two-light window in the south wall. The nave roof is barrel-vaulted in oak, and the aisle roofs are open-timbered and in oak. The architect is Mr. T. Rodgers Kitsell, A.R.I.B.A., of Portland-square, Plymouth.

LIVERPOOL.—The good progress of the cathedral scheme was a theme of much congratulation at the annual meeting of the general committee held on Monday at the Church House, under the presidency of the bishop. The sum of £37,000 is still needed to pay for the constructional work on the choir and first transept, which will be finished in two years' time. Another year will be required for the internal work of carving, decorating, and furnishing, the greater part of the cost of which is guaranteed, and it is expected that then, in the early part of the summer of 1917, the first portion of the great edifice will be ready for consecration. Gifts in kind are still coming in, those accepted on Monday including four stained-glass memorial windows, ornaments for the holy table, a lectern and gradine, steps to sanctuary, and choir-gates. The annual report of the executive committee stated that as to the choir, the outer walls, the groined interior roof, and the outer roof were all now complete; the tracery of the great east window and the other windows were in position. The chapter-house was also roofed in. Good progress was being made with the erection of the first transept, and the design and execution of the larger stained-glass windows were in hand. There has been raised for general purposes, or the outer shell of the fabric, £324,000, of which there has been spent £270,000. For various special purposes £113,000 has been received, of which there has been expended, roughly, £47,000. It is ten years since King Edward laid the foundation-stone of the edifice.

At Whitley Bay, on Friday, Mr. A. W. Brightmore, Local Government Board inspector, held an inquiry into the application of the Whitley and Monkseaton Urban District Council for sanction to borrow £1,870 for private street-improvements. Mr. A. J. Rousell, the surveyor, submitted plans of the proposed work.

The Cornwall County Council have accepted the resignation as from September 19 of their county surveyor, Mr. A. E. Brookes, who has been appointed to a similar position under the Durham County Council, and have agreed to advertise for a successor at £600 a year, rising by annual increments of £25 to £700.

The Sheffield City Council have before them the recommendation of the improvement committee that application be made to the Local Government Board for sanction to borrow a further sum of £11,553 in connection with the extension of the town-hall. This amount is the estimated cost over and above the original estimate (prepared in May, 1911), and is due to advances in the cost of wages and materials and alterations and improvements decided upon since the original estimate.

An inquiry has been held at the Courts of Justice with reference to a draft special extension order, under the Unemployment Section of the Insurance Act, relating to sawmilling, including machine woodwork. The Commissioner, Mr. A. A. Hudson, K.C., in giving his decision, said he thought he ought to report to the Board of Trade that the Order should not be made, on the ground that it did not extend the provisions of Part II. of the Act to workmen in any trade other than an insured trade, sawmilling being already included in the list of insured trades, for the purposes of the Act, by Section Seven of the Sixth Schedule.

COMPETITIONS.

R.I.B.A. EXAMINATIONS.—The Final: Alternative Problems in Designs are as below:—Subject XVI.: (a) An island on a river, about 240ft. by 100ft., is the site for an Hotel and Tea Gardens. The usual accommodation for a country hotel, together with ample balconies, having suitable outlook, is to be provided. There should be accommodation for housing boats. The general level of the island is 8ft. above the river, which in flood rises 6ft. Drawings required: Block Plan to 1-16in. scale, with other drawings to 1/2in. scale. (b) A Dairy and Farmstead (sixty cows). Drawings required: Plans to 1-16in. scale. Elevations of portions and sections to 1/2in. scale, with 1/4in. scale details. Subject XVII.—(a) Circular Hall for meetings, concerts, etc., to seat 2,000. An organ, and the usual cloakrooms and retiring-rooms, must be provided. The building to be considered as being on a detached site, and the façades to be in stone. Drawings required: 1/2in. scale and a detail to 1/4in. scale. (b) An Elementary Mixed School for 200 children, for a Rural District. The area of the site not limited, but the school is to be designed on the corridor system. A manual-instruction room and a cookery school are to be included. Drawings required: Block plan to 1-32in. scale. Other drawings to 1/2in. scale, and detail through Hall to 1/4in. scale. Subject XVIII.—(a) The Organ-case in the Circular Hall (see Subject XVII., a). The longest pipe to be 32ft. Drawings required: 1/2in. scale, with some details to not less than quarter full size. (b) A Group of Small Dwellings for twelve aged couples, to be considered from a practical point of view. Each dwelling to consist of at least two rooms. A common dining-hall and kitchen offices to be provided. Site having a frontage of 80ft. looking south-east, on the outskirts of a town. Drawings required: 1/2in. scale, and details of different portions to 1/4in. scale.

Dates for Submission of Designs in 1914—1915.

BOLTON - ON - DEARNE HOUSING SCHEME.—The Bolton Urban Council is about to launch out upon a second housing scheme, consisting of 310 houses, or more, at a probable cost of about £70,000. A large plot of land, around which is land so laid out that crowding will not be possible, has been secured, and the council decided, in order to get the best possible schemes, to put the architectural designs out to competition. This was done, and Mr. Charles Hadfield, of Sheffield, was appointed as independent assessor, and made the following awards, which have since been confirmed by the council. First prize, with premium of £50 and appointment, G. F. Pennington, architect, of Carside and Pennington, Pontefract and Castleford; second prize, £50, Matley and Mills, Manchester; third prize, £25, Franklin and Deacon, Luton. Bolton has one of the most successful housing schemes already in operation, and the present proposed scheme will include three classes of house—viz., six-roomed house, with bathroom, etc., four-roomed house, and small-class house. A number of houses with shops are also being erected.

CHICAGO.—Last year, in connection with its Housing Exhibition, the City Club of Chicago held a competition for plans for laying out a typical quarter-section of land in the outskirts of Chicago. Thirty-eight sets of drawings were submitted, the majority of which are now being prepared for publication by the Club. The volume will be ready in the coming autumn. This year the City Club will hold a competition for plans for a neighbourhood centre. The object of the competition is to bring before the public, in graphic form, the practical possibilities of enhancing neighbourhood life in our cities by better, and especially better grouped, buildings and grounds for neighbourhood activities. The drawings submitted in the competition will be shown as the special

feature of an exhibition and a series of conferences on the subject of neighbourhood centres, to be opened at the City Club, Tuesday, February 9, 1915. The club also reserves the right to publish in pamphlet or book form all drawings and theses submitted. This programme for the competition has been prepared with the co-operation of the Illinois Chapter of the American Institute of Architects. One of the past-presidents of the City Club has offered 600dol. for the purposes of the competition, and this amount will be awarded by the jury, as prescribed in paragraph 13, page 4. The preliminary competition is open to all. The competition will be held in two parts, the preliminary and the final. Any individual, group of individuals, firm, or combination between any of these may participate in the preliminary competition. In the preliminary competition each participant will submit one drawing only, a general plan, on the scale of 50ft. to the inch. If, however, a participant desires to show the geographical relation of his proposed centre to its immediate surroundings or to the whole community, he may for that purpose combine a key-plan on a small scale with the main plan of the neighbourhood centre, or may submit such key-plan separately. All persons registered in the competition will be invited to attend a series of meetings at the City Club, the first of which will be held early in July, at which experts on the subject of the competition will speak, and matters connected with the competition will be discussed. Written reports of these meetings will be sent to competitors outside of Chicago. The drawings in the preliminary competition are to be delivered at the office of the City Club, 315, Plymouth-court, Chicago, at or before noon of Monday, November 9, 1914, addressed "Neighbourhood Centre Competition." These drawings will not be made public until the close of the final competition. The drawings in the preliminary competition must not bear the names of their authors, but each must bear a nom de plume. To each drawing, or set of drawings there must be attached an opaque sealed envelope, containing a card bearing the nom de plume and the name and post office address of the author, or of each, if there be several authors. The seals of these envelopes will not be broken, and, therefore, the identity of the authors will remain unknown until the jury has made the awards in the final competition. As soon as practicable after the close of the preliminary competition a jury of five members, to be chosen by a joint committee of the Illinois Chapter of the American Institute of Architects and of the City Club, will select from the plans submitted not less than eight nor more than sixteen which they deem to be the best. The noms de plume of the authors of the winning plans will then be publicly posted in the main lobby of the City Club, and a list of such noms de plume will be mailed to all persons who have registered in the competition. The authors of the plans thus selected shall be eligible to participate in the final competition, and should proceed without further notification with the drawings therefor. The drawings in the final competition are to be delivered at the office of the City Club, 315, Plymouth court, Chicago, at or before noon of Monday, January 25, 1915, addressed "Neighbourhood Centre Competition." Each drawing submitted in the final competition must bear the nom de plume used by the author in the preliminary competition. No further identification of the drawings in the second competition will be necessary. As soon as practicable after the close of the final competition, the jury will award first, second, and third honours to the three sets of drawings which they deem the best among those submitted in the competition. The jury may award honours to more than three if in their judgment special circumstances demand such action. The jury will also select the eight sets of drawings which they deem the best among those submitted in the competition, and the sum of 600dol. will be divided equally among the authors of those eight, to cover in part the expense of preparing the drawings. A set of drawings will comprise a plan submitted in the preliminary competition, and the drawings submitted by the same

author or authors in the final competition. All drawings shall be the property of the authors, subject to the club's right of possession for publication in book form. Inquiries for further information should be addressed in writing to "Neighbourhood Centre Competition," City Club, 315, Plymouth-court, Chicago. The answers will be in writing and will be forwarded, with the questions, to all competitors. Mr. George E. Hooker is the Civic Secretary.

DUDLEY.—The town council of Dudley have decided to invite competitive designs from "qualified" architects practising within 150 miles of the borough for a new town-hall, municipal buildings, and police-station. The designs are to be submitted to an assessor to be appointed on the recommendation of the President of the Royal Institute of British Architects. Three premiums are offered—namely £50, £30, and £20, for the designs which the assessor shall adjudge to be first, second, and third in order of merit, the premium of the author of the design accepted to merge in his commission. The buildings will be erected in sections extending over a course of years, owing to the site being now occupied in part by similar buildings. The work will probably be proceeded with in the following order: Police buildings, municipal buildings, and town-hall. Designs, however, are invited for the whole scheme. All the main frontages will be in Priory-street.

GATESHEAD.—Members and Licentiatees are advised that the conditions of the competition for proposed new school, Sunderland-road, Gateshead, are not in accordance with the R.I.B.A. Regulations for Architectural Competitions, and the competitions committee are in correspondence with the promoters with a view to getting them amended.

HYTHE.—The designs submitted for the Concert Hall and Public Shelter, Hythe, Kent, have been assessed by Mr. C. F. A. Voysey, who was called in by the town council. He has made his award as follows—viz.: First premium, Mr. Arthur Wintle; second premium, Mr. Horace T. Bonner, A.R.I.B.A.; third premium, Mr. W. I. Alcorn. The designs are to be publicly exhibited. The town clerk is Mr. Bernard C. Drake, Town Clerk's Office, Hythe, Kent.

ROME SCHOLARSHIP AND JARVIS STUDENTSHIP IN ARCHITECTURE.—The Royal Commissioners for the Exhibition of 1851 have awarded the Rome Scholarship in Architecture, 1914, to Mr. Philip Dalton Hepworth, on the recommendation of the Faculty of Architecture of the British School at Rome, and on the recommendation of the same body the Royal Institute of British Architects have awarded the Jarvis Studentship to Mr. Ernest Cormier. The Rome Scholarship is of the value of £200 per annum, and is tenable for three years at the British School at Rome. It is open to students of British nationality under thirty years of age. The Jarvis Studentship is offered to the Student or Associate of the Royal Institute of British Architects who is placed next in order of merit to the winner of the Rome Scholarship. The studentship is of the value of £200 per annum, and is tenable at the British School at Rome for two years. Mr. Hepworth, the winner of the Rome Scholarship, is twenty six years of age, and has studied both at the Architectural Association of London and at the Ecole des Beaux Arts, in Paris. He was elected an Associate of the Royal Institute of British Architects in 1912. Mr. Ernest Cormier is a French Canadian. We review the designs on another page. The Faculty of Architecture of the School at Rome has decided that the subject for 1915 in the above examination shall be a "Courts of Justice," on a site 400ft. square, facing a river. The buildings to be flanked by Government offices, connected by open covered ways with the Courts block. There are to be four courts, for civil business, the public access to same being through a large hall; judges and barristers to enter from the back. Four judges' rooms and rooms for barristers, jurors, solicitors, and witnesses, also a Bar library to be provided. Drawings to be sent in to 9, Conduit-

street, not later than noon, January 30, 1915. The Scholarship at Rome is worth £200 a year for three years, and the Jarvis Studentship £200 for two years. The latter is provided by the bequest left to the Royal Institute of British Architects by the late Mr. Henry Jarvis.

Intercommunication.

GUINEAS FOR BEST REPLIES.

We offer a prize of one guinea every week for what we deem the best reply to any query appearing in this column, which we deem worth insertion.

Replies must be sent in over real name and address. No others can receive a prize. The Editor's judgment is final.

This competition is restricted to buyers of the paper, and with each reply a coupon cut from our front page must be enclosed.

Any number of replies can be sent, but a coupon of this date must accompany each.

All else being equal, brief replies will stand the best chance. We emphasise this, as some correspondents ignore the fact that queries want terse facts, not long essays. Any necessary illustrations must be in line only—no tints or washes—and about twice the size they are meant to be reproduced. We are unable to avail ourselves of replies that contain illustrations unless we receive them by first post on Tuesdays.

The right to withhold the prize in the event of no reply being received worthy of it is reserved by the Editor, who also claims the right to publish any other replies he may deem useful.

QUESTIONS.

[13145].—BANANA STORE.—Will some reader, who has had experience of fitting up a banana store, arrangements of hanging fruit, &c., kindly give me a few practical and inexpensive suggestions for same, and oblige—Jamaica.

Mr. W. H. Musselwhite, for the past thirty years surveyor to the Wilton Corporation, has now retired, and is succeeded by Mr. W. R. G. Coles.

The Devon County Council decided on Friday to proceed with the erection of a technical school at Barnstaple at an estimated cost of £30,000.

A new two-tier theatre, to be known as St. Martin's, is to be built in Upper St. Martin's lane, from plans by Mr. G. R. Sprague. It will have a ground area of 6,500 square feet, will seat 750 persons, and will cost about £30,000.

The Lord Provost's Committee of Edinburgh Town Council recommend that no action be taken in connection with a letter from the Edinburgh Architectural Association conveying the desire of that association to be represented directly by a member of the association upon the board of management of the College of Art.

On Saturday afternoon the new miners' hall at Eastington Colliery was formally opened. The building, a hall and institute combined, is close to the main street, and is three stories high, with square tower. The hall has a seating capacity of 1,100. The fabric has cost £5,000, and the furniture £1,000. The contractor was Mr. E. Dyson, of Pelton, and the architect Mr. W. J. Knight, of Eastington.

An inquiry was held by an inspector of the Local Government Board at Boreham Wood on Friday as to the application by the Barnet Rural District Council for authority to raise a loan of £6,000 for the erection of houses for the working classes in Boreham Wood. It is proposed to build twenty-four houses in the first instance to let at rents of 3s. 6d. or 6s. 6d. a week. The district surveyor submitted plans.

The foundation stone of the new parochial buildings of St. Paul's Church, Havelock street, Newcastle-on-Tyne, was laid on Saturday. The buildings are being erected at the east end of the church. There is to be a large hall upstairs, and on the ground floor there are to be reading- and class-rooms. The cost will be £2,500. Mr. Arthur B. Plummer, F.R.I.B.A., is the architect, and the builder is Mr. G. H. Mauchlan also of Newcastle.

A special meeting of Peebles Town Council was held on Thursday evening in last week within the policies of Neilpath Castle for the purpose of formally opening a new reservoir which has been erected on a site granted by the late Earl of Wemyss. The reservoir which has a capacity of 60,000 gallons, and was designed by Mr. S. Cowan, burgh engineer, has been erected, at a cost of £500, as an auxiliary to the Meldon supply.

LEGAL INTELLIGENCE.

WEST-END BUILDING DISPUTE.—In the King's Bench Division, last week, Mr. Justice Shearman heard an action in which Mrs. Louisa Hocker, of 16, Park-lane, W., sought an injunction restraining the defendant, Dr. Douglas A. Shields, of 41, Park-lane, from building at 17, Park-lane, of which he was the tenant, in such a way as to obstruct the light and air of the plaintiff's house, and an order calling upon him to pull down what had been built.—Mr. Charles said Mrs. Hocker held her house under a lease, and it was divided from the defendant's house by Brick-street, which measured 17ft. 6in. at its widest part, and 15ft. 3in. at its narrowest part. The part of the defendant's house facing No. 16 was for a long time hidden by tarpaulin, and for a long time she never suspected that two complete stories were being added to it. But she discovered it in the end, and on May 13 obtained an interim injunction against him; but, in spite of that, the work continued, as it was said that it would not injure the windows at the rear. So the plaintiff on May 14 got the injunction amended, and yet it did not stop the building, the defendant being told by his architect that the work could be finished without interfering with the light and air of No. 16. No. 17 now overtopped No. 16 by 17ft. 9in. Correspondence ensued, and the defendant's answer was that the plaintiff's rooms were darkened by the scaffolding, and that he was going to have the side of his house painted white, which would be much better for the plaintiff. The windows affected were those of the study, pantry, bathroom, and bedrooms—fourteen in all. Mrs. Hocker's son had been obliged to give up the use of the study because it was so dark—in fact, the sky could not be seen at all except by bending down—and in some of the other rooms electric light had to be used except when it was very sunny. It was admitted that the plaintiff was entitled to the light and air, and the defence set up was that it had not been interfered with.—Mr. Pollock said no question of air arose on the pleadings.—Mrs. Hocker gave evidence, and, on her behalf, Mr. Howard Chatterfield Clarke, President of the Surveyors' Institution; Mr. Wm. A. Paul, F.S.I., member of the firm of Messrs. Pilditch; Mr. Havelock Joseph Collins, of the firm of Collins and Collins, surveyors and estate agents, South Audley-street; Mr. Percy J. Waldram, F.S.I., of Buckingham-street, W.C.; and Mr. John B. Thorp, architect and model-maker, who had constructed the model of the plaintiff's house now before the Court, from drawings made by Mr. Lewis.—For the defence evidence was given by George White, head coachman to Mr. Alfred Rothschild; Mr. George Thrale Jell, A.R.I.B.A., of Carlton House, Regent-street; Mr. Howard Martin, past-President of the Surveyors' Institution; Mr. Stephen Chalmers, B.A., an expert on questions of illumination; and Mr. Max Clarke, A.R.I.B.A.—His Lordship gave judgment last Friday morning. His Lordship said he was of the opinion that the additions to the defendant's house had caused substantial interference with the light and air that was admitted to the plaintiff's house, and with its comfortable occupation, and the only question he had to decide was the amount of damages to be awarded. It appeared to him that the true rental value of the house was something like £500 a year. The difference made to it by the additions to the defendant's house he assessed at 10 per cent., or £50, of that rental, and the damage must be estimated at a rental loss of £50 a year for the ten years that the plaintiff's lease had to run. The plaintiff must also have the costs of the action, including the costs of the witnesses and of preparing the model.—Mr. Charles suggested that it would be well to file the plans, so that there might be no mistake, if the question should arise at any time in the future, as to how far the building had gone.—His Lordship said he was assessing the damage for the obstruction by the works already completed, as shown on the defendant's plans. The judgment would be for damages on the basis of £50 a year rental loss, capitalised on the 6 per cent. table—about £700.

ARCHITECTS' ACTION FOR FEES.—In the King's Bench Division, Mr. Justice Bankes heard an action by Messrs. Scott Willey and Webster, architects and surveyors, practising at 161A, Strand, W.C., claiming the sum of £203 18s. for professional services rendered to Harry Robert Wilkinson, of Hotham-road, Putney, and H. W. Lambert, of Holland-road, W., in connection with a scheme for building a picture palace at Fulham. Mr. Lambert denied that they acted for him, and pleaded Mr. Wilkinson had no authority to request them to act for him. Mr. Wilkinson denied that he asked them to incur expenses—that if they did it was conditional upon their raising capital for

the scheme, and that the plans were negligently prepared. Mr. Rowland Thomas appeared for the plaintiffs, Mr. Mulligan for Mr. Wilkinson, and Mr. Tratton for Mr. Lambert.—Mr. Thomas said Mr. Lambert, having obtained the lease of some land at Fulham, applied to Mr. Webster for financial assistance in December, 1912, but did not obtain it. On March 18, 1913, however, he had raised some capital, and, calling at the plaintiffs' offices, gave definite instructions to them to proceed with the plans. He left a rough sketch of the building required, and on June 2 he called at the offices and took the plans away. The connection between the two defendants was shown, said counsel, by a diary kept by Mr. Lambert. From this it appeared that they were seeing each other daily and discussing the picture theatre scheme. There was some difficulty in getting builders to do the work, and the scheme fell through.—Messrs. Scott Willey and F. A. M. Webster gave evidence, stating that they did not agree to accept their fees only after the theatre was opened, or that they would find the capital for the building. The plans were prepared on the instructions Mr. Willey received from Mr. Wilkinson, and the fees charged were on the ordinary R.I.B.A. scale.—Mr. H. R. Wilkinson, one of the defendants, gave evidence that the plaintiffs promised to arrange for the capital for the scheme, and on that understanding they got their instructions to prepare the plans, and agreed to wait until the theatre was open before they would ask for their fees.—The other defendant, Harry William Lambert, said he never understood that he was liable for the plaintiffs' fees, because he believed that Mr. Wilkinson had arranged to obtain the necessary capital before the architects were engaged.—His Lordship said there was clear evidence that the defendants were co-adventurers in the scheme. Mr. Wilkinson got the plaintiffs to act as architects, and they acted, not on the terms he had pleaded, but in the ordinary way. He found that both defendants were equally liable, and awarded judgment to the plaintiffs for the amount claimed, with costs.

IN RE ABRAM KELLETT, OF EALING AND BIRKBECK BUILDING.—An application for an order of discharge has been made to Mr. Registrar Brougham by Abram Kellett, contractor. His unsecured liabilities were estimated at £13,165, and no assets had been disclosed or realised. The bankrupt attributed his failure to loss through an action which he brought against the Stockport Corporation, with whom he had contracted at £300,000 to build a masonry dam, the construction of which was abandoned, to loss incurred in a scheme for building a theatre and a kursaal at Margate, and to depreciation in the value of flats in London. The offences alleged were insufficient assets, contracting debts without the means of paying them, rash and hazardous speculation, and extravagance in living. Mr. Registrar Brougham suspended the discharge for three years.

ARE BUNGALOWS A DANGER TO PUBLIC HEALTH?—WIRRAL R.D.C. v. KERR AND BALL.—Judgment was given in the High Court on Friday by Mr. Justice Lush in the Moreton bungalow case, the trial of which occupied several days at the recent Liverpool Assizes. The action was brought by the Wirral Rural District Council, who sought an injunction to restrain defendants from continuing the bungalows, and from an alleged nuisance and danger to public health. These bungalows were erected without any notice to the council, and without conforming to the by-laws, which, it urged, applied to them as being domestic buildings. They were very small, and cost £15 to £30 to erect, and contained two or three small rooms each. When nineteen had been erected the council called the attention of Farrer to the fact that the by-laws had been contravened; but in the result they permitted the bungalows to remain on an undertaking being given by Farrer to pull them down if the council so required. The lesser proceeded to let out more sites on the same terms, and further tents and bungalows were erected. In his judgment his Lordship held that the bungalows were not a nuisance; no injury to health had been involved, as the bungalows were healthy and fit for occupation during the period for which they were inhabited, and the occupants did not suffer. His Lordship agreed that plaintiffs were well advised in having the matter investigated; but it had been investigated, and the action failed, and he saw no reason for departing from the usual order and saddling the defendants with costs.—Judgment for defendants, with costs, accordingly. The rural council have decided to appeal against this decision.

ARCHITECTS' CLAIM.—M'DONNELL v. O'CONNOR.—At Belfast, last week, Mr. J. M'Donnell, M.R.I.A.I., 27, Chichester-street,

Belfast, sued Mr. John O'Connor, solicitor, Crossmaglen, for £46 8s., for fees at 5 per cent. payable in respect to the building of a house in Crossmaglen. The evidence showed that plaintiff prepared plans for the house, and that the tenders received proved higher than defendant wished to expend, varying from £1,450 to £2,630, and the work was carried out by sub-contractors. Defendant stated that he had told Mr. M'Donnell that he would not spend more than £1,250 on the house, as he was not going to build a house which would cost him £100 a year in rent. Eventually the house was built by sub-contract and direct labour, and the contracts and work with which plaintiff had to do cost £1,215. He alleged carelessness and want of supervision. His Honour, without going into the counterclaim, suggested that defendant should accept a judgment against him for £22 10s. This was agreed to, and judgment was entered accordingly.

SEALE HAYNE COLLEGE CONTRACT.—The award has been given in the arbitration proceedings, conducted on five days in January and February, at the Surveyors' Institution, London, by Mr. John H. Blizard, F.S.I., of Southampton, relative to the claim of Messrs. Pethick Bros., Ltd., contractors, of Plymouth, against the Governors of the Seale Hayne Agricultural College, Newton Abbot, Devon. The claimants, on July 10, 1912, entered into a contract with the governors to erect a new college at Newton Abbot, and agreed to complete, with the exception of the painting, by August 1, 1913, the contract price being £22,000. The governors took possession of the work a short while after the expiry of the contract time, when about £4,000 worth of work had been done, and the contractors claimed £17,000 damages for breach of contract, on the ground that they had been disturbed from their contract illegally. The argument was that the governors had put into force clause 26 of the agreement when they were not empowered to do so, and they complained of unwarranted delays and interference on the part of the governors and officials.—The arbitrator has given his award in favour of the governors, holding they were right in the action they took, and he ordered the claimants to pay the costs of the proceedings.

The name of Mr. J. Thomas Jones, retired architect and surveyor, of Clydach-on-Tawe, has been placed on the Commission of the Peace for Glamorganshire.

Dr. Denison Ross, C.I.E., lately Officer-in-Charge of Records of the Government of India, has been appointed to the staff of the British Museum as Keeper of the Stein collection of Central Asian antiquities.

The air-pollution advisory committee appointed by the city council of Manchester to investigate the smoke nuisance has started an inquiry into the extent of the loss suffered by the people of the city from smoke damage.

The Church of the Sacré Cœur, which constitutes an imposing white mass on the skyline of Montmartre from every part of Paris, is to be consecrated on October 17. It is Byzantine in style, and has been thirty-nine years in building, and has cost £1,600,000 sterling. M. Abadie was the architect.

The foundation-stone of new Y.M.C.A. premises was laid at Yate, Somerset, last week. The hall will be 30ft. by 21ft., and will have a half-timbered roof. The walls are of Pennant stone with Bath-stone facings. The architects are Messrs. La Trobe and Weston, of Bristol, the builders being Messrs. W. J. Powell and Son, of Yate.

The county council of Lancashire have, after prolonged negotiations with the London and North-Western Railway Company, agreed to take over the Sankey Canal bridge on the road between Warrington and Liverpool and reconstruct it. The new structure will be a bascule bridge 40ft. in width, worked electrically, and will be built from plans by the county bridge-master, Mr. Compton Hall. The present structure is on the swing principle, and only 12ft. wide.

At the last meeting of Dumfries Town Council a heated discussion took place with regard to the plans for the additional workmen's houses it is proposed to build. The public health committee recommended that it was impracticable to ask for competitive plans, and that the council should proceed on the plans drawn up by the surveyor. This was in direct antagonism to the open vote of the council at their previous meeting, when they decided to advertise for competitive plans. On a vote being taken, remit was again made to the committee to advertise for competitive plans.

PARLIAMENTARY NOTES.

GOVERNMENT HOUSING BILL. Mr. Runciman, the President of the Board of Agriculture, asked leave on Wednesday to introduce a Bill to give the Board of Agriculture and Fisheries powers with respect to the housing in agricultural districts of persons belonging to the working classes, and to make provision with respect to the housing of persons employed by or on behalf of Government Departments where sufficient dwelling accommodation is not available. He explained that the Bill is not of a highly contentious nature; but there are some directions in which the Departments require power if they are to carry out the declared intention of the Government to proceed with rural housing, not along the lines already authorised by statute, or by depending on private enterprise exercising the powers which the Government think can be properly exercised by the Board of Agriculture, the Local Government Board, and H.M. Board of Works. This Bill is a small measure of some seven clauses. The first clause provides for dealing with rural housing. The Government feel that neither private enterprise, nor the activities of the local authorities, will in any degree meet the pressing case of housing in the country districts. As neither private landowners nor local authorities can provide the houses, the Government have decided that it must be done by the central authority, and so far as the agricultural districts are concerned they have decided to ask for power to the Board of Agriculture to deal with those districts. The other object of the Bill is to provide for the pressing case of Rosyth. Rosyth can best be dealt with by the Government by means either of a public utility company, or, failing that, by a company or association which will be prepared to carry out this work through the Board of Works, and already the necessary practical steps have been set afoot, so that without any unnecessary delay the case of Rosyth may be met and the employees of the Government can be properly housed and have abundance of cottages in which to live. The Government are of opinion that inasmuch as £3,000,000 is to be devoted under this measure for the purposes of rural housing there would be cheap money thereby provided, to be under the control of the Government Department itself, and not of private individuals. It is proposed to provide at least £3,000,000 for the Board of Agriculture and Fisheries for dealing with the rural housing problem, and so far as Rosyth is concerned, a sum not exceeding £2,000,000. The Treasury have undertaken to borrow money by terminable annuities for a term not exceeding thirty years. It is the intention of the Government, while letting the houses on an economic basis, to make the charge nearly approach the actual age of the cottages which the employees will occupy. The motion was agreed to, and the Bill was given a first reading.

A miners' hall was opened at Easington Colliery, Co. Durham, on Saturday. The hall, which has been built by Mr. E. Dyson, of Pelton, from the plans of Mr. W. Knight, of Easington Colliery, has cost about £6,000.

The annual prize-giving and exhibition of works by students in the A.A. School of Architecture will be held on Friday, the 17th inst., at 18, Telford-street, S.W. The awards for the past season and the prizes will be distributed at 2.30 p.m. by Mr. Herbert Baker, F.R.I.B.A., of Johannesburg, Capetown, and Delhi.

A Select Committee of the House of Lords rejected on Monday that portion of the London County Council (Tramways and Improvements) Bill providing for the construction of a double-line of tramway from the terminus at Aldgate through Mansell-street to Tower Hill, and a single loop-line around Trinity-square. A House of Commons Committee had previously passed the scheme. The Committee at their meeting on Tuesday approved the clause of the Bill which authorises the purchase of Nos. 1, 2, and 3, Arlington-street, for widening Piccadilly east of the Ritz Hotel.

It was reported to the Reichlab Corporation that the service reservoir at Boersil is at last approaching completion, and that the cost, which was estimated at £14,000, has exceeded £21,000, in addition to legal charges and the outlay on the site. Considerable and unforeseen difficulties have been encountered. Before the contract for the work was finally given out in the autumn of 1910, one firm after another withdrew their tenders, and in June, 1911, questions arose with the contractor whose tender had been finally accepted as to his obligations. The result was the termination of the contract, and the decision that the manager, Mr. F. H. Brunt, should carry out the work under the consulting engineer, Mr. H. Rofe.

WATER SUPPLY AND SANITARY MATTERS.

YARDLEY WOOD, BIRMINGHAM.—In their report to the Birmingham City Council in March last the water committee stated that they had acquired a site for a balancing reservoir at Highter's Heath, Yardley Wood, at a cost of £1,850 and expenses. The purpose of the reservoir is to provide for the even working of the trunk mains in the system which it will control, such mains comprising not only those at present in course of provision, but also the larger mains towards the source at Frankley, through which the new mains derive their supply. The committee now report that the design for the reservoir has been prepared by the local engineer (Mr. William Gray), and approved by them. The dimensions are 344ft. by 190ft., with a water depth of 10ft., and a total capacity of four million gallons. The estimated cost, including the provision of a keeper's cottage and fencing, is £17,342, and the committee recommend the council to authorise them to advertise for tenders for carrying out the work. The main required to connect the new reservoir with the distribution system comprises a length of 2,928 yards of 30in. cast-iron pipes, the estimated cost of which is £10,912, and this work will be put in hand concurrently with the construction of the reservoir.

The top embattled stage of the fine 15th-century tower of the parish church of St. Mary, Woodbridge, East Suffolk, is now being restored.

A new secondary school for girls, which has been built by the Surrey Education Committee at Guildford at a cost of nearly £18,000, was opened on Wednesday.

Mr. A. E. Smith, surveyor to the Hay Urban District Council, has resigned his position in order to take up a similar appointment under the Petersfield District Council.

At Brierley Hill a Territorial drill-hall built, at an outlay of £1,900, from plans by Mr. C. G. Cowlshaw, of Hanley, has just been opened. The builder was Mr. C. A. Horton, of Brierley Hill.

The Royal Assent was given by Commission on Wednesday to sixty-four measures, including the Port of London Authority Act, the London Electric Railway Act, and the Central London Railway Act.

At the meeting of the Essex County Council held at Chelmsford on Tuesday a general scheme of main road reconstruction, to be carried out in five years, was adopted. The total cost was estimated at £580,057.

Under the efficient supervision of the surveyor to the urban district council of Burgess Hill, Mr. E. Brown, new sewage-disposal works have been installed at the sewage farm in that village at a cost of £1,594.

Mr. Richard Creed, F.R.I.B.A., of Little Bardfield Hall, Essex, and of Verulam Buildings, Gray's Inn, for more than twenty-five years architect-inspector to the Board of Agriculture and Fisheries, who died on May 8, left £14,041.

At a Local Government Board inquiry at Sheffield into an application by the corporation to borrow £19,832 for sewerage works, it was stated that during the last two years the price of pipes had gone up to 50 per cent., labour 10 per cent., and team-work 10 per cent.

The foundation-stone of the new town hall for Marylebone was laid by the Princess Royal on Wednesday. The town hall occupies a site in Marylebone-road, and is being built at an outlay of nearly £100,000, from plans by Mr. Edwin Cooper, F.R.I.B.A., selected in competition, and illustrated in our pages on December 1, 1911, and June 14, 1914.

Drapery and furnishing premises in Devonport have just been reopened after enlargement so as to cover the entire area bounded by Tavistock-street, Market-street, Sidney-street and Cross-street. Mr. G. B. Turpin, of Plymouth, was the builder of the latest extension just completed, and the fittings have been supplied by Messrs. S. Haskings Bros., Ltd. of Old-street, E.C.

During Degree Day proceedings at Manchester University on Saturday the Vice-Chancellor announced that the council had decided upon the erection forthwith of a new building for the Arts Department at an estimated cost of £30,000. We are authoritatively informed, as we are going to press, that the plans for the new department are being prepared by Mr. Percy Scott Worthington, M.A., F.R.I.B.A., of Lombard Chambers, Brown-street, Manchester.

Our Office Table.

At the meeting of the City Corporation yesterday (Thursday) afternoon, the Lord Mayor presiding, Mr. Richard Davies, chairman of the City Lands Committee, again submitted the report of that committee with reference to the Guildhall Improvement scheme prepared by the City Surveyor, Mr. Sydney Perks, F.S.A., F.R.I.B.A., which, as we stated a fortnight ago, was read on the 25th ult., adjourned, and ordered to be printed, with the exception of the plans. Mr. Davies said the committee now asked for authority: (1) To proceed with Section A of the scheme, comprising the block of buildings on the east side of Guildhall Yard (to house the Law Courts, Art Gallery, etc.), at an estimated cost of £68,000; and (2) on completion of Section A, to proceed with Section B, comprising the block of buildings on the west side of Guildhall Yard (Police Court, South Court, etc.), at a cost of £32,000. The adoption of the report was strongly opposed by Mr. John Elkins, chairman of the Corn, Coal, and Finance Committee, chiefly on financial considerations, and in the discussion which ensued he was supported by Messrs. Banister F. Fletcher, Mr. Alphæus C. Morton, M.P., and other architects. The committee's report and recommendations were, however, eventually adopted by a large majority, and authority was given them to proceed with Sections A and B of the scheme.

A North-Western Conference on Arterial Roads in Greater London was held on Friday at the offices of the Local Government Board, Mr. William Regester presiding. A sub-committee reported that replies had been received from twenty authorities, of which nine regarded the roads as inadequate for existing traffic, nine were of the opinion that they were adequate, with certain exceptions, and two regarded them as generally adequate. With two exceptions the authorities agreed that the roads were inadequate for future traffic. There was a general consensus of opinion that the roads proposed by the Traffic Branch of the Board of Trade were desirable, and that the main roads should be wider than was required by the existing by-laws. The sub-committee themselves were of opinion that the existing arterial roads were not adequate for present traffic, and still less for future traffic. The conference adjourned until November 18.

At a meeting of the Cheltenham Town Council on Monday evening consideration was given to the tenders for converting five houses in the Promenade (which have been purchased for £5,500) into municipal offices. The borough surveyor had estimated the work to be carried out for £4,500; but on the specifications (finally prepared by Messrs. Healing and Overbury) the lowest tender was at £7,668 8s. This the sites committee, by striking out various items, reduced to £6,390, and recommended the amended tenders should be accepted, but the chairman (Alderman Margrett) proposed that certain other work should be eliminated, so as to bring the figure down to £5,574. A long discussion followed, in which it was argued that a lift was essential, and if ferro-concrete floors were not provided the scheme would be rejected by the Local Government Board. The mayor moved as an amendment that the tender of £6,390 be accepted.—Alderman Bendall moved a further amendment that only the corridor work be omitted. Both amendments were lost (that moved by the mayor by a majority of one), and Alderman Margrett's proposition for proceeding with so much of the work as could be done for £5,574 was carried. The mayor expressed regret at the decision, and said the council were spoiling the ship for a ha'porth of tar.

A Buff Book just issued by the Board of Agriculture contains the first annual report of the forestry branches recently constituted in the Board of Agriculture and Fisheries and the Office of Works. It shows that, according to the returns of 1913, the total area of woodlands in England and Wales at present is 1,881,100 acres. Over 95 per cent. of this area is privately owned, and it is

stated in the report that it is probably producing not more than one-half of its maximum yield. With regard to the value of the property, it is mentioned that it is not possible to make an accurate estimate; but a conservative estimate would be between 25 and 30 million pounds sterling. Information in the Board's possession shows that there is a very large area in the country which might with advantage be afforested. Steps are proposed to be taken to place the State at relatively small cost in possession of still further information, necessary to decide on the desirability of carrying out a systematic scheme of afforesting the uncultivated land in England and Wales.

Reference is made in the report to a detailed survey made during the summer of 1912, of some 20,000 acres of land on the Birmingham Corporation's Waterworks in the Elan and Claerwen Valleys. The results of this inquiry are interesting, in view of the fact that it has often been assumed that waste land under the 1,500ft. contour-line is all afforestable. It was found that of 12,360 acres under that elevation, 5,990 acres, or 47 per cent., was certainly adapted for economic planting, while a considerable area in addition had to be characterised as doubtful, owing to the absence of any data in the district as to the production capacity of such land.

Mr. Hobhouse, the Postmaster-General, has recently had to place contracts for the supply of upwards of 100,000 wooden poles for telephone wires, in addition to the 65,000 deliverable under the annual contracts placed last autumn for the normal needs of the service. Mr. Hobhouse expresses regret that British forestry has had no share in contributing to this supply. Repeated efforts have been made by the Post Office to encourage British supplies, with very small result. The annual requirements of the Post Office in the matter of wooden poles amount to many thousands; but the yield from British sources has been a few hundreds only. Red fir or Scotch pine and larch are considered the most suitable in respect both of weather-resisting properties and general shapeliness. Both species are easily grown in the United Kingdom, but failure to meet the requirement of length and thickness combined have led to the rejection of much of the British timber offered by growers to the Post Office.

MEETINGS FOR THE ENSUING WEEK.

SATURDAY (TO-MORROW).—Incorporated Clerks of Works Association. Annual Outing by rail and river to Henley-on-Thames and Windsor. Train from Paddington Station 8.50 a.m.

FRIDAY (JULY 17).—Architectural Association. Annual Prize Giving and Exhibition of Work by A.A. Students. Awards for the Past Session Announced, and Prizes Distributed by Herbert Baker, F.R.I.B.A. 2.30 p.m.

SATURDAY (JULY 18).—Edinburgh Annual Excursion to Hamilton Palace, Cuzco Forest, and the Haiging Gardens at Bannockburn.

TRADE NOTES.

Mr. Albert E. Bullock, A.R.I.B.A., architect and surveyor, late of 43, Chancery-lane, W.C., announces his change of address to Brownlow House, 50-51, High Holborn. Telephone Holborn 44.

The directors of the London County and Westminster Bank, Ltd., have declared an interim dividend of 10½ per cent. for the half-year ending June 30. The dividend (10s. 7½d. per share, less Income-tax) will be payable on August 1.

Under the direction of Mr. W. M. Scott, architect, Lindlithgow, the Boyle system of ventilation (natural), embracing Boyle's latest patent "Air-pump" ventilators and air-inlets, has been applied to Blackbrae School.

On Saturday new school premises were opened adjoining Salem United Methodist Church, Sandwell, Bristol. The building is Gothic in style, and is constructed of local Pennant stone with Bath-stone dressings.

A new parochial house three stories in height is to be built in association with City Quay Roman Catholic Church, Dublin, from plans by Messrs. O'Callaghan and Webb. The builder is Mr. James Kiernan, also of Dublin.

Our Illustrations.

VIA DUCT OVER QUEEN VICTORIA STREET, E.C.: THE NEW ST. PAUL'S BRIDGE COMPETITION.

The two perspectives given in further illustration* of the premiated designs represent the proposed approach carried over Queen Victoria-street, with shops below on both sides of that thoroughfare in the abutment buildings. The first drawing is by Mr. Charles E. Barry, A.R.I.B.A., who won the second premium of £200. The pavilions which flank this viaduct contain the public staircases. The second plate shows a view of Mr. Edward R. D. Selway's third (£100) premiated design. In this view St. Paul's Cathedral dome is adroitly and quite fairly introduced, though it is doubtful whether the staircase pavilions gain much advantage or are helped in their relative proportions notwithstanding. Next week we shall give some details of Mr. Selway's obelisk tower, enclosing the staircase from Bankside Embankment.

HOUSE IN AVENUE ROAD, ST. JOHN'S WOOD.

This house is to be built with red-brick facings, orange-red quoins and dressings, including the front porch, painted wood cornice. Roofed with hand-made, sand-faced tiles, and double-hung sash windows. Messrs. Horace Field and Simmons are the architects.

HOUSE IN WILDWOOD RISE, HAMPSTEAD GARDEN SUBURB.

We reproduce the drawing, now at the Royal Academy Exhibition, of this house, which is built with small Dutch hand-made bricks and specially-designed hand-made window-dressings and sills. Hand-made antique roofing-tiles are employed, with swept-circle valleys, bonnet hips, etc. The front porch and bay over is in Chilmark stone. Oak window-frames and front door, iron casements and frames. The external effect is most pleasing and restful. Internally the hall has an open oak gallery and staircase. The general contractors were Messrs. Sabey and Son, of Islington. Messrs. Horace Field, F.R.I.B.A., and Evelyn Simmons, Licentiate R.I.B.A., are the architects.

HOVE PARISH-CHURCH HALL.

This building has been presented fully equipped to the Hove Parish Church by Mrs. Stephen Ralli. It was built as a memorial to her late husband. The walls are of Crowborough stocks, the entrance porch and stonework being in Portland stone. The roofs are covered with stained tiles. The building contractors were Messrs. Chapman, Lowry, and Puttick, Ltd., of Grayshott and Haslemere. The architects are Messrs. Read and MacDonald, of London. The illustration was from a photograph by Mr. E. Pannell, of Hove.

THE NEW SESSIONS HOUSE, NEWINGTON CAUSEWAY.

We give here the principal plan of the New Sessions House, Newington Causeway, for which the tender of Messrs. W. E. Blake and Co., Ltd., of Fulham, was accepted at £108,980 by the London County Council last Tuesday. We gave a view of the main front of the building in our issue of January 30 last. The new Court-house is to have four floors. On the lower ground floor will be the cells and other accommodation for the prisoners, the police common-room, the refreshment room for the public, and large rooms for the storage of records. The ground, or principal, floor will be about 6ft. up from the courtyard. The positions of the chambers has been fixed chiefly by the need for quietude in the courts. The court-rooms, therefore, will be at the back part of the building. In the front part will be the public waiting-hall, entered from the main fore-court through a vestibule. At each end of this hall will be a wide staircase. In the

* Views of all the premiated designs for St. Paul's Bridge were given in our issue for June 26, and general drawings last week, July 3.

well of one will be a public lift. At the back of the hall, small staircases will give access to the public galleries of the criminal courts. Behind the hall will be the three court-rooms; the middle one for civil business, those right and left for criminal cases. To keep out the noise in the public hall there

Union-road. Along this front, too, will be the offices for assessments business, and at the end nearer to the courts, the room for the clerk of the Standing Joint Committee. Here a private staircase and lift will connect the rooms of the Justices with the committee-room on the first floor, and the common and refreshment-rooms on the second floor. The entrance for the Chairman, the Deputy-Chairman, and the Justices will be through a small courtyard at the northern end of the main forecourt, screened off by wrought-iron railings and gates. In a corresponding small

entrance. The lighting is by electricity, produced by a gas-engine and dynamo placed under the stage, with an auxiliary motor-driven dynamo for emergencies. There is also a secondary gas-lighting installation. The ventilation is by means of an electrically-driven fan in the roof, with tubes carried to various points. The heating is by means of gas-heated steam radiators. The theatre is well equipped with fire hydrants and chemical extinguishers and fireproof curtain. The contractors were Messrs. J. G. Green and Sons, Ltd., of Warkworth. The whole has

GROUND PLAN.

LOWER GROUND PLAN.

THE PLAYHOUSE, BERWICK-ON-TWEED.
Mr. S. H. Lawson, Architect.

will be enclosed lobbies into which only those having business in the courts will be allowed to go. Alongside each of the criminal courts will be the rooms for the witnesses and the juries. About them will be corridors leading to the other parts of the building and connecting all with the public hall. By these corridors the chairman, the justices, barristers, and court officials will be able to pass between their rooms and the courts without touching the parts of the building used by the public. Behind the corridor at the back of the courts will be the rooms for the Chairman and Deputy-Chairman of Quarter Sessions, for the Clerk of the Peace, for court officials, and also the library. The rooms will have an outlook over the Council's land. The wing to the right of the public hall will hold the cloakrooms and robing-rooms for the barristers, and another to the left of the hall the Public Office of the Clerk of the Peace. The Justices' cloakrooms will face

courtyard at the southern end will be the entrance for the barristers. Courts Nos. 1 and 2 will be for criminal cases. Each will have a dais, with seats for a bench of twenty magistrates and a chairman, and also the furniture usual for criminal procedure. In these courts there will be seats for a spare jury, and as the number of cases dealt with day by day will be very great, to lessen the time between one case and the next, each dock will have four separate stairways, two for each sex, one "up" and one "down," with doors to shut them off from the court. The positions for the Chairman, witnesses, counsel, and jury have been kept as close together as may be. Court No. 3 is for civil business. There will be no dock, and the furniture will be movable, so as to lend itself to arrangement to suit either licensing or assessment business. On the first floor will be the room for the grand jury, for the grand jury witnesses, and for the common jury in waiting, also a committee-room and several offices. The second floor will be used for the luncheon and common rooms for the justices, barristers, and solicitors, with the necessary kitchens and offices. The quarters for the resident housekeeper will be on the first and second floors, at the S.E. corner of the building. The parts of the building seen from the forecourts and from Union-road will be faced with Portland stone, the remaining parts with stock brick. The pitched roof will be covered with stout grey slates in diminishing courses, the domed roofs of the courtroom with asphalt. For architectural character the aim has been in the direction of breadth and balance. The architect of the building is Mr. W. E. Riley, F.R.I.B.A., Superintending Architect to the L.C.C., who is to be felicitated on the general arrangements, and his best utilisation possible of the opportunities afforded by the site.

THE PLAYHOUSE, BERWICK-ON-TWEED.

This theatre has been erected on a prominent site situated in Sandgate, Berwick-on-Tweed. It is built of freestone, and the elevations are treated with stucco. Seating accommodates 1,040. A good stage is provided, with dressing-rooms and scenery

been carried out from plans prepared by, and under the supervision of, the architect, Mr. S. H. Lawson, Emerson Chambers, Blackett-street, Newcastle-on-Tyne, for Messrs. Pictoreland (Berwick), Ltd.

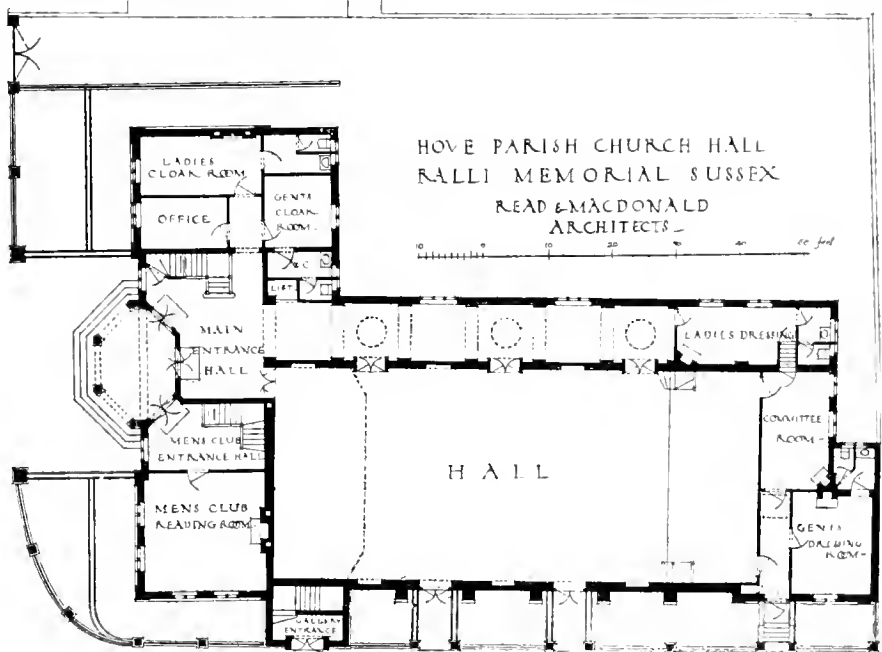

The town council of Oswestry decided on Monday to increase the salary of their borough surveyor from £250 to £300 a year.

At the annual meeting of the New York Society of Architects the following officers were elected:—Mr. Constantine Schubert, president; Mr. J. Riely Gordon, vice-president; Mr. William T. Townner, secretary; and Mr. Louis Berger, treasurer.

The rapid increase in the consumption of water in Birmingham has compelled the water committee to recommend the city council to authorise the construction of a third pipe-line from the Elan Valley to Frankley Reservoir at a probable cost of £700,000, as proposed in a report by Mr. Henry Rofe, M.I.C.E., and endorsed by Messrs. Willeox and Raikes, of Temple row, Birmingham. The water committee recommend that the preparation of the designs and estimates be entrusted to Mr. F. W. Macaulay, at present the Elan resident engineer.

An Imperial Hotel is about to be built at St. John, New Brunswick, at an estimated cost of a million dollars. The plans—which have been prepared by Messrs. Ross and MacDonald, architects, Montreal, who designed the Chateau Laurier, Ottawa, and the Fort Garry, Winnipeg—provide for more than 200 bedrooms, 125 of which will have private bath. The building will be six stories in height, fireproof in construction, and will stand on 30,000 square feet of land on the corner of King-square and Sydney-street, facing on King-square.

New memorial reredos and panelling have recently been dedicated at Staplefield Church. The reredos is divided into three bays, the central being the largest. On a moulded gradine stands the altar cross. The canopy over has a pierced tracery head, with a carved cornice, eusting, and pinnacles. The side canopies are treated somewhat similarly. In the niches are statues of adoring angels. The panelling, which, together with the reredos, extends the full width of the chancel is also of oak; but the detail has been kept somewhat subdued. The work has been executed and fixed in situation by Messrs. Harry Hems and Sons, of Exeter.

THE PLAYHOUSE, BERWICK-ON-TWEED.—Mr. S. H. LAWSON, Architect.

"CROW CLUMP," WEYBRIDGE.

This house is being erected for Mr. T. P. Latham on Crow Clump Hill, overlooking St. George's Hill Golf Links at Weybridge. The walls are to be of grey stock bricks and Bargate stone. The whole of the woodwork is to be of English oak, left its natural colour. The roofs are to be covered with hand-made rough sand-faced tiles of dark colour. The house is planned to get as much view as possible both to the south and the west and at the same time to conceal the servants' yard; it has been dug out of the side of the hill, and enclosed with a high brick wall, as shown by the accompanying plans. The interiors of the drawing room and bedrooms will be finished in white

enamel, the dining-room in mahogany, the billiard room, hall, study, and landings in English oak. Mr. W. G. Tarrant, of Byfleet, Surrey, is the contractor. Messrs. Tubbs, Messer, and Poulter, Craig's Court House, Whitehall, are the architects.

Mr. Robert Kerle, of Oakwood-court, Kensington, formerly of Clarefield, Sunningdale, architect, who died on May 26, left £26,005.

Mr. Francis Ireson, of Wellingborough, builder, who died on May 13 last, left estate of the gross value of £11,268 11s. 10d., of which £914 13s. 10d. is net personalty. Probate of his will has been granted to his sons, Mr. Frank Herbert Ireson, music dealer, and Mr. Charles Arthur Ireson, builder, both of Wellingborough.

The county council of Cardiff are about to widen and strengthen the bridge over the feeder between Bridge-street and Guildford-street, and to reduce the sharpness of the road approaches to the bridge. The improvement is estimated to cost £1,725.

The erection at Falmouth of the corporation cottages behind Berkeley Vale is rapidly progressing, and the first half, twenty-two in number, are nearly all finished and occupied. The houses were designed by the late borough surveyor, Mr. Walters.

The Darent Valley swimming-bath was opened on Wednesday week by Earl Stanhope. The bath, which is situated at Brasted, is 75ft. long, 50ft. wide, and the depth of water varies from 2ft. 6in. to 7ft. The total area of water is approximately 3,750 square feet.

SOME HINTS TO YOUNG ARCHITECTS.

In the early days of an architect's career he is not infrequently pulled up short by his client with the question, "What will it cost?"—referring, of course, to the design, which, after many days' consideration, is now ready for the builder's hands. To answer this question to the satisfaction of an outsider would demand a thorough acquaintance on the part of the architect with the value of the labour and materials involved in all the building trades; but by some behind the scenes such knowledge is deemed wholly unnecessary, and the information is arrived at by the ready and convenient way known as "cubing." It is well to note at the outset that this method is not applicable to alterations, repairs, or restorations of any kind. When it is desired to know the cost of these, application must be made to a practical man. We have said that cubing is ready and convenient—first, because it can be promptly applied, the calculations involved being few; and, secondly, because the subtraction of a penny or two per cube foot will often bring the estimate within the required limits, and so satisfy the architect and client—for the time—although the prescribed limits may be considerably exceeded in carrying out the work.

There still evidently survives a fond belief that the architect's estimate must be the actual value of the work, for no otherwise can one account for the publication of the amount of the architect's estimate with a long list of tenders. Every tender must be an approximate estimate of the work to be done, and that which is nearest the actual value of the work is necessarily that prepared by a practical man who is acquainted not only with the value of building-work in general, but also with that of the locality in which the proposed building is to be erected. Some architects write rather sharp specifications, and they keep the contractors up to their provisions. Some specifications are slipshod, the architect being stronger in art than in building-construction. Contractors soon get to know these facts, and this knowledge influences their tenders accordingly. Builders, again, have varying moods when doing their work. Some are given to interpret the drawings and specifications generously, while others appear incapable of understanding the plain English of the specification clauses, and they always take them to mean something much easier of execution than was intended. It is as great a pleasure for an architect to have to deal with one of

these kinds of contractors as it is a misery to wrestle with the other.

Quantities often produce "wild" estimates, though they are supposed to eliminate all uncertainty as to what amount of work will be required, and its quality; and this arises from the elaboration of the labours in every item. Some tender on all the minute details of every piece of work, while others neglect them, pricing only the backbone, as it were, of each item. Again, the quantities may be taken "full" or "slack." If the former, anyone tendering, and "in the know," will, of course, have an advantage over those unskilled in such things.

Having got over his first estimating, the architect's next difficulty will be in issuing his certificate for payments on account. This certainly demands some knowledge of the price of work, for the contract provides that the amount shall be a certain percentage on the value of the work done. But even in these cases certificates may be issued without any strict relation to the actual value thereof—at the beginning, at any rate; but towards the close the pinch is felt, and the architect must walk warily as the work is coming to a finish. Where an alteration is made in the work contracted for, the architect is supposed to estimate its value, and add to or deduct from the contract sum accordingly. But as the contractor has a vital interest in such changes, the architect is not likely to be left very long without some idea being obtained of what the builder values the change at. In our practice we found it difficult to get the contractor, in some cases, to say what the "extra" was worth, while in other instances the cost of the proposed change was stated at once. We would advise the architect to get an estimate at once of any such alteration and submit it to his client. The client's approval should be communicated in writing to the builder, and in this way, as the work proceeds, any additional cost will become part of the contract, and nothing will be left hanging over to the end unsettled—a plan which satisfies nobody but the builder, and very often loses a client to the architect.

Where an architect has an extensive practice he can employ a surveyor, and that gentleman, having all building prices at his fingers' ends, can arrange the preliminary estimates, certificates, and the cost of all extras, without trouble to the architect. This system is favoured by architects whose artistic instincts are incompatible with a knowledge of practical building or prices. It is obvious that where an architect values extra work he

must have quantities to attach his prices to, hence his practice must include surveying, or he must employ a surveyor to do this special work for him, or engage a surveyor as one of his clerks. When a builder tenders on quantities, the surveyor may decline responsibility for them after the contract is signed. But whether he does or does not, no one ever thinks of measuring up the finished building, with a view to finding whether full value has been rendered by the contractor. Generally speaking, the client knows nothing of the surveyor—not even that he pays him—for his charge is included in the builder's tender, and the builder pays him, leaving a very interesting conundrum to be solved, "Who is the surveyor's employer?" for the architect engages him, but accepts no responsibility for payment; the client is not aware of all the circumstances, and never meets the surveyor; and the builder hands over the employer's money to one he knew nothing about until he got the quantities. The practice as regards the employment of the surveyor is in many cases quite above board, especially with public bodies; but there is too much reason to fear that the employer is not always informed what the surveyor's charge will be, or that the contractor is the medium through which he is paid. Indeed, it is certain that the client would object to pay what is really an additional 2 per cent. on the architect's fee.

Suppose the architect does his own surveying, when does he learn how? In the course of his apprenticeship he is probably fully occupied in making drawings, with an occasional visits to works in progress. Moreover, the architect does not profess to teach surveying. Take timber, for instance—a material so extensively used in every building. Where does an architect gain that knowledge of its value which is necessary to enable him to arbitrate between the employer and the builder in the case of disputed accounts? Unless he is carrying on the work without a contractor, and buys the material himself, he can have no idea of the actual value of brick, stone, or timber. It is comparatively easy to remember what a thousand of bricks is worth, or a cube foot of stone; it is not so easy to arrive at the value of the timber used in the various details of carpentry and joinery; yet this knowledge is, after all, that of most importance to the young architect, and the most difficult to obtain. To make this plain, if an inquiry is made of a quarryman what per foot his stone is worth, there is usually only one quality, and one price, so that the reply is definite. But if a similar question is addressed to a timber-merchant, the reply will neces-

sarily be vague because there are so many different qualities of the same wood, and the information will be of little value.

We referred above to the possibility of an architect dispensing with a contractor, and carrying out his work with, say, a clever foreman. In this case, all the money for wages and materials will pass through the architect's hands; but, after a lengthened experience of this method, we cannot recommend it, and we strongly advise the architect to decline all money dealings if he wishes to maintain his independence and the respect of his client. We have taken a client to a timber-merchant's, and, in his presence, bargained for what was necessary, the client paying there and then the amount of the account, everything being above board; but, years after, we heard that a slanderer suggested there was a private understanding in the case, and he was believed. In another case, we selected some gunmetal and brass-work in the presence of a client, and when the account was made out to us, showing plainly the discount, we handed it to the client, who discharged it with his cheque. But he was never satisfied that there was not some secret understanding between the merchant and ourselves giving us a further discount or commission. For years we have resolutely refused to purchase grates, locks, or fittings of any kind that may be required in our buildings. Such a duty is the contractor's, and the profits of it should be left to him. It is no part of an architect's duty to turn tradesman.

Let us now try to give, in a familiar and attractive manner, as much information about the measurement and valuation of woodwork as will enable the architect to be his own surveyor in this trade, and to value any timber that he may have to deal with. First, then, it is necessary to recollect that timber in planks, deals, battens, and other rough-sawn sizes are always sold wholesale by the "standard" hundred of 120 pieces 6ft. long, 11in. by 3in., or, what is the same thing, 120 pieces 12ft. long, 11in. by 1½in.; so that in this standard there are 185 cubic feet. It will be noticed that we have written "this" standard—a distinction which is necessary, for there are other standards in various parts; but this one, known as the "St. Petersburg standard," is that used at all the wholesale timber sales in London. This is a large standard of measure compared with most used in the building trade, if we exclude the rod; but it is never brought into bills of quantities, though the builder generally purchases his foreign-sawn rafters and joists by the standard from the timber merchant. The architect will naturally want to know what is the value of timber per cube foot, for it is by this standard builders' estimates are priced and additional works measured. A little mental calculation will, however, enable him to know what the price per standard is when he knows that of the cube foot. Take, for instance, a standard of 3rd St. Petersburg deals 11ft. by 3in., sold at £13 10s. It is evident that as there are 185ft. in the standard, if the deals were sold at £9 5s. they would be worth 1s. per cube foot; but as they fetched £13 10s., or once and a half as much, the value per cubic foot would be, roughly speaking, 1s. 6d. per foot. Suppose, again, that the builder purchases a standard of 4in. by 2in. "unsorted yellow" at its present price—£10 15s. to £11—what does it cost per cube foot? At 1s., the standard would have been £9 5s.; but an addition must be made for the excess, £1 5s., and this is easily done when it is recollected that every penny added to the price per cube foot adds 15s. 5d. to the price per standard. Leaving builders' price-books aside for the present, and taking the whole-

sale trade in timber, what are the present prices of building timber in that trade? Knowing these, the architect will know what profits are charged on the woodwork by the time it reaches his bill of extras. The following prices are all at per standard, as explained above, so that this need not be repeated, except when it is stated to be otherwise. Archangel deals are favourites for joiners' work; they are worth £18 for first quality yellow, or about 2s. per cube foot. Canadian yellow pine, first quality dry, is worth wholesale £30, or 3s. 3d. per cube foot. The architect recognises this timber in his drawing-boards. It is now the dearest soft wood in the market, and is very little used in building on account of its cost, although it was commonly used for door-panels fifty years ago. Oregon pine, 8in. by 4in., prime unsorted quality, is worth £15, or 1s. 7d. per cube foot. Spruce, 9in. by 3in., first quality, is worth £15, so that, at present, its value is the same as that of Oregon pine. Pitch pine, prime quality, 11in. by 2in., sells for £12 10s., or 1s. 2½d. per cube foot; in the log it sells for from 1s. 3d. to 1s. 9d., the price depending on the length and dimension of the stick. Logs 40ft. to 45ft. long, and from 16in. to 18in. square, carry the higher price, while logs about 24ft. long and from 10in. to 11in. square are sold for the lower price.

THE LONDON MEMORIAL TO CAPTAIN SCOTT.

The models submitted by the six invited sculptors for the monument to Captain Scott and his four comrades, who lost their lives in the South Polar Expedition, have been on view this week in the partly-finished structural laboratory of the Imperial College of Science, South Kensington, which Sir Aston Webb is erecting in Prince Consort-road. The site has apparently not yet been chosen, or even defined, if we may judge from the varied treatment illustrated by the proposals thus displayed, some evidently being intended as the finish for the vista of an avenue, others for a recess or alcove by the side of a roadway, and some designed as the centrepiece of an open Place. The designs, therefore, are scarcely comparable, and the selection committee seems to have had some difficulty in arriving at a decision, although they were advised by Sir Thomas Brock, R.A. The members are: The Hon. Harry Lawson, M.P., The Right Hon. Sir Edgar Speyer, and Mr. Lionel Earle, Secretary H.M. Office of Works. We have no doubt as to the fitness of the choice which has been unanimously made in favour of the scheme marked by the motto, "Pro Patria," the author of which is Mr. Albert H. Hodge, 50, Bedford-gardens, Campden-hill, W. All the models were set out to the scale of two inches to the foot, and it is curious to note how greatly diverse the size of these monuments really are as seen in this gallery.

THE SELECTED DESIGN.

Mr. Hodge has reckoned that the monument will occupy a central position in an open square, and its own enclosure, comprising a raised platform of considerable area, has big, massive posts and chains at the four angles. The height of the memorial will be a little short of 40ft. It takes the form of a corniced pylon, built of granite, standing on a richly detailed podium, the whole being surmounted by a bronze group, illustrating a winged heroic figure of "Patriotism" sustaining "Courage" dressed as an Arctic explorer, and both standing on the spurred and set-underfoot representations of "Fear," "Death," and "Despair," while "Courage," as the pioneer, is crowned by "Im-

mortality." Inscriptions below read: "For King," "For Country," "For Brotherly Love," and "For Knowledge." The front of the pylon bears the names of Captain Scott, Dr. Wilson, Lieut. Bowers, Captain Oates, and Petty Officer Evans, each of these heroes being represented by medallions in bronze, linked annuletwise by a broad band of conventional laurel leaves above the moulded base of the superstructure, well done in bronze. A trophy on the rear is formed of a replica of the cross erected on "Observation Hill," a wreath, and a pair of snow-shoes. Captain Scott's memorable words are written below: "Had I lived, I should have had a tale to tell of the hardihood, endurance, and courage of my companions which would have stirred the heart of every Englishman."

Each of the four sides of the podium contains a bronze relief, illustrating "To Strive," "To Seek," "To Find," "And Not to Yield." This latter panel depicts the snow-covered tent—the heroes' last resting-place. No undue prominence is given to Captain Scott, though it no doubt will generally be taken that the figure of "Courage," which stands so prominently on the summit with his uplifted hand is intended to personate him in front of the emblematical figure of "Patriotism," holding up the crown of "Immortality."

THE OTHER DESIGNS.

Following the order of the numbering in the exhibition, we may briefly remark upon the other designs. No. 1, marked "Under the Star," is said to be by Mr. T. Stirling Lee, who has poetically aimed at the ideal of a snow-clad mountain with the dark bronze group of the five heroes on the top of a "bleached Portland stone" rock, at the circular base of which on the diagonal points are seated stone figures representing "Human Love," "Strength," "Truth," and "Science." The memorial tablet in front of the promontory seems too casual, or almost accidental in effect, and rounded forms suggested by snow are employed with a sense of size, though the scheme is one of the smallest submitted. The design of the group seems wanting in a frontal inasmuch as Captain Scott, the chief personage, is represented looking back over his shoulder, and the idea of "bleached" masonry for a monument in London would certainly not be realised in the murky atmosphere of the Metropolis. The cost is set down at £7,500 in the accompanying estimate.

No. 2, in bronze and grey granite, we were informed, was designed by Mr. Arthur G. Walker. The excellently-modelled bronze figures of "the five worthies" are intended to be rather larger than life size, and they are exceedingly well grouped; but, being placed on a shelf, so to speak, they do not intrinsically belong to the structure, and, in fact, this effect is encouraged by their being movable in the model. The central trio are standing, the pair at the sides are seated. Britannia, of heroic size, surmounts the pylon, and vases, right and left, top the ramping wings which end in bronze-panelled pedestals at the extremities, and each of them is finished, carrying a sea-lion, while the curved frontispiece of the podium is nicely terminated by these twin pedestals. Apart from this criticism, which we have suggested as weighing with the judges, no doubt the composition is both dignified and well conceived as a design adapted to be recessed by the flank of a sideway, or set in a park recessional space.

No. 3, by Mr. S. Nicholson Babb, is distinguished by a capitolly-modelled group at the base of the segmental-fronted obelisk

or pylon, finished off with a cornice and frieze, carrying a composition or trophy consisting of a wreath, and globe and flags. On the return faces of the podium the flattened prows of decorative boats project slightly in a hesitating way. The raking heads' line from right to left, formed by the figure group, is very unhappy in effect, though there is no doubt as to the unification of the arrangement of the statuary with the structure. A standing figure of a man with a horse and dog occurs to the left, and on the right hand a figure is seated at the end of a sleigh, while Captain Scott in the midst is pointing forward with undaunted fearlessness. The inscription panel is in front of the pedestal of the piece which has a moulded base and plinth of bold proportions standing on a pair of shaped steps having but an incidental relation to the whole.

Mr. Derwent Wood, we were told, is the author of No. 5, which in large letters bears as a frontal the words, "To strive, to seek, and not to yield," along the top of the podium. The structure of this proposal is very massive, and quite unlike the winning design, though it found favour, it is said, with some of the assessors. It has rusticated sides which, after the fashion of an obelisk, taper towards the top, where a broad platform is furnished by a colossal globe encircled by the equatorial band or zodiacal girdle. The entire conception is somewhat strong:—

"What though in solemn silence all
Move round this dark terrestrial ball."

The sphere rests upon a flamboyant stand garnished with flags, which follow on in scale as a striking trophy. The cornice is too big and coarse; quite out of harmony with the rusticated masonry, which again accords badly with the jointing shown at the rear of this squat pylon. Indeed, the structural joints do not even run through in a line with these rustications, and the scale of the inscription panels, 9ft. to 12ft. high, emphasise the smallness of this puny quoin work. The modelling of the figures of Scott, Wilson, Bowers, Oates, and Evans is extremely good, and their composition is quite one of the best. Architecturally the design is indifferent and lacking in study.

No. 6, marked "Credo nella Eperenza," is an Italian design, to be carried out in red granite and gilt bronze; but the style is somewhat an imitation of the Victoria Memorial, and yet it looks toylike in scale. The seated figures of "Navigation" and "Science" flanking the pylon being too compressed into their chairs, which are part of the structure, and the heads of these figures seem much too big in profile. On the top is an heroic figure of winged "Fame," urging on a boy who carries a model of a boat in his left hand. This group is very pleasingly managed, but the medallion of Captain Scott is very out of scale and poor.

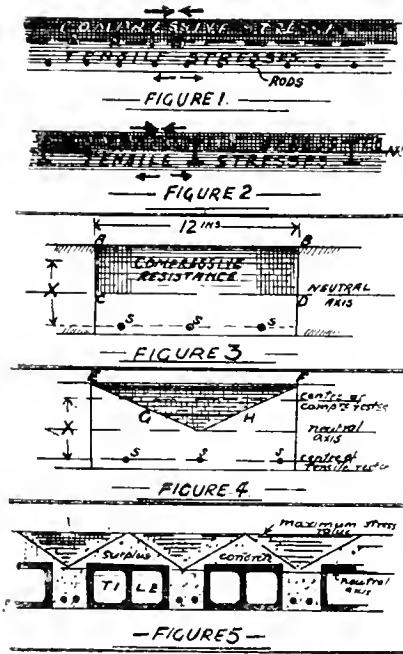

THE PRACTICAL APPLICATION OF REINFORCED - CONCRETE CONSTRUCTION.

By WM. G. SHIPWRIGHT,

Licentiate R.I.B.A., M.C.I., and Chartered Surveyor (by Exam.)

Many previous articles on reinforced-concrete buildings in this paper have clearly indicated its scope. Of course, the design of any form of construction plays an important part in determining its ultimate efficiency, cost, and the facility with which it can be applied; but very few practitioners realise how very extensive is the difference in the cost of well- or badly-designed reinforced-concrete construction, and exactly where the prime causes of this difference are to be found. The most reliable comparison is effected by placing side by side

various forms of reinforced concrete constructed with rods, to resist the tension stresses, whilst the concrete affords the compressive resistance, and the ordinary steel joist and concrete construction, wherein both steel and concrete resist both compressive and tensile forces. The comparison can be readily appreciated by reference to the diagram (Figs. 1 and 2), which shows an

essential difference between the two types which is not always fully appreciated.

Having regard to the fact that concrete is not prima facie a material adapted to the resistance of tensile stresses, the old type of steel and concrete floor shown in Fig. 2 does not commend itself on a scientific basis, and indicates that some considerable wastage must occur in securing concrete bays of sufficient strength to resist the tensile forces, the axis, in fact, coming much nearer the upper (compressed) surface when the slab adapts itself to provide equality in the moments of resistance, in

much the same manner as the axis in the old-type cast-iron girder came much nearer the centre of the compression resistance, unless the girder was specially designed to provide a much greater area of metal in the tension resistance. A comparison of the cast-iron girder, with its unequal resistance to the steel, with equal resistance and consequent saving in material, being an applicable analogy to the resultant wastage which must occur in the construction of a floor where no provision is made to assist the tensile resistance of the concrete. Therefore, from a scientific aspect, a floor which is designed in

such a manner that the concrete takes up the compressive stress and steel the tensile stress, is obviously of more scientific value in its main principle of design, by allocating to each material the resistance of which it is most capable, and should, other things being equal, show a consequent saving in the cost of construction. As a matter of fact, this hypothesis can be demonstrated to be a fact, the actual saving really occurring in the steel, owing to the fact that concrete slabs of equal thickness may be used to better advantage and much greater span than is possible under the older type of construction. Hence, with a normal thickness of concrete the percentage of steel in the older form is much higher than in the modern.

The essential principles governing reinforced-concrete floor construction may be summarised in the illustration given in Fig. 3, which may be assumed to be a section 12in. wide across a reinforced concrete slab floor; the assumption, for the purposes of calculation, being that the resistance moment is secured by a couple of forces represented respectively by the rods S, below the axis, and the area of the concrete, A, B, C, D, above the axis-line. The former resists the compressive forces, the latter the tensile, and the lever arm of these resistances, X, extends between the two respective centres of pressure, the tensile in the centre of the rods and the compressional two-thirds the height of section A, B, C, D. This latter result arises from the fact that the maximum compressive stress at the upper edge, AB, steadily declines to nil at CD, and the amount of pressure in each particular layer of fibres may be expressed as a proportion of the maximum stress at the outside edge, diagrammatically, as shown in Fig. 4. The amount of the stress at GH, in comparison to the allowable maximum, being, in fact, equal to the length of GH in comparison to EF.

The centre of this total value of resistance is two-thirds its height, from which it follows that the forces required to resist fracture by bending are the triangle of concrete and the rods shown in Fig. 4, in which an equal stress would occur in every part of the concrete. It will, therefore, be seen that the form shown in Fig. 5, which is an outline of the hollow tube floor, when properly designed, has an equal strength with a solid concrete floor of the same thickness, and is at the same time lighter and possesses better sound- and fire-resisting qualities. The reduction in weight alone is, it should be noted, an added strength, probably amounting to 20lb. or 30lb. per foot super. Hence it is clear that the hollow tube reinforced concrete represents the most scientific form of floor construction at present in vogue—a possible defect from thoroughly fire-resisting construction is the strip of concrete between the tile-blocks, the concrete being a comparatively poor fire-resisting medium compared with the tile. In this respect the steel joist, tile, and concrete floor undoubtedly must be given precedence, as it provides a complete ceiling surface of fire-resisting tile—a result which has not been adequately secured in any system of reinforced concrete floor construction so far evolved.

A great amount of wastage in metal may be caused by uneconomic design, which provides greatly differing tensile and compressive resistances. Reinforced concrete is designed on the accepted basis that steel possesses an elastic resistance from eight to fifteen times greater than concrete, graded in the following proportions:—

Cement.	Sand.	Coarse material.	Comparative elastic resistance of steel to concrete (or modular ratio).
1	2	1	15
1	1	3	11
1	1	2	8

Hence the stress in the steel rods in a floor is fifteen times greater than in the concrete of the usual proportions of 4:2 and 1, that is to say, the axis is determined in a floor, taking a 12in. section, by 15 x area of metal in section by $d - x = \text{area in compression} (A, B, C, D \times X)$ or $15 a (d - x) = \frac{1}{2} a c^2 \times X$ (Fig. 6).

A few test calculations will serve to show how wastage may occur, and it will be seen after further investigating the process of calculation, that the area of metal which

produces an equal tensile and compressive resistance equals about .006 of the concrete area, as in the case of the floor shown in Fig. 8, wherein two 3/4 in. rods = .2 x 2 = .4 in. Concrete 12 in. x 5 in. = 60 in. Therefore, metal area

$$= \frac{.4}{60} = .006 \text{ of the concrete area.}$$

For the purpose of drawing an analogy between design and cost for different types of reinforced floors, the examples shown in Figs. 6, 7, and 8 are selected. The particulars of these floors are:

Fig. 7:—

$$\text{Ratio of steel and concrete} = \frac{1.76}{48} = .036.$$

Position of axis "X" = 2.56 in. from top edge. Resistance (comp.) 190 lb. per ft. (over 10ft. spans).

Resistance (tension) 600 lb. per ft. (over 10ft. spans).

Fig. 8:—

$$\text{Ratio steel and concrete} = \frac{.4}{60} = .006.$$

Position of axis "X" = 1.7 in. from top edge.

SCALE DIAGRAM SHOWING—CUBIC YARDS OF CONCRETE—LBS. OF METAL—TOTAL SAFE LOAD IN LBS.—6 FT. SQ. BAYS—10 FT. SPAN FLOORS. ALL TO SAME SCALE, FOR FLOORS SHOWN IN FIGURES 7, 8 & 9

SCALE SHOWING ACTUAL COST OF MATERIALS IN A 6 FT SQ BAY OF FLOORING (10 FT SPAN) AND THE EQUIVALENT COST FOR EVERY 100 LBS PER SQ FOOT RESISTANCE OBTAINED IN EACH TYPE

Resistance (comp.) = 180 lb. per ft. (over 10ft. spans). Resistance (tension) = 190 lb. per ft. (over 10ft. spans).

Fig. 9:—

$$\text{Ratio of steel and concrete} = \frac{.6}{72} = .0083.$$

Position of axis 2.3 in. from top edge. Resistance (compression) 290 lb. per ft. (over 10ft. span).

Resistance (tension) 350 lb. per ft. (over 10ft. span).

An estimate of the relative cost of these different types of floor is shown in the diagram, Figs. 10, 11, and 12, the concrete and steel being shown by differently hatched areas.

The concrete is shown to scale in cubic feet of material taken up in laying a bay 6 ft. square, and the steel is shown in pounds weight for similar area. This diagram affords a clear indication how wastage of material may occur when the relative strength of the floors are compared.

Assuming that the cost of the concrete is 15s. per yard, the steel 9 6s. 8d. per ton (14. per lb.), the diagram in Fig. 13 shows to scale the relative cost of the materials in shillings for each 6 ft. square bay, and also the cost per 100 lb. per foot super. resistance secured, this latter being an equivalent economic basis, and, therefore, the actual value obtained in each case. From this it will be seen that in the floors, with the more equal tension and compression resistances, far better value is obtained for the outlay, and that the 4 in. floor would cost just double

the 5 in. in order to obtain almost identical resistance—viz., 180 lb. and 190 lb. per foot super. This is, of course, omitting the cost of the centering and labour, which will be approximately equal in all cases.

If the floors are constructed upon what is known as the continuous principle, illustrated

in Figs. 14 and 15, wherein it will be seen that the negative tension stresses occurring above the supporting beams are resisted by tension-rods, the floor becomes partly a cantilever on either side of the supports and partly a beam in the centre of the span. The allowance made for this type of floor is one-quarter greater loading as regards the maximum moments occurring above the supports and one-half greater loading as regards the maximum moment in the centre of the span; hence it becomes a question of cost in a floor as to whether it is desirable to make the floor uniform throughout, or to increase the metal 20 per cent. over the support only. On the basis of the previous figures the floors constructed uniformly throughout will respectively carry—

- 4" with four 3/4 in. rods per foot—
190 + (4 x 190) = 240 cwt. per ft.
- 5" with two 3/4 in. rods per foot—
180 + (2 x 180) = 225 " "
- 6" with three 3/4 in. rods per foot—
290 + (3 x 290) = 360 " "

Assuming the lower rods are carried through—

SCALE DIAGRAM—SHOWING COMPARATIVE COST OF MATERIAL IN 6 FT SQ BAY OF FLOOR OF THE CONTINUOUS 3 INCH CONTINUOUS TYPE

SCALE SHOWING THE EQUIVALENT COST FOR EACH 100 LBS (PER FT. SUP.) RESISTANCE OBTAINED IN EACH TYPE—OR THE RELATIVE ECONOMIC VALUE

out the span between supports, in order to secure continuity in the construction, the comparative actual cost in relation to the previous example of noncontinuous floors is shown in Fig. 16, and the comparative cost in relation to the strength secured in Fig. 17, wherein all the examples are placed on an equivalent basis of 100 lb. per foot (10ft. spans). From this it will be seen that the equivalent value obtained for the cost is

almost equal in the continuous and non-continuous types, except in the too-heavily-reinforced floor, where the wastage is accentuated.

In order to secure an equable strength or resistance the floors must be one-fifth greater strength above the supports than in the centre of the span, in which event the safe loads will be—

4"	285 cwt.	per ft. super 10ft. spans
5"	270	" " "
6"	435	" " "

The design being exactly in accordance with previous illustrations, with the exception that the steel over the beam, or point of support, requires to be increased to secure a resistance equal to that in the centre of the span. This apparently small increase in the resistance would, however, necessitate an increase to 12 3/4 in. rods in the 4 in. floor (1 in. apart), 3 1/2 in. rods on 5 in., and 5 1/2 in. rods on 6 in. floor (2 in. apart). The cost diagram, Fig. 18, shows still more clearly how disproportionately heavy is the cost of the excessively reinforced floor, compared with the more scientific and accurately balanced types, and also that the extra reinforcement does not produce adequate returns for the outlay in the small

SCALE DIAGRAM. SHOWING ACTUAL COST OF MATERIAL IN 6 FT. BAY OF FLOOR, DESIGNED TO SECURE EQUAL RESISTANCE OVER SUPPORTS, 8 IN CENTRE OF SPANS, WHEN CONTINUOUS. AND THE COST PER 100 LB. RESISTANCE—AN ECONOMIC VALUE.

additional strength acquired. The enormous difference in cost between the 4 in. and 5 in. floors of practically identical strength is too striking to need further emphasis.

(To be continued)

THE REPORT OF THE ROAD BOARD.

The fourth annual report of the Road Board for the year ended March 31 last, states that applications for advances were made for £2,593,805, as against £1,508,272 in 1912-13. Of that total £2,304,637 was for the improvement of road crusts, £190,741 for widenings, diversions, and the improvement of gradients, curves, and corners, £37,892 for reconstruction, and £60,515 for new roads and bridges. The applications from England and Wales amounted to £2,127,793, those from Scotland to £265,747, and those from Ireland to £202,265. Since the institution of the Road Board Improvement Fund the net receipts have totalled £4,810,818, motor spirit duties realising £2,716,211, carriage license duties £1,923,415, and interest and profit on investments and loans £171,162. The net payments have totalled £1,686,647, administrative expenses being £43,135, grants paid £1,272,254, and loans £403,302. Loans were repaid to the amount of £32,104. The receipts for 1913-14 amounted to £1,481,398, an increase of £231,395; and the net payments to £924,959, an increase of £457,891; administrative expenses rose during the year by £3,764 to £15,690. Up to March 31, 1914, the grants made or indicated totalled £3,829,105, and the loans £1,584,707, making the total (less repayments) £5,181,708. Of this, £4,392,804 was for England and Wales, £480,885 for Scotland, and £308,018 for Ireland. The commitments of the Board in

THE LONDON COUNTY COUNCIL.

At Tuesday's meeting of the County Council a report was submitted by the Establishment Committee recommending the acceptance of the tender of Messrs. Morrison and Mason, Ltd., of Glasgow, amounting to £23,268 6s. 8d., for the construction of the eastern extension, in front of the premises now occupied by Messrs. Holloway Brothers, Ltd., of the river-wall at the site of the new County Hall. The Finance Committee reported that they had considered an offer by Holland and Hannen and Cubitts, Ltd., the contractors for the superstructure for the new County Hall, that advances may be made in respect of materials delivered on the site but not fixed. Clause xxv. of the contract with Holland and Hannen and Cubitts, Ltd., provides that, subject to certain conditions, payments on account "shall be made to the contractors by the Council at the rate of 90 per cent. upon the value of permanent work from time to time executed and fixed on the site"; but there is no provision in the contract for payments in respect of materials specially worked and delivered on the site but not fixed. The committee were advised, however, that, having regard to the value of the materials delivered and waiting to be fixed, there would be no objection to further advances being made to the contractors generally under the contracts, without prejudice to any of their liabilities and obligations under the contract, and to the rights and powers of the Council thereunder, and subject to the accounts being adjusted from time to time after the work is recommenced on the site, such adjustments to be completed unless otherwise agreed in writing within six months from the date of recommencement of the work. The committee thought it desirable that such advances should be made, having regard to the abnormal demands which will obtain when the present labour dispute in the building trade is settled, to the delay which may arise if the material worked specially for the new County Hall is not delivered by the time by which it is required, and to the possibility of the sub-contractors suspending their operations on work relating to the new County Hall, and therefore submitted a recommendation with this object. No advance will be made without a certificate by the architects. They recommended "That notwithstanding the terms of clause xxv., relating to payments on account, of the contract with Holland and Hannen and Cubitts, Ltd., the contractors of the superstructure of the new County Hall, the architects be authorised to issue certificates for further payments to the contractors generally on account of the contract, subject to the accounts being adjusted from time to time after the work is recommenced on the site and to such adjustments being completed, unless otherwise agreed in writing within six months from the date of recommencement of work."

The Highways Committee submitted a proposal for the widening of Grove road, Bethnal Green, between Wemington road and the bridge which carries Grove road over the Hertford Union canal, and a widening of the bridge. The width of the bridge is only 29ft., while the width of the road in the part mentioned is 33ft. A scheme has been prepared for increasing the width throughout this part, a distance of about 255ft., to a width of 50ft. The total cost is estimated at £8,000. Grove road, together with Burdett road, forms an important means of communication between the West India Docks, Limehouse, and Victoria Park.

The Council was recommended by the Fire Brigade Committee to make an experiment with a new fire-alarm system, at a cost of about £250, at a brigade station. The question of the desirability of installing a more modern system of apparatus has been under consideration for some time, and the north divisional officer of the Fire Brigade, accompanied by an official of the Post Office, has been in America inspecting systems in operation there. The Fire Brigade Committee recommend the closing of the Chelsea, Rushey Green, and Sydenham fire substations as soon as the neighbouring stations have been fully equipped with motor appliances.

respect of grants and loans exceed the actual net receipts by £414,025. The most pressing and the most universal need, it is stated, is the strengthening and improvement of the crusts (which include foundations as well as surface coatings) of existing roads. In a few districts important roads are so narrow that they need widening before any other improvement is attempted; but the general need of most rural and inter-urban roads is that they should rapidly be made fit to carry the increasing motor traffic satisfactorily to the road user and without undue deterioration of the road surface. In England and Wales, outside London and county boroughs, there are 27,879 miles of main roads maintained by or at the cost of county councils, and 111,884 miles of district roads. Of the latter 74 miles are being improved with the assistance of advances, and will in future be maintained as main roads. The Board have provisionally allocated for the purposes of works in Greater London £960,000, out of the total available amount of £6,000,000, on the population ratio, which the Board regards as the most equitable method of allocating grants.

Of this sum £400,000 has been set aside for the Brentford Loop road, from Kew Bridge to Hounslow, which will relieve Brentford High-street.

LECTERN, 81, JUDE-ON-THE-HILL, HAMPSTEAD GARDEN SUBURB, N.W.

This drawing is now on view at the Royal Academy. The lectern has been erected to the memory of the late Alfred Lyttelton, K.C., M.P., and it is executed in pine finished with a sand-blasted surface, to the design of Mr. Herbert A. Welch, A.R.I.B.A., of 7, New square, Lincoln's Inn, W.C.

The late Mr. William Porter, of Wells road, Malvern, builder, left net personalty £6,791 and gross £27,595.

The foundation-stone of a Methodist chapel has been laid in Boleton Road, Hartland, North Devon. Mr. Parsons, of Holsworthy, is the architect, and the contractors are Messrs. Cann, of Bude, whose tender was accepted at £1,360.

The Council decided by 57 votes to 50 not to appeal against the decision of Mr. Justice Astbury, adverse to the Council, in proceedings brought against the lessee of the Piccadilly Mansions in respect of the erection thereat of illuminated signs.

The Local Government Committee recommended the acceptance of the tender of Messrs. W. E. Blake and Co., Ltd., of Fulham, amounting to £98,980, for the erection within 21 months of the new Sessions House at Clerkenwell. The tenders had been invited from selected firms, and Mr. G. Dew, who said that every firm on the list had locked out their men, moved that the recommendation be referred back, with instructions to the Committee to arrange for the invitation of fresh tenders from firms who had not locked out their workmen. This was seconded by Miss Susan Lawrence. During a discussion, Mr. Gosling contended that the Council was taking the side of the contractors in the dispute in the building trade.—Mr. W. Ray, the vice-chairman of the committee, said that among the firms from whom tenders were invited were five who were not members of the Master Builders' Federation, and among firms tendering were two who were not members of the Federation—Mr. E. Gray, who said that the Council's traditional policy was to take no part in trade disputes, moved that the committee be instructed to accept Messrs. Blake's tender if they were satisfied that the firm were fully prepared to fulfil the requirements of the Council in respect to wages and labour conditions.

The discussion was adjourned at 7.30 p.m., when by its rules the Council proceeded to the consideration of unopposed business.

EARLY EIGHTEENTH-CENTURY. PULPIT, ST. ANNE'S, MANCHESTER.

This is one of the finest pulpits of the Renaissance period in Lancashire, and

belongs to St. Anne's Church, Manchester. It is said to have been designed by a pupil of Sir C. Wren between 1710-1720, and is made of oak. The pulpit is square on plan, with recessed angles, and fluted quarter Corinthian columns inserted into the splays.

The well-proportioned entablature has an architrave of three fasciae, also an ogee bellied and carved frieze to these features, including an enriched cornice with consoles. This cornice is continued only round the front and sides of the pulpit, the architrave and frieze occurring only over the quarter columns. The design of the ornament is very similar in character to that of the stonework outside the church, more especially the delicate acanthus foliations to the capitals and consoles. The leaves are long, acutely pointed, and hollow in section. Owing

EARLY EIGHTEENTH-CENTURY PULPIT, ST. ANNE'S, MANCHESTER.

perhaps, to the nature of the material, the foliage is by no means evenly balanced.

The excellent egg-and-tongue carving is of a very spreading and open type, also noticeable in the other woodwork of the church, such as the gallery and organ-case.

AUSTRALIAN ARCHITECTS IN THE UNITED STATES AND CANADA.

Two interesting papers were read on April 28 before the Royal Victorian Institute of Architects at Melbourne, brief extracts from which may interest. The first was by Mr. Kingsley Harrison, who made the best use of his time.

"I travelled via Sydney, Wellington, and

the problems the Americans have been up against, and the way in which they have solved them. I naturally thought of the problem which had confronted them concerning the housing of their huge business concerns in the cities, and its solution by the evolution of the skyscraper, with all the attendant factors of foundation, drainage, windage, high-speed elevators, and many others. Some of the New York office buildings are awe-inspiring, as, for instance, the Woolworth and the Municipal Buildings, the Singer, the Metropolitan Life, and the Bankers' Trust. Next, I would refer to the housing problem, and the solution of this problem by the distinctive type of apartment houses. There are 4,000,000 souls living on

pitals, of which we have no equal in Victoria. Further, we have nothing to equal, I am safe in saying, its Barbary Coast, the district given over to vice, which I was piloted through by a one-time Australian. The authorities of the San Francisco Hospital, before laying a brick of their new building, sent a doctor for five years' travelling, in order to acquire information from all parts of the world. From San Francisco to Los Angeles there is a journey of eighteen hours in a most comfortable train, though, in our case, we had not been travelling for twenty minutes before the engine jumped the rails, and we all slid out of our seats before the brakes were applied. Los Angeles, with its newly-built mercantile centre, is a city of immensely rapid growth, with 500 per cent. increase in its population during twelve years. Close by is Pasadena, where millionaires from all America have built winter homes, and beautiful homes they are, too. The city is without fences, and has beautiful roads, planted with palms and pepper-trees. There are concrete sidewalks and concrete approaches and terraces to the homes. One's first and lasting and altogether most pleasing impression is that of the absolute orderliness of home and garden, and a complete absence of outhouse and backyards. Everywhere there is a series of snug, comfortable homes and beautiful gardens.

"Thence we went to St. Louis, of which city I only saw the business and warehouse districts. St. Louis is a huge distributing centre for the States, like Los Angeles. It is an old city with a new heart, in which I saw warehouses from which the fire hazard has been eliminated as far as is humanly possible. These warehouses are internally absolutely fireproof, with all the stairs and lifts isolated, and the buildings are completely sprinklered. There are flat roofs with drenchers, ample window-lights all drenchered, and, as nearly as possible, safe from attack by fire from within or without. Next, Chicago, on the shore of Lake Michigan, was visited. It is a city with a commercial centre of about ten blocks each way, and outwards is a 15-miles' radius on north, west, and south of factories, stock-yards, residential suburbs, etc. Chicago has a 250ft. building limit, and the consequence is that the city is very thoroughly built up to the limit, and one might say that, from the building point of view, it is the most typical of the American cities. We next went to Washington, a 26-hours' run through Pittsburg, Harrisburg, Alleghany Mountain, where the oil, coal, and steel industries everywhere appeared. Wonderful Baltimore was reached about 6 p.m.; Washington at 8 p.m., where is the Nation's Pride, the Home of History, and the Home of National Sentiment. It is a city of magnificent public buildings, street vistas, squares, and statuary. The Washington Monument might be seen from anywhere, as it has a searchlight shining upon it from dusk to dawn. The Great Capitol was to be seen from everywhere. The Library, White House, Army and Navy Buildings, Museum, Smithsonian Institute, the Foreign Legations, Arlington Cemetery, and Grant's Home, Abraham Lincoln's deathbed, the great museums, which house the nation's historic treasures, the Corcoran Art Gallery, constitute some of the city's most valued possessions. Visit Washington, the capital city of the great American Federation, and come home, and you will say Australia will never be truly federated until our national and federal institutions have a permanent home.

"I cannot tell you much about New York. I cannot give you the spirit of the city. I suggest that there you must go hard, for you must live well and work hard, you must spend, and feast, and be entertained. The concentrated spirit of the whole American race is there. Everything is huge and costly, and there is a daring about it all in their buildings, bridges, tunnels, shipping, transport, and a great display of wealth. An American writer says: 'I saw a mighty city full of a kind of iron gladness, a thousand sky-scrapers reaching up and up and up, and crying, 'I will, I will, I will.' to God.' I spent three weeks in New York, and in the middle of my

EARLY EIGHTEENTH-CENTURY PULPIT, ST. ANNE'S, MANCHESTER.

the Islands of Raratonga and Papeete, to San Francisco. I passed through the Golden Gate about 10 a.m., as the mists were clearing, and it was certainly a magnificent entrance. After a stay in San Francisco, I visited Los Angeles and Pasadena, and from Los Angeles I traversed the desert, spending three days and three nights in the train to St. Louis, and staying five hours in Kansas City en route. From St. Louis I went to Chicago in the night, then to Washington with a 26-hours' run, and from Washington to New York in the night again. In the middle of my stay in New York I went down to Philadelphia, and visited its Architectural University. From New York I turned my face homeward, visiting Buffalo and Niagara, Chicago a second time, Minneapolis, and had a short stay at Winnipeg. From Winnipeg I went over the Canadian prairies, through Medicine Hat, Moose Jaw, and Calgary to Vancouver. Leaving Vancouver, I visited Honolulu, Suva, and Auckland, thence by Sydney to Melbourne.

"I would submit a few thoughts regarding

Manhattan Island, which is fourteen miles long and two and a half miles wide, with the business quarter at the south end, the shopping district in the centre. Poverty exists on the two edges (S.E. and S.W.), and apartment houses, miles of them, are built up-town at the north end. There are streets on streets of nine- and ten-story apartment houses, with often a hundred families living under one roof. There is ingenious planning about these apartments, ingenious services of all kinds for comfort, and enormous rentals to be paid. The day-lighting of the skyscrapers, with the possibility of the light-well being built in, has brought about the arrangement of light-wells on the street frontages, where the sites permit. The soiling of the façades of the city buildings has brought about the use of cream and other coloured terracotta ware, which can be washed down regularly. San Francisco I visited first. But eight short years ago the city was burning fiercely, and was torn and rent by earthquake. A city with hotels, clubs, department stores, offices, and hos-

stay I went to Philadelphia for two days, principally to see its architectural university. I spent one and a half hours with Professor Laird, and went through the architectural school and a portion of the other schools. I travelled from New York to Vancouver in nine days, peeping at mighty Niagara and Buffalo City on the journey; I then spent another day in Chicago. I visited a huge grain elevator in Minneapolis. Another day was spent in Winnipeg, the wonderful city of Central Canada. Then a day in the Rockies, amongst the snow, the ice, and glacier, and mountain peak. My last four days in America were spent in Vancouver.

"I must preface my notes on types of buildings by a passing reference to the dollar. Buildings mostly consist of floors, ceilings, walls, columns, windows, doors, lift stairs, special fittings, and planning devices for special purposes. There is nothing mysterious about American buildings in this respect; they possess the same common elements. The difference between American city buildings and those to which I was used was first the size, and second the first cost. To the student who has followed his 'building construction' there is no hidden mystery. I saw steel-framed buildings in course of erection in every city visited, and we in Australia are working on exactly the same lines. I saw underpinning works and cantilever foundations, and throughout the construction is simple and effective. I saw concrete structures in course of erection, and the same remark applies, though I think we design more economically in Australia, using more steel and less dead-load concrete. I saw frame buildings in every stage of construction, and watched them grow from day to day. I discussed with engineers the questions of sway-bracing, eccentric column loading, and wind-bracing, especially in Chicago, and found that we work on the same system as regards the checking of the calculations by the civic authorities. I saw a theatre in Chicago in which there was no carpentry, and there was nothing 'burnable' except the upholstery of the seats. I did not see a single lift enclosure which would be permitted by our regulations, nor even one moderately 'finsh' formation. I saw hotels, apartment-houses, and private homes everywhere, and have brought plans of such, which our sewerage regulations would not allow to be built."

MODERN RENAISSANCE IN THE UNITED STATES AND ITS CAUSES.

The second paper was by Mr. John S. Gawler (A.): "Briefly stated, I consider the causes of the Renaissance in America to be as follows: First, the rapid increase in population caused a great era of development and expansion of industry, one of the results of which has been a phenomenal growth in the cities, causing the last twenty or thirty years to constitute a building era of the greatest activity. Second, the wealth, both of the nation and the individual, have brought about the consequent ability and desire to expend large sums of money on monumental buildings. Third, the increased facilities for travelling to Europe have enabled, not only architects and artists—who had special reasons for going—but numbers of wealthy and influential classes, to make the trip, not once, but often. When in Europe, notably in France and Italy, the Renaissance buildings, pictures, and sculptures naturally enough attracted the attention of all these visitors. Fourth, the influence of the Ecole des Beaux Arts on young American students and architects, who journey to Paris in considerable numbers to study there. In passing it is interesting to note that the most of them seem to lose their individuality to some extent, their work being correct and scholarly, but like east iron in its lack of feeling. Of course, a few, whose genius is great, rise superior to the hide-bound methods of the school, getting from it only benefit. In this connection might be mentioned Mr. H. H. Richardson, who spent seven years in Paris after graduating from Harvard University. He did a great deal towards introducing French academic methods. His best works, carried out in the Romanesque style, have a rugged strength and beauty more likely to

be learned from the hills and mountains of his native land than in the French school. Another Ecole des Beaux Arts student of great originality is Mr. Louis H. Sullivan, of Chicago, who originated a style of decoration entirely his own. It is mostly surface decoration on plain, broad surfaces, alternating with boldly-cut window- and door-openings. Fifth, the immigration to the United States of numbers of craftsmen and tradesmen from the British Isles, Germany, France, and Italy. Sixth, the evident suitability of Classic forms, treated after the manner of the Renaissance, to modern public buildings, such as libraries, art galleries, capitol buildings, post-offices, banks, railway stations, etc. Seventh, the development of extensive granite and marble quarries within reasonable distance of the cities. Some people might question the reasons I have set down; but be that as it may, all who have travelled across the United States, who know anything at all about architecture, must agree that in the last decade there has come a different spirit over the work. It has grown more thoughtful, broader, and most imposing. Great attention is paid to detail, while the main masses are boldly and simply placed. Where beautiful material has been obtained, broad, plain surfaces are freely used, being contrasted and brought out, perhaps, by rich and beautiful doorways or entrance archways. Undoubtedly the American people have a great love of the spectacular. They love imposing personages, whether they are orators, statesmen, or great men of any kind. Their love of the spectacular is seen in the way the 'Stars and Stripes' appears everywhere. The same national characteristic is abundantly seen in the public buildings. They are in the main beautiful, and appealed to me as full of feeling and brains. The Renaissance, as I felt it, seemed a Renaissance of the true spirit of architecture, and not merely a Renaissance of Classic forms. It is certainly true that the most noticeable tendency in modern work has been towards the Italian Renaissance. This was probably initiated by a group of men in New York City. Mr. J. M. Wells, a partner in the firm of McKim, Mead, and White, is said to have done more than anyone else in starting this movement towards Italian Renaissance, which began about the year 1889. The firm of McKim, Mead, and White, and a number of others have succeeded in popularising what I think the nation was just waiting for. Mr. McKim and others started also what is now known as the 'American Academy at Rome.' A nation-wide competition is held annually to select an architect, an artist, and a sculptor from among the young men of America. These fortunate prize-winners then have three years' residence in Rome, spending a great portion of their time travelling, and the balance in study at Rome, under the leadership of a resident leader of repute. It is planned that these young men, on graduating from the academy, should return to the United States and become professors and lecturers in the various schools of architecture.

"Another thing that must strike the architectural visitor to the United States is the number of schools of architecture. Almost every University has a Chair of Architecture of more or less importance. This is not a cause of the modern Renaissance, I think, but one of the effects. While a great many of them are certainly indifferent training grounds, numbers are very good, such as the Massachusetts Institute of Technology, University of Pennsylvania, Columbia University, University of Illinois, etc. Another result of the Renaissance of architecture in the United States that has great interest for us in Australia at this time is that compulsory registration of architects is being seriously considered in most parts of the country. Three of the States at least have a satisfactory law in operation. I would like to give an outline of the law for registration of architects in Illinois, as I worked in Chicago, Illinois, for about a year, and consequently had an opportunity of seeing the working of the law to some extent. The title of the law is 'An Act to provide for the Licensing of Architects and Regulating the

Practice of Architecture as a Profession.' It has been in force since 1899, and is generally accepted by architects and the public as an efficient law for public safety regarding buildings. Anyone wishing to become a licensed architect must submit to an examination held by the State Board of Examiners, consisting of five members, one being a member of the Faculty of the State University, the other four being architects who have been in practice at least ten years. This examination lays special stress on construction of buildings, strength of materials, sanitation, knowledge of supervision, and the ability to turn knowledge of building to practical application. The art side of the profession and knowledge of Classic forms and architectural history are only slightly touched upon. Every licensed architect must have a seal, and no building of any sort can be erected in the State of Illinois unless the plans and specifications for it have on them the seal of a licensed architect. No stock company or corporation may practise as architects, though, of course, they may employ licensed architects. For gross incompetency, reckless construction, or dishonest practice, licenses may be revoked by the Board of Examiners. There is an entrance-fee of 25dol., and an annual fee of 5dol."

A SUNDIAL IN PORTLAND STONE.

Many readers who from time to time ask for designs for sundials may be interested in this.

The work represented is a recently completed sundial, carved in Portland stone,

representing the seasons. It is square on plan, 4ft. high, 1ft. 6 $\frac{1}{2}$ in. base. It has been produced in collaboration with Mr. C. H. Pike, of Messrs. Jupp and Pike, Templecombe, by Mr. Alfred Buxton, The Studio, Thornton-street, Brixton-road, London, S.W., the R.A.G.M. Student of 1909, on whose work then we commented in the BUILDING NEWS of Dec. 17, 1909.

A new Roman Catholic church in Upper Beechwood-avenue, Ranelagh, was consecrated last week by the Archbishop of Dublin. It is Romanesque in style, and is built of Ballyknocken granite. The architects were Messrs. W. H. Byrne and Son, of Dublin, and Mr. Kevin Toole was the builder.

Currente Calamo.

We are still in hopes that sectional agreements between the men and the London Master Builders will end the dispute ere long. In addition to the trades mentioned last week, the smiths and fitters have come to terms, and it is probable that before the end of the week other trades will come in. Our best advice to the men of all trades is to do so, or the end of the month will see a general lock-out proclaimed of all union labour. A largely-attended meeting of London master builders who are not members of the London Master Builders' Association was held at the Holborn Restaurant on Tuesday afternoon, Mr. William Willett presiding. Deputations attended from the London Master Builders' Association and the London Association of Master Decorators. After discussion, the following resolutions were passed:—

"That, in the opinion of this meeting of master builders who are not members of the London Master Builders' Association, the time has arrived when further steps must be taken to bring the present dispute in the building trade to an end.

"That all present at this meeting undertake to close their works to union labour on August 1 next if a settlement be not arrived at in the interim.

"That a committee be appointed to report how this resolution can best be carried out, and whether the basis of membership of the London Master Builders' Association can be broadened so as to bring in all classes of master builders in the London district."

A committee was appointed to carry out the third resolution, and has since been busy. The master builders who have hitherto held aloof evidently see at last the necessity of organisation for defence.

Now that is so, we believe the National Federation of Building Trades Industries, which is naturally the most powerful and representative body numerically, will have little hesitation in proclaiming a general lock-out throughout the country if the London workmen do not come to terms before August 1. It must do so, in self-defence. Because if the London Master Builders' Association is beaten, then the National Federation of Masters and the national executives of the really representative unions will have been beaten by the aggressive faction of unionists who for the time have captured the London workmen and persuaded them three times to disregard the action of their own executives. A general lock-out, of course, will be most disastrous to all of us. It should not be, and we believe will not be undertaken until the last effort for peace has failed. But if it is to come, we are sure that it will be the briefer and the less disastrous if all the employers act together and at once. Our advice, therefore, to the provincial members of our industries is to bear this in mind, and not to stand aside six months, as the outside London builders have done, and then trickle in at last because they have no choice.

All our advices from the provinces convince us that this necessity is recognised. In addition to the meetings held before we went to press last week, which are being addressed by missionaries of the London Master Builders' Association, others have been held at Manchester, Grays, Grimsby, Rochdale, Batley, Wolverhampton, Newport (Mon.), Gloucester, Burton-on-Trent, Portsmouth, South Shields, Bury (Lanes), Accrington, on the Tyne, at Sunderland, and other centres, and at each the determination to vote for the general lock-out has been unanimous.

The ballot papers for the national lock-out, which were issued last week, are returnable on the 27th inst. They were sent to the secretaries of all the local associations, who will be responsible for counting the votes and sending the returns to the National Federation. The result of the ballot will come before the Administrative Committee of the Federation at its meeting to be held at Cardiff. Many more meetings are arranged for the coming fortnight, and our conviction is that the men will find presently the contention of the London militants, that the threat of a general lock-out is "bluff," will prove as misleading as the rest of the rhodomontade with which they have lauded the London workmen in the bog of disaster, simply to secure their own ascendancy and to raise a so-called "Federation" on the ruins of the respectable unions. The net result, as far as the unions are concerned, will be that, while the strongest unions, which have been able to weather the storm without bankruptcy, may go back "as they were," the smaller trades will be worse off than ever, and will have to thank "Larkinism" for it!

It is to be regretted that the text of the Government Housing Bill makes its insufficiency evident. It is inadequate; it fails to make any provision for industrial areas, and its supersession of the local authorities is a serious defect. We are sure that local information as to requirements and local supervision in supplying them cannot be replaced by a central authority. It is curious that the section of the Bill which Mr. Runciman stated was intended to deal with Rosyth makes no mention of that place. Its provisions under the head are so general that they might refer to the housing of any body of Government employees, and not even extend to Post Office servants, for whom, in most English villages, it is difficult to find accommodation. Remembering the period at which it has been introduced, and the present chaotic state of Parliamentary business, the Bill has little prospect of passing this session, and less of affording hereafter any basis of real effort to solve the problem which daily becomes a more urgent one.

"Extraordinary traffic" is a term which, having got into an Act of Parliament, has now acquired a technical meaning. But looked at only in the light of common-sense, it is a phrase which would certainly cover the use of our main roads by the modern motor-bus. It is in this way that business people will consider it unfair that while contractors have to pay for cutting up the roads by traction-engines and the like, our many motor-buses can still tear away the road surface without making any contribution anywhere. The Middlesex County Council have done good work by putting a clause into their Bill which provides that those bus companies shall pay them 3ths of a penny per car-mile towards the expense of maintaining the new thoroughfare—Western road—which their buses will have to use largely. They have got their Bill through the Commons, and it has now been passed by the Select Committee of the Lords. This is likely to become an important precedent, for other county councils about the country will no doubt adopt the same plan, with this moral force behind them. Assuredly the harmless body of general ratepayers should not be made to bear the burden of the cost of constantly

remaking roads which have been cut to pieces by the motor-buses.

At the same time it is true that the proposed way of getting a contribution out of the companies is cumbersome and archaic. It is held by the Roads Improvement Association to be as bad in principle as in practice, and to be a return to something like the old toll-gate system. It is also difficult to believe that all our local authorities will act on the same lines and pull together harmoniously to produce one uniform result. It seems that the companies are going on to fight the Middlesex Bill for all they are worth, so as to stop this sharp thin end of the wedge from penetrating their privileges, and the Prime Minister has promised a general inquiry into the whole matter, which may report in a year or two! Meanwhile, the comparisons made to the disadvantage of the London County Council are ridiculous, because the cost of laying and maintaining their tramlines is a heavy item which the bus companies escape altogether. Probably the day is not far distant when all these will be scrapped, as being too costly.

The Duke of Bedford's Covent Garden Estate seems to have been sold yet once again. It is now stated that Sir Joseph Beecham's interest in the estate will be acquired by Mr. Alexander Lawson Ormrod (Lawson and Ormrod, Manchester), and that he will be the principal in the contemplated negotiations for the disposal of portions of the property. It is intended to offer tenants an opportunity of purchasing the freeholds outright and of acquiring long leases. Asked in the House of Commons on Monday whether he was aware that an estate known as the Covent Garden Estate had changed hands recently for a sum of money stated to be approximately £3,000,000; whether all the hereditaments comprising this estate had had their total and site values ascertained and recorded; whether they had been assessed for increment land value duty on the occasion of such sale; and whether he had been able to form an estimate of the total sum that would accrue to the State by way of increment value duty, Mr. Lloyd George replied that his attention had been drawn to the transaction. Particulars of the reported sale, however, were not yet available to the Commissioners of Inland Revenue, and he could not answer the second part of the question. The answers to the third and fourth parts of the question were in the negative.

Hardly a week passes but the cry of the "famine in houses" is heard in one part of the country or another, and it has been long manifest that but for the harassing legislation and the aggravating labour quarrels of the past four or five years builders almost everywhere would have been as busy again as they could wish. The latest complaint comes from Wallasey, where a builder says in the local press the "famine of houses" applies not only to houses of the small rental of 7s. 6d., but to tenements commanding rents ranging from 9s. to 13s. a week. To some extent the combined action of the cartage contractors and team-owners is held responsible for this difficulty. In consequence of the combination referred to, the cost of cartage during the past six or eight months, it is alleged, has gone up to a very high figure. Is it not a fact, it is asked, that when the carters received an increase of

wages of 2s. a week for one-horse work and 3s. a week for teams, the contractors demanded from builders the like increase per day? Another grievance in the new county borough is that there is too much red-tape. A purchaser of land some time ago sent in his plans, but the council put the Town-Planning Act into force, and nothing further was done, although the houses proposed to be built on the property would have been equal to those already in existence in the neighbourhood. Another element is that building materials have gone up from 17 to 22 per cent. at least, and yet another is the difficulty which the speculative builder has in obtaining mortgages to the extent of two-thirds of the value of his property.

OBITUARY.

We regret to learn of the severe bereavement which Mr. Frederick Moore Simpson, F.R.I.B.A., Professor of Architecture at University College, Gower-street, and of 3, Brunswick-place, Regent's Park, has sustained in the death of his wife. Mrs. Maud Mary Simpson, who was 44 years of age, died on Sunday last at The Ridge, Chelwood Gate, Sussex. The funeral takes place tomorrow (Saturday) at 2 p.m., at Danehill, near Forest Row railway station.

Mr. James Herbert Stones, F.R.I.B.A., of Railway-terrace, Blackburn, and Marlborough-road, Tuebrook, Liverpool, died on Friday last. He had been a Fellow of the Royal Institute of British Architects since 1889.

The Hammersmith Borough Council have under consideration a proposal to extend the town-hall premises on an adjoining vacant site at an estimated cost of £20,000; the first portion, only one story in height will be proceeded with at once at a cost of £6,000.

The urban district council of Newbiggin have decided to build an infectious diseases hospital with eight beds for scarlet fever, eight for diphtheria, and two for enteric fever, with accommodation for caretaker and nurses, on North Seaton lugs. This will cost £3,600.

At a cost of £226,500 the Mersey Docks and Harbour Board are about to erect a shed occupying a space of 15 acres on the south quay of the new Gladstone Dock at Liverpool, with the necessary cranes and railway lines for handling cargo. The shed is to be a three-story building, and is a new feature at the Liverpool Docks, so far as it is to be set back from the quay so as to allow space for a double set of railway-lines.

The new open-air municipal sea-bathing lake on the shore at Southport, to the north of the pier, was opened on Monday by the Earl of Derby. The cost of the lake is stated to have been about £3,500, and the work was carried out under the direction of the borough surveyor, Mr. A. E. Jackson. The work had, it was mentioned, cost about £1,000 less than the lowest tender from a contractor. The lake is 400ft. long by 200ft. wide, with a maximum depth of 6ft. 6in., and a minimum depth of a few inches.

Mr. Thomas Adams, Local Government Board inspector, held an inquiry at the Merton Council-chamber on Friday into an application by the urban district council for authority to prepare a town-planning scheme with reference to 2,805 acres in Merton and Morden, and 125 acres in the parish of Mitcham. Opposition was entered by the London and South-Western Railway Company, the London, Brighton, and South Coast Railway Company, the Wimbledon and Sutton Railway Company, and a number of owners of property. Mr. C. J. Mountfield, clerk to the district council, explained the proposals.

The memorial statue erected by the townspeople of Cheltenham in honour of Dr. Edward Adrian Wilson, the artist and zoologist of the British Antarctic Expedition, who perished with Captain Scott on the great ice barrier, was unveiled on Friday by Sir Clements Markham, K.C.B., F.R.S., F.S.A., who in 1850-51 took part in the Franklin expedition. The memorial statue, which was executed in bronze from a plaster cast taken of the modelled design of Lady Scott, represents Dr. Wilson in sleighing-kit. The figure is 7ft. in height, and stands on a pedestal of Portland stone. The statue has been placed at the south end of the Long Garden in the Promenade.

Building Intelligence.

CHICHESTER.—Large factory premises at Chichester, Sussex, for the Chichester and District Co-operative Bacon Factory, Ltd., are about to be erected in close proximity to the cattle market and railway station on the south side of the L.B. and S.C. Railway. The proposed buildings cover an area of about 275ft. long and 85ft. wide, a portion having an upper floor. The plans have been prepared to embody the most up-to-date methods in the arrangement of the departments, construction, and general design, and will be fully equipped with the latest machinery and appliances to deal with the killing of 750 pigs per week in three killings of 250 pigs at one time. The architect is Mr. G. C. Vernon-Inkpen, M.S.A., 40, Commercial-road, Portsmouth.

DUNDEE.—The new town-hall, of which the King laid the foundation-stone on Friday, is being built at a cost of £100,000, provided by Sir James K. Caird, Bart. It will occupy an island site immediately to the south of the existing town-hall in High-street, and bounded by Shore-terrace, Crichton-street, and Castle-street. On the east and west sides beneath the hall there will be blocks of business premises. The whole frontage towards the open quadrangle in the centre will be occupied by two flights of steps. The main entrance to the hall is in the centre, and consists of three doorways, opening into a crush-hall 60ft. long by 25ft. wide. To the east and west is provided cloakroom accommodation. The hall will be enclosed by corridors 10ft. wide along three sides, and at the west end will be a refreshment-room, 82ft. by 30ft. This supper-room will be connected by lift with a servery and kitchen, 60ft. by 50ft., on the upper floor. The hall proper will provide accommodation for 3,500 people. It will contain two side galleries and a back gallery, while the east end will be reserved for the platform and orchestral space. Due to the fall of the ground there is a difference of 26ft. in the level of Shore-terrace compared with the High-street, and this space will be taken up by two floors utilised for departmental purposes, and enabling the public hall proper to be on the level of the High-street.

The River Tees Commissioners, at the meeting at Middlesbrough, decided to proceed with the widening of the river at Blue House Point, at an estimated cost of £2,600.

The death occurred at his residence, Malvern Lodge, Castleview-road, Strood, North Kent, on Friday, of Mr. John Bean Martin, the founder of the firm of Martin, Earle, and Company, cement manufacturers, Wickham. Mr. Martin, who was 80 years of age, formerly practised as a veterinary surgeon, and was also in an extensive way of business as a jobmaster, bus proprietor and contractor. He purchased Wickham factory, then quite a small concern, 22 years ago, and was later joined by Mr. Vavasour Earle.

With the proceeds of the National Loan Exhibition held at the Grosvenor Gallery last winter, the committee have bought for the Tate Gallery several oil paintings and a water-colour design for a frieze from Miss Mary Davis, amounting in value to £2,500. The pictures are by William Orpen, "The Anglers"; Oliver Hall, "Avignon"; H. Muhrman, "Kew Bridge"; A. McEvoy, "Portrait of a Man"; W. W. Russell, "Donkeys and Kites"; John Lavery, Anna Pavlova—"La Mort du Cygne"; and Gerald F. Kelly, "Ma El Gyaw, A Dancer." The pictures were chosen by Earl Plymouth and Mr. Francis Howard on behalf of the committee.

Sleaford Rural District Council adopted on Monday a report of a special committee appointed to inquire into the circumstances surrounding the trial of the case "Fisher v. the Rural Council." The finding of the jury, the committee pointed out, was that Fisher's death was due to the negligence of the Council, and for this negligence the committee submitted that Mr. Marsden, surveyor and engineer, was responsible. The committee also recommended that the clerk, who, they regretted, was unable to perform his duties owing to advanced age, should tender his resignation. The report was signed by all the members of the committee, except one, who thought milder treatment should be meted out to the clerk.

Engineering Notes.

NEWPORT, MON.—The new lock, providing a deep-water entrance to the docks from the Bristol Channel, opened by Prince Arthur of Connaught on Tuesday, is the largest in the world, and has cost over £2,008,000. In 1906 the Alexandra Dock Co. obtained Parliamentary powers for the construction of the new lock, which is 1,000ft. by 100ft., and for a further dock extension of 27 acres to complete the rectangular dock, of which 48 acres, opened in 1907, formed the larger part. The contract for the lock and dock extension was let to Messrs. Easton Gibb and Son in December, 1906. The lock is divided into two compartments, that opening into the dock being 600ft. long, and the outer portion opening into the River Usk being 400ft. long. The depth of water on the outer sill at high water of spring tides is 45ft., and at high water of neap tides 35ft. Two timber jetties—one 450ft. long and the other 750ft. long—extend across the foreshore from the extremities of the wing walls. On the west side of the west jetty landing-stages have been provided for pleasure steamboat traffic. The channel itself has been considerably deepened and widened, the bottom width at its narrowest part being about 650ft., increasing to 800ft. at the limits of the Commissioners' jurisdiction, and to 900ft. opposite the new lock. The dredging has involved the removal of one and a half million tons of material. The lock is provided with three pairs of hydraulically-operated gates supplied by Sir William Arrol and Co. The dock is 4,000ft. long and 12,000ft. wide, and the extension has involved the construction of a length of 3,600ft. of concrete walls. The South Dock and extension of seventy-five acres was dredged to 33ft., but the inner sill of the lock and foundation of quays is such as will permit of a depth of 38ft. being ultimately provided. The length of the new south quay from east end to new lock is 3,600ft.; it is equipped with twenty hydraulic cranes, with lifting capacities ranging from 1½ to 10 tons. A separate dock pumping and electric lighting and power plant has been installed in a station built at the south end of the new lock entrance. New hydraulic coal-hoists are working on the north side of the dock, and Sir W. G. Armstrong, Whitworth, and Co. are erecting three additional high bunkering hoists. The extension works have been carried out under the superintendence and from the designs of Sir John Wolfe Barry, Lyster, and Partners, of Queen Anne's Gate, Westminster, S.W.

At the meeting on Monday of the city council of Nottingham, the report of the housing committee for clearing, laying out, and rearranging the Carter-street and Manvers-street slum area was eventually carried by 28 votes to 5. Widened thoroughfares will be driven through the district, now notoriously unhealthy. The estimated outlay on the scheme is £140,000.

Mr. R. H. Bicknell, M.Inst.C.E., Local Government Board Inspector, attended at the town-hall, Darlington, on Monday, to consider an application by the corporation for sanction to borrow £11,600 for works of private street improvement, £8,372 for re-surfacing streets with tar macadam, and £3,991 for the widening and improvement of Houghton.

The Norfolk County Council decided last week to rebuild the highway bridge at Ludham, and, after some discussion, resolved (in accordance with the recommendations of the bridges committee, who considered that the work of Mr. Heslop, the county surveyor, should be lightened where possible) that Mr. Russell, who was the engineer for Magdalen bridge, be requested to undertake the work upon the usual terms.

At the last meeting of the town council of Northampton, it was reported by the water committee that Messrs. Moss and Sons, of Loughborough, had, since its acceptance, withdrawn their tender to construct the Hollowell water-supply tunnel for £16,100. The Water Committee recommended that the work be carried out by direct labour, under the supervision of Mr. F. Tomlinson, the water engineer, and this was agreed to. The difference between Messrs. Moss's tender and the next lowest was £5,337, while Mr. Tomlinson's estimate was for £14,900.

COMPETITIONS.

ANGMERING.—The designs by Mr. Horace T. Bonner, A.R.I.B.A., have been selected for the proposed Sports Club at the new village-by-the-sea, East Preston, near Angmering, Sussex. The scheme provides for the usual accommodation for club members, and a large covered badminton court, dining-room, and offices.

BRADFORD.—In connection with the re-planning of the centre of Bradford, a costly scheme for which Parliamentary powers have been granted, the city corporation intend to invite competitive designs, offering three premiums of £500, £300, and £200 respectively.

CANBERRA PARLIAMENT HOUSE.—Further particulars are sent us of this competition, which we announced a fortnight ago. It is for the purpose of selecting the architect of the Parliament House, and possibly, incidentally, an additional architect for other Government structures of the new Federal Capital city, Canberra. Only tentative outline sketch designs for the building are requested, and eight prizes are offered, aggregating £6,000, the first being £2,000, in addition to commission for service at the scale of the Royal Institute of British Architects. The designs may be submitted in either Melbourne or London, by the end of March, and will be judged by the following jury of architects, whose decision will be final: George T. Poole, of Australia; Sir John J. Burnet, of London; Victor Laloux, of Paris; Otto Wagner, of Vienna; Louis H. Sullivan, of Chicago. The programme will be issued to any practising architect on application to the High Commissioner for Australia in London, or any British Ambassador, to whom copies are being forwarded. The importance of this event, we are told, is not to be measured by that of the foremost building of the Commonwealth, but by the opportunity to establish an architectural standard, not only for the future seat of Government in Australia, but for a great new Democracy of scope, scale, and modern advantages, as well as of climatic conditions differing radically from any prototype in Europe or elsewhere.

GILDERSOME HOUSING PROJECT.—The urban district council of Gildersome, near Leeds, adopted on Monday the report of the special housing committee, which recommended that the council should advertise for plans and designs of twenty houses at a cost ranging from £200 to £270 per house, inclusive of land, sewers, and streets, to be erected on the Grove Park Estate. A member stated that the committee were of opinion that the houses, which should contain a living-room and scullery, with bath on the ground floor, and two good bedrooms on the first floor, could be built at a rental of 5s. 3d. clear.

NEW YORK.—As a result of a recently conducted competition, Messrs. Jackson, Rosecrans, and Waterbury, 1328, Broadway, New York, architects, have been selected to prepare plans for, and supervise the construction of, the Hotel Irwin for women. The proposed structure will be located at 308 310 312, W. Thirtieth-street, New York, will be twelve stories high, and will cost approximately £50,000 sterling.

OTTAWA.—The competition for the new Departmental and Court Buildings, Ottawa, in which contest Mr. T. E. Collett, P.-P.R.I.B.A., acted as assessor, does not appear to be progressing with marked rapidity, and no date has been fixed for the reception of the final six designs. The authors' names, as a matter of fact, are not yet known by the authorities, as their envelopes have not, so far, been opened, and for this reason the preliminary plans have not been returned to the selected architects for elaboration, in conformity with the terms of the conditions.

PENZANCE.—At their last meeting the town council adopted conditions for inviting architects to send in competitive plans for twenty-two workmen's houses to be built on the Weeth's field, and agreed to offer a premium of £10 to the architect whose plan was

most in accordance with the conditions, in the event of it not being adopted.

THE SHAKESPEARE MEMORIAL NATIONAL THEATRE. The committee are about to invite photographs of drawings of important buildings, with the view of selecting from the authors thereof six architects to compete for the new National Theatre. Mr. T. E. Collett, P.-P.R.I.B.A., will draw up the conditions, select the six competitors, the committee reserving the right to add two more names and award the premium. The author of the design placed first will receive 500 guineas, to be merged in his remuneration. The other five will be paid each 150 guineas. Preliminary conditions may be had of the Secretary, Shakespeare Memorial Committee, 3A, Dean's yard, S.W. Drawings and photographs must be sent in by September 15.

WIMBLEDON.—For the altar to be erected in the Roman Catholic church at Wimbledon as a memorial to the late Father Kerr, the design of Mr. George Drysdale, A.R.I.B.A., 5, John street, Adelphi, W.C., has been unanimously selected by the memorial committee.

The city council of Birmingham accepted on Tuesday with gratitude the bequest by the late Mrs. John Edward Wilson, of the well-known and somewhat gloomy picture by E. W. Leader, R.A., entitled "February Full Oyke."

At their meeting on Monday, the urban district council of Arnold decided to offer the owners of the Hills estate on the Nottingham-road £250 per acre for 1½ acres, with all buildings thereon for the purposes of a public park.

The King has been pleased, on the recommendation of the Secretary for Scotland, to approve the appointment of Mr. Thomas John Jenn, M.D., presently lecturer on Geology at the University of St. Andrews, to be Regius Professor of Geology and Mineralogy in the University of Edinburgh, in the place of Professor James Geikie, who has resigned.

At the meeting on Tuesday of the Birmingham City Council, the recommendation of the water committee in favour of the provision of a third pipe on the siphon sections of the aqueduct from the Elan Valley to Frankley was approved, and the committee were instructed to submit designs and an estimate for the work. The provisional estimate for the undertaking was mentioned as £700,000.

The Duke of Richmond and Gordon laid on Wednesday the foundation stone of the new hospital at Hastings, with full Masonic ceremonial. The building is to cost £50,000, and is to be erected as a memorial to King Edward. The architects are Messrs. John Saxon Snell and Stanley M. Spoor, whose designs were selected in competition by the referee, Mr. Edw. T. Hall.

The Admiralty has accepted tenders for the construction at Rosyth naval base of 20 oil-tanks and an underground oil-reservoir, which, it is stated, will be the largest in the world. Ten of the tanks are to be erected by the Carronfield Oil Works Company, and ten by the Motherwell Bridge Company. Messrs. Easton, Gibb, and Son (Limited), the contractors for the docks, will construct the reservoir.

Prince Arthur of Connaught laid yesterday (Thursday) the foundation-stone of the British Columbia Government's new building at the corner of Regent-street and Charles-street, S.W. The ground floor will be occupied by an exhibition hall 87ft. by 42ft., for the display of products of the province, and over this will be four stories of offices. Mr. Arthur Barr, F.R.I.B.A., is the architect of the premises, which were illustrated by a double-page perspective and a plan in our issue of December 5, 1913. The estimated outlay is £75,000. The builders are Messrs. Holland and Hammen and Cubitts, Ltd., of Hyde-street, Bloomsbury.

At the meeting on Monday of the Edinburgh School Board, Mr. Lawrence proposed that notice to terminate agreement between the school board and Mr. J. A. Cartier, architect, be duly given to Mr. Cartier in order that in the erection of any new school buildings competitive designs be publicly invited. He said his motion rested purely upon principle. He wished an equality of opportunity for architects. Mr. Elder seconded and pointed out that the Glasgow Board had no architect. Mr. Cartier, he said, got an undue preference over his fellow architects. It was agreed to commit the matter to the building committee, and the finance and law committee, to draw up a report.

PROFESSIONAL AND TRADE SOCIETIES.

BRISTOL SOCIETY OF ANTI QUARIES.—The second excursion under the auspices of this society took place on Saturday, the venue being Edington and its Monastery Gardens. The party, including Mr. J. I. Francombe, president, and Mr. W. F. Kumer, hon. secretary, trained to Trowbridge, and then completed the journey to Edington by brake, via Hilperton and Steeple Ashton. Making a tour of Trowbridge, the town hall, the old church of St. James, and other features were inspected from the brakes. Arriving at Steeple Ashton—literally Staple Ashton—once a settlement of cloth manufacturers, a detour was made in order to examine the beautiful Late Perpendicular church which was erected at the end of the 15th century in part by two wealthy clothiers, Walter Lucas and Robert Long, the latter of the well-known Wiltshire family whose present seat of Rood Ashton is close by. The quaint old timbered houses, the Round House, and the column erected over two centuries ago marking the site of the old market cross in the village street, did not escape notice. On arrival at Edington Monastery Gardens, the Rev. E. C. Alexander, who acted as guide during the remainder of the proceedings, delivered an address. He pointed out that the founder of the monastery buildings was a native of the village, and known as William of Edington, who ranked among the great church-builders of the age, and whose life was almost entirely spent from 1341 in the public service. From the time of the Dissolution the monastery buildings fell into ruins, and were used by the villagers to build and repair their cottages. All that is now left is a massive stone wall. Mr. Alexander then conducted the party to the monks' fishpond. It is ½ acres in extent, having in the centre two shrub covered islands. Next the Church of St. Mary, St. Katharine, and All Saints was thoroughly inspected. Mr. Alexander spared no pains in pointing out the numerous interesting features. The famous Edington Church is one of the few perfect monastic churches in the country, and also of the types of the transition from the Decorated to the Perpendicular style. It is cruciform in shape, and has an embattled tower holding six bells.

THE BRITISH AND KENT ARCHAEOLOGICAL ASSOCIATIONS AT CANTERBURY. The seventy-first annual congress of the British Archaeological Association, which is being held in conjunction with the Kent Archaeological Society, opened at Canterbury on Monday, under the presidency of Mr. Charles E. Keyser, M.A., F.S.A. In the afternoon a party of about a hundred members visited St. Augustine's College, where the interesting ruins of the Abbey church of St. Peter and St. Paul and the Early Saxon church of St. Pancras were inspected under the guidance of the Rev. R. U. Potts, the sub-warden. The excavations on the site of the Abbey church, which have resulted in a number of interesting discoveries, are to be continued this autumn in the neighbourhood of the south transept, where it is expected to find the foundations of an apsidal chapel similar to that already uncovered on the northern side. The party were welcomed to the college by the warden, Bishop Knight, who was accompanied by Canon Mason. Subsequently a visit was paid to the historic church of St. Martin, the oratory of Queen Bertha, where the Rev. C. Evelyn Woodruff pointed out the special architectural features and objects of interest. In the evening the visitors attended a reception given by a local committee, of which the Dean of Canterbury is chairman. In his presidential address, delivered at the grand hall, Mr. Keyser advised the Kent Association's committee to keep a regular check on what was going on in the south-eastern part of the county. He shuddered to think of the possibility of their quiet and seclusion in the country parishes, with their old stone churches, many erected during the Norman period, becoming the centres of a growing mining population. On Tuesday the party proceeded by motor via Fernhill, Blandford, and Baringston to Dover, returning to Canter-

bury by way of Deal and Eastry. At the well-known little Norman church of Patricbourne the Rev. Hubert Knight called special attention to the beautiful Late Norman work over the main entrance. The tower is disfigured by ugly brick buttresses of comparatively modern date. Mr. Knight mentioned that much of the Flemish glass in the windows was brought over and placed in the church by a former Lady Conyngham in the 15th or 16th century. Barfreston Church is another small but extremely valuable example of Late Norman architecture. The moulding over the arch of the main entrance is considered to be the finest of its kind in the country. The church, which was restored in 1840, was stated by Mr. C. E. Woodruff to have been originally built like that at Patricbourne about the year 1180. The bell which used to hang in the roof now occupies a position in a tree outside the church, but is rung from the inside. The remains of the Benedictine Priory of St. Martin at Dover, visited under the guidance of the headmaster, and the refectory and the fresco of "The Last Supper" at Dover Castle were among the most interesting features. The Banqueting Hall, with its ladies' and minstrel galleries, proved a great attraction. The church of St. Mary in the Castle was described by General Sir Charles Warren, who drew attention to the pharos adjoining. An inspection (under the guidance of Colonel Kavanagh) of the church at St. Margaret's-at-Cliff, another good example of Late Norman architecture, closed the day's proceedings. On Wednesday the members visited Ash Church, the ruins of Richborough, and the churches and Medieval houses in Sandwich, the excursion ending with tea at Betteshanger, the seat of Lord and Lady Northbourne.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—The annual cricket-match between the Royal Institute of British Architects and the Architectural Association will take place on Wednesday, July 22, at the A.A. Ground, Edlestree. We are asked to request any members of the R.I.B.A. who would like to play to communicate with Mr. N. W. Hadwen, 22, Buckingham-street, Adelphi, W.C.

The technical institute and boys' secondary school at Woking, erected jointly by the urban and county councils, at a cost of £30,000, was opened by Lord Moulton on Wednesday.

The Hull Grammar School Committee have approved sketch plans prepared by the city architect for the extension of the buildings, including six additional classrooms, with a geography laboratory, a dining-room, a boys' library, and a common room.

Whitchurch volunteer and town fire-brigades and the Malpas fire-brigade were engaged several hours on Tuesday evening dealing with a destructive fire, which destroyed the works of Messrs. T. G. Huxley and Co., builders, Malpas. The flames broke out just as the workmen had left.

A Local Government Board inquiry was held at Hull on Tuesday by Mr. G. Pepler, into the corporation's first application to prepare a town-planning scheme. The land referred to in the application has an area of 913 acres, and is situated partly in the city and partly in the rural district of Sculcoates.

A select committee of the House of Commons passed on Wednesday, after nine days' inquiry, the Bill to amalgamate "the Three Towns"—Plymouth, Devonport, and Stonehouse. The scheme was opposed by Devonport, and, if adopted finally, it will be the first time a county borough has been joined to another against its will.

The annual excursion of the Northern Architectural Association will be held at Carlisle on Wednesday week, the 29th inst. The members to travel by the 10.20 train from Newcastle. The party will drive by motor to Rose Castle. The cathedral and castle at Carlisle will also be visited. The return train leaves Carlisle at 6.40 p.m.

The annual report of the Prabody Trust shows that the trustees now house over 22,000 persons, mostly labourers and charwomen, who have an average family income of £1 1s. 10d. a week, and who pay an average rent of 2s. 4½d. a week per room. Other dwellings are in course of erection at Vauxhall and Walworth, and a seven-acre estate is being acquired in Hammersmith.

Correspondence.

LICENTIATES AND THE R.I.B.A. CHARTER.

To the Editor of the BUILDING NEWS.

SIR,—A circular, evidently being sent to all Licentiates of the Institute during the past week, has been authorised by a group of Licentiates who have formed themselves into a committee, ostensibly for the purpose of petitioning the R.I.B.A. Council, and "if necessary" the Privy Council, with regard to Clause 2 of the proposed new Charter. An analysis of this circular will surely be interesting to the profession generally.

It is alleged that the Clause mentioned would operate unfairly to the Licentiates as a class, the particular grievance being that they, along with other architects (whose names will be admitted to the Register at a later date) will be styled "Registered" Architects, whereas Fellows and Associates (who are corporate members), the greater number of whom have qualified by examination, will be termed "Chartered" Architects. It is also claimed that the "status" of Licentiates will be affected and "their identity lost," owing to the fact that other Registered architects will be enrolled after the Charter comes into operation. Having this in view, one pauses to see the nature of their appeal, which amounts to nothing less than a demand that no distinction should be made between the Licentiate and Associate classes. The personal efforts, work, and expense entailed by those who have sought to qualify for admission to the Institute by examination shall be all to no purpose and of no avail. This body of Licentiates evidently does not recognise any claims of merit, but by some train of reasoning would seek equal distinction, for which they have "toiled not," etc.

It should be borne in mind that the petition does not take the form of a suggestion that all other architects enrolled after the Charter has been passed should be separately classed, although this is stated to be the ground of complaint. This appears to be far from the minds of the petitioners, as no mention of this is found in the circular. One can well imagine the feelings of those members of the Institute who have been successful in working their way patiently through the various examinations at this attempt to obtain, through a combination of circumstances, that which has hitherto been reserved for those who have cared to work for what has been considered to be the best distinction in architecture.

It will be noted that the two signatories to the circular have thought fit to qualify in engineering and surveying (being members of the Institution of Civil Engineers and Surveyors' Institution respectively), but not in architecture. It would be interesting to know how they would view an attempt by professional men outside these institutions to gain admission to the same, and then appeal to be given the same status as themselves. Such a proceeding would be exactly on all fours with the effort they are now engineering.

The appeal cannot be said to be in accord with the British spirit of fair play, and it is hoped that little support will be found for such an unworthy petition, which will, no doubt, receive the scant respect which it deserves at the hands of the R.I.B.A. Council.

We shall esteem it a favour if you can find room in your valuable paper for this letter.—We are, etc., FIVE ASSOCIATES.

ANOTHER GOOD MAN WHO PLAYS MANY PARTS WELL.

SIR,—We notice in a recent issue of your Journal that you draw attention to an instance of one man contriving in his own person to play many parts in local civic life. The gentleman referred to fills three posts, that of clerk, inspector, and surveyor of nuisances.

It may interest you to know that Mr. W. G. H. Browne, of Bolsover, has four posts. He is not only surveyor to the

council, sanitary and water engineer, and inspector under the P.H.A. 1875, but he is also captain of the fire brigade.

It is possible that some of your readers may know of a gentleman holding even more posts; but if so, he would certainly be an energetic man who would be able to give to all the attention that each deserved.—We are, etc., KERNER-GREENWOOD AND CO. King's Lynn.

PARLIAMENTARY NOTES.

THE GOVERNMENT HOUSING BILL.—In reply to questions on Monday by Mr. C. Bathurst and Sir A. G. Boscawen about this measure, Mr. Runciman explained that it was the intention of the Government that all the cottages provided should be let at an economic rent. Gardens would be provided wherever necessary; the size would naturally depend upon various circumstances, and he was not prepared to pledge himself to a minimum. A sum not exceeding £2,000,000 was proposed to be made available for the purposes set out in Clause 2 of the Bill, and when introducing the Bill he mentioned Rosyth only as one specially urgent case to be dealt with under that clause. The houses proposed to be erected at Rosyth would be occupied by Admiralty employees when the constructional work now in progress had been completed. A sum not exceeding £3,000,000 was to be made available for the purposes set out in Clause 1—that was to say, the provision of dwellings and gardens in agricultural districts. It was impossible to estimate precisely the number of dwellings which were required in agricultural districts, but he had no reason to think that the sum named in the Bill would be insufficient to meet the immediate demand.—Sir A. G. Boscawen: Do I understand that a sum not exceeding two millions is necessary for Rosyth and other Government factories, and that a sum not exceeding three millions is all that is required for the rest of the country?—Mr. Runciman: No, the hon. gentleman is not right in understanding that.—In reply to Mr. Lane-Fox, Mr. Runciman said that when the Government had obtained the necessary powers they would lose no time in making a start.

The Swansea Town Council decided on Wednesday to apply to the Local Government Board for sanction to borrow £101,990 for the erection of 500 workers' dwellings on the corporation estate at Town Hill.

Mr. A. O. Goodrich, vice-chairman of the London County Council, opened on Friday Fairfield-road elementary schools, Bow, E., which have been rebuilt at a cost of £19,000. The three-story building gives a total accommodation of 1,024 places.

The death is announced, at the age of 76, of Mr. Joseph Lockwood, master builder, of King-street, Boston, Lincs. For six years he was a member of the corporation, and he also served on the board of guardians, and on the Eastern Sea Fishery Board, and other public bodies.

The Portsmouth Town Council unanimously approved on Tuesday the scheme for the provision of a new road out of the town, which is to cost about £200,000. The scheme will now be submitted to the Road Board in order to secure what financial assistance is possible.

An appeal has been issued for a memorial to Sir Edmund Hay Currie, to take the form of a churchyard cross in the churchyard of Hindhead, where Sir Edmund is buried. A design has been made by Mr. Temple Moore, F.R.I.B.A., and will cost about £250 to £300 to execute.

The health committee of the Bradford Corporation recommend that application be made to the Local Government Board for power to borrow £168,000 for carrying out a municipal house-building scheme at Odsal, one of the out-districts of the city. Plans have been drawn, and the proposal deals almost exclusively with working-class houses.

The new block just added to the grammar-school at Oundle was opened on Speech Day. On the ground floor there are research, biological, and chemical laboratories, lecture-rooms, teaching-museum and agnaria; and on the second floor drawing-office, machinery hall, and standardising and physical laboratories. Messrs. John Thompson and Son, of Peterborough, were the builders.

Mr. C. G. Mason, A.M.I.C.E., who has been borough surveyor of Guildford for eighteen years, and previously served under the borough surveyor of Portsmouth, tendered his resignation to the town council last week. The matter was taken in committee, and was accepted. The council appointed a special committee to bring up a report as to the terms of appointment of his successor.

STATUES, MEMORIALS, &c.

A NORMAN SHAW MEMORIAL.—At New Scotland Yard, Victoria-embankment, on Monday afternoon, the Earl of Plymouth unveiled a memorial medallion to the late Mr. Norman Shaw, R.A., the architect. The medallion, which is of bronze gilt, is placed in the centre of the river front of the building under the middle balcony of the third floor. A portrait head of Mr. Shaw, to the scale of a 10ft. figure, occupies the centre, the head being surrounded by an oak leaf wreath. The inscription round the head reads: "Richard Norman Shaw, architect, 1831-1912." The medallion was designed by Professor W. R. Lethaby, F.S.A., and was modelled by Mr. Hamo Thornycroft, R.A. Sir Edward Poynter, P.R.A., presided at the ceremony. Others present included the Countess of Plymouth, Sir Aston Webb, R.A., Sir Thomas J. Jackson, R.A., Sir J. J. Burnet,

LEGAL INTELLIGENCE.

ALLEGED NEGLIGENCE IN SEWER-LAYING.—An action of interest to property owners and local authorities was heard at Wellington (Salop) County-court on Tuesday, before Judge Harris Lea. The plaintiff was George Jennings Huxley, commercial traveller, Sutton Coldfield, who sued the Wellington Urban District Council for £70 damages for alleged negligence in laying a sewer along an entry between the plaintiff's houses in Regent-street, Wellington. The five houses affected were purchased by the plaintiff for £550, and are let at rentals varying from 4s. to 5s. 10d. a week. In the early part of 1913, as a result of the Housing and Town-Planning Act, an inspection of the whole of the cottage property in Wellington was ordered by the local council. Plaintiff agreed to effect certain alterations to his houses. It was arranged that a new sewer should be put

KING EDWARD VII. MEMORIAL SANATORIUM IN THE VALE OF CLWYD: SELECTED DESIGN.

Building operations are to begin forthwith upon these buildings, which will be the principal sanatorium in North Wales. It is to form part of the Welsh National Memorial to King Edward VII. Mr. T. Taliesin Rees, F.R.I.B.A., architect, of Liverpool, was placed first in an open competition, and the plans so chosen have been adopted by the committee, with the result that now the estimate of Mr. James Merritt, of Birkenhead, for about £31,500, has been accepted

KING EDWARD VII. MEMORIAL SANATORIUM, NORTH WALES: SELECTED DESIGN. (GENERAL PLAN.)

MR. T. TALIESIN REES, F.R.I.B.A., Architect.

R.S.A., Sir Edward Henry, Mr. Ernest Newton, A.R.A. (President of the Royal Institute of British Architects), Mr. G. H. Tripp (Receiver for the Police), Mr. J. Dixon Butler, F.R.I.B.A., Mr. Gerald Horsley (past-President of the Architectural Association), Mr. F. A. White (hon. secretary and treasurer of the fund), and several of Mr. Shaw's pupils. Sir Edward Poynter, in opening the proceedings, referred to the charm of voice and fluency and felicity of words possessed by Mr. Norman Shaw and to his position as a public man and an artist. Lord Plymouth remembered that Mr. Norman Shaw played a very strong part during the latter years of the 19th century not only in the buildings he had left to us, but also in the influence he exercised upon those who were working in the architectural profession. He would not be misunderstood if he described Mr. Shaw's work as examples of the aristocracy of architecture. He not only had the genius of invention, the instinct for true proportion, and the feeling of dignity in architecture, but there was something more easily felt than described in his work, and that was the refinement which it never lost, however simple and however plain the design might be. His work showed the broad and cultivated mind directing the hand of the artist.

Mr. Thomas Stevens Geere, of Leytonstone, timber merchant, late of Stratford, E., who died on May 3, aged 90, left estate of the gross value of £56,681, of which £52,152 is net personality.

At the meeting on Monday of the town council of Walsall, the sewage-farm committee and the borough surveyor (Mr. J. Taylor) were congratulated on the completion of the new sewage purification works for less than £30,000.

Messrs. T. and G. C. Hirst, who have decided to build a tower to St. Mark's Church, Longwood, as a memorial to their parents, laid the foundation-stones of the addition on Saturday. Mr. O. White, of Huddersfield, is the architect.

in along an entry between two houses, and this was done. Plaintiff's contention was that the sewer was put in negligently, and caused the walls to bulge and crack. The council contended that the damage done was small, and could be easily put right. The buildings were fifty years old, and in a dilapidated condition. It was further asserted that there was no negligence on the part of the workmen, and that the cracks were made by vibration caused by the railway trains.—Mr. Wilson, one of the tenants, was called to give evidence.—Mr. George Riley, surveyor and engineer to the Urban Council, described what had been done under the Housing and Town-Planning Act to plaintiff's property. He estimated the damage at £5—His Honour gave judgment for the defendants with costs, and ordered that the £20 which had been paid into court be returned, as no negligence had been proved.

AFFAIRS OF A HEREFORD BUILDER.—At the Hereford Bankruptcy Court on Tuesday Richard Langdon Friend, builder, of Victoria-street, Hereford, came up before the Registrar, Mr. Carless, for his public examination. His gross liabilities amounted to £2,072 19s. 4d. expected to rank for dividend £717 9s. 6d., £610 of which was due to seventy-six unsecured creditors. His assets amounted to £180 5s. 2d., and there was a deficiency of £537 4s. 4d. Debtor attributed his insolvency to insufficient work and low prices. The examination was adjourned.

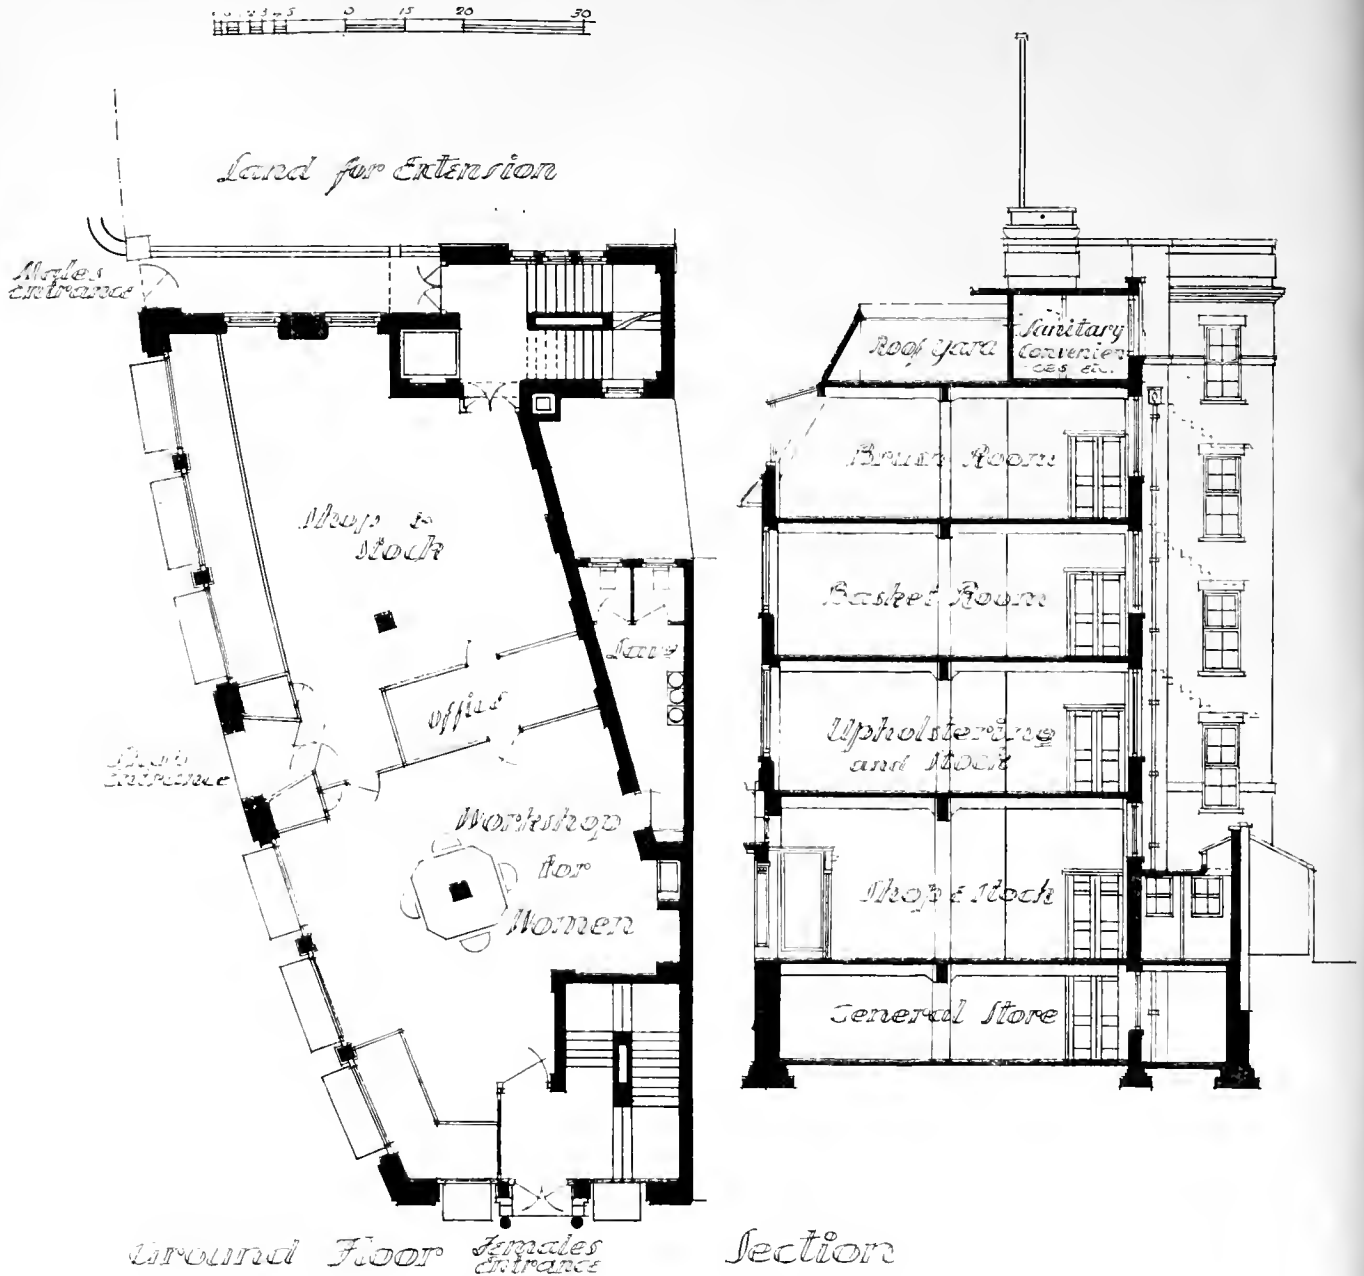

The wallpaper manufactory of Messrs. F. W. Howarth, at Blackley, Manchester, was completely destroyed by fire on Friday, the damage amounting to over £60,000. Two firemen were killed, owing to the collapse of a wall.

Mr. George Winch, of St. Elmo, Calverley Park-gardens, Tunbridge Wells, who died on February 22, left the statue of "My Dainty Aerial," by Henry Hugh Armistead, R.A., to the trustees of the National Gallery, to be placed in the Tate Gallery.

in respect of the first section of the scheme. The site is an ideal one, being surrounded by some of the loveliest scenery in North Wales, and situated at Llangwyfan, in the Vale of Clwyd, some three miles from the town of Denbigh. The land, about 250 acres in extent, was selected by the committee of the Memorial Association, and was acquired by Mr. D. S. Davies, Plas Castell, Denbigh, at a cost of over £5,000, and presented by him as a gift to the Association, in memory of his father-in-law, the late Mr. Thomas Gee. The present plans provide for eleven blocks of buildings—five for administration purposes, including a detached residence for the medical superintendent, and six wards all connected by covered ways, for the accommodation of patients. As a first instalment beds will be provided for 154 adults and 30 children; but when complete the institution will accommodate 284 patients. The buildings of this self-contained institute will be of substantial brick construction, and will be carried out and equipped according to the most up-to-date sanitary and curative knowledge. The institution will be to an unusual degree self-comprised, having its own reservoir for a water supply and its own electric plant for lighting and heating. Part of the land will be farmed for the benefit of the sanatorium, and new farm buildings are to be erected. Other portions of the surroundings will be laid out ornamentally, and made available for the recreation of patients and for light work, when such may be medically recommended.

DOWNING COLLEGE, CAMBRIDGE.

The drawing reproduced today is in this season's Royal Academy Exhibition. It shows the new extensions to this college by

WORKSHOPS FOR THE BLIND, BOLTON.—Messrs. BRADSHAW, GASS, and HOPE, Architects

Mr. Cecil G. Hare, architect, Gray's Inn-square, and the design, though given an individuality of its own, has been made to conform as far as circumstances allow, with the existing buildings of this college. The facings throughout are of stone, handled in the manner of the Late Renaissance.

WORKSHOPS FOR THE BLIND, BOLTON.

This building is erected in a central position in the town, and was opened by Mr. C. Arthur Pearson, the treasurer of the National Institute for the Blind, last May. The ground floor is used as a saleroom for goods made by the blind workers, and for women's workroom, the upper floors being used for men's workrooms, while on the roof is an open yard, with sanitary conveniences and shelters. As there are many workers with a little sight, the rooms are all made with a large proportion of window to floor space—25 per cent. on each floor. Reinforced concrete construction is used throughout for both floors and roof, and executed by Stuart's Granolithic Company, the general contractor being Mr. R. J. Tyson, of Bolton. Messrs. Bradshaw, Gass, and Hope, of Bolton, are the architects.

THE BANK OF VICTORIA, LIMITED. LXIX, KING WILLIAM STREET, E.C.

This building is now being built for the Bank of Victoria as premises for the London

Branch of their business. They at present occupy offices on the opposite side of the street. The front is of Portland stone, with a base of Aberdeen granite. Inside, the main office on the ground floor will be panelled in oak. The builders are Messrs. Patman and Potheringham, and the fireproof floors, etc., are being erected by Messrs. the Kleine Patent Fire-Resisting Flooring Syndicate, Ltd., and Mr. O. P. Milne, F.R.I.B.A., of London, is the architect.

DETAIL OF TOWER AND STAIRCASE AT BANKSIDE END OF ST. PAUL'S BRIDGE.

The view which is given here is reproduced from the third perspective submitted by Mr. Edward R. D. Selway, who won the third premium of £100, and it serves to more fully illustrate the accompanying capital sheets of details to which we particularly alluded when we reviewed the competition designs on June 26 last. These geometrical drawings show the stairways on the Surrey side of St. Paul's bridge leading down to the proposed Embankment, and the obelisk towers rising above these stairs are intended to serve as pylons in the general contour of the design. This completes our series of illustrations from this competition. Our previous ones will be found in the BUILDING NEWS for June 26, July 3 and 10.

CHIPS.

Mr. Thomas Newbigging, of Woodgarth, Knutsford, the well-known consulting gas engineer, who died on June 1 last, left estate of the gross value of £28,903, of which £28,800 is net personality.

At last week's meeting of the City Corporation sums amounting to £37,000 were voted for acquiring interests in property numbered 50 to 68 required for the widening of Leadenhall-street. A plan for disposal of the surplus land by public auction or private treaty was also approved.

Plans for an elementary school to accommodate 260 girls in connection with Holy Trinity Church, Halifax, intended to be erected in West-parade, have been approved by the Board of Education, and also by the local education committee, and the works are intended to be commenced forthwith, as soon as the full particulars are ready. The architect having the work in hand is Mr. Lister Coates, A.R.I.B.A., of Central Chambers, Halifax.

The council of the Zoological Society have decided to carry out this autumn a long-contemplated improvement at the gardens. Plans have been prepared, and a tender accepted for the construction of a second tunnel under the Outer Circle roadway. It will be placed near the main gate under the end of the Western Aviary, and will be both higher and wider than the existing tunnel. The contract has been given to Messrs. D. G. Somerville and Co., of Westminster, who built the Mappin Terraces. The clay that is excavated will have to be removed by canal barges.

GUINEAS FOR BEST REPLIES.

We offer a prize of one guinea every week for what we deem the best reply to any query appearing in this column, which we deem worth insertion.

Replies must be sent in over real name and address. No others can receive a prize. The Editor's judgment is final.

This competition is restricted to buyers of the paper, and with each reply a coupon cut from our front page must be enclosed.

Any number of replies can be sent, but a coupon of this date must accompany each.

All else being equal, brief replies will stand the best chance. We emphasise this, as some correspondents ignore the fact that querists want terse facts, not long essays. Any necessary illustrations must be in line only—no tints or washes—and about twice the size they are meant to be reproduced. We are unable to avail ourselves of replies that contain illustrations unless we receive them by first post on Tuesdays.

The right to withhold the prize in the event of no reply being received worthy of it is reserved by the Editor, who also claims the right to publish any other replies he may deem useful.

We award the guinea to Mr. James Murphy.

QUESTIONS.

[13146].—STRESSES.—Can the "method of sections" be employed to determine the stresses in four bars of a

roof, as shown by dotted lines on enclosed sketch? If so, what would the formula be?—Sections.

REPLIES.

[13145].—BANANA STORE.—For a store for bananas there is nothing better than a light timber framed structure, erected on a concrete base, the sides and roof being finished with "Ruberoid," or any such like material. The store should be 10ft. by 8ft., and 8ft. 6in. high, internal dimensions, the annexed diagram show-

ing construction, which consists of a 4-in. concrete base, returned and weathered at a curb externally around the entire building, upon which is erected the shed in the usual manner of quartering, the roof of rafters, the eaves finished with fascia and half-round gutter and 2in. down pipe. The inside should be lined with Willesden paper. A ventilating space of 12in. is formed around the building just below the head, this opening being filled in with fine gauze. A few ventilating panels of similar construction are inserted in the framing 12in. above floor level. The concrete floor is finished by covering it with felt and battens. An arrangement of bamboo sticks fixed lengthwise and vertically to the framing are fixed for hanging the clusters of bananas. Salesmen that have had these stores erected find that a covering as mentioned is far more economical and satisfactory than boarding, &c., owing to its damp and vermin-proof properties.—Chas. S. Longley, 52, Ivanhoe-road, Denmark Park, London.

[13145].—BANANA STORE.—The following sketches denote how the leading banana store in this district is arranged, with notes thereon, and how the same is supervised with excellent results. The fruit is stored, as shown, on ground and first floors, and brought forward in three stages for ripening, as indicated on plan. The stores are gas-heated with No. 4 large Bunsen

Barometer

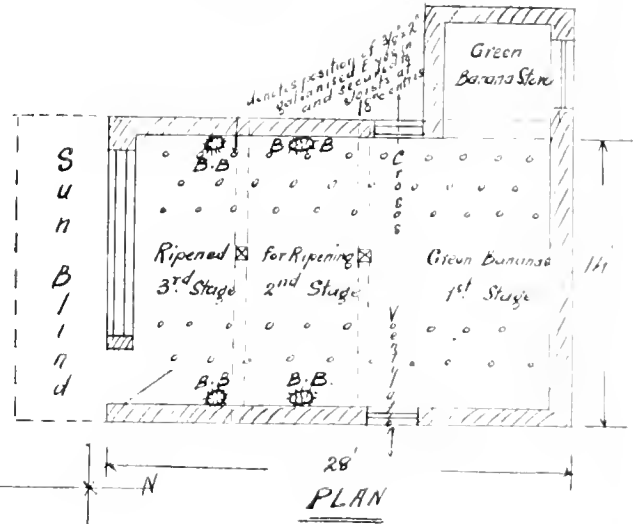

burners for winter, damp and cold weather, and also partially for summer, with sun-blind in hot weather for regulating the heat, which said heat and expert ripening is controlled by three barometers (as per sketch), one placed in each stage, combined with practical experience.—James Murphy, 15, Seaford-road, Seaford.

[13145].—BANANA STORE.—"Jamaica" does not mention if the store is required at home or for the temporary storage prior to shipment. To deal with the former, the clusters of fruit, which weigh about half a hundredweight apiece, are landed in a green state, and it is for the merchant to ripen them off as required to meet the demand, and this requires considerable care. A special thermometer is made for this purpose, which has in addition to the readings of the degrees as follow:—50°, too cold; 60°, slow; to keep; 65°, medium; 75° and 80°, to ripen quickly, and 100° too hot. The chambers require to be kept dark and ventilated, the size naturally depending upon the stock held. The fruit should be hung up by means of stout rough twine to hooks in the ceiling, or, preferably, to special beams on iron runners, similar to those used by butchers, with double lock in double rows, with a gangway between for inspection. By using the twine it is possible to turn a cluster round to see how far the ripening process has gone without removing from the hook, or lifting the cluster up. By taking the weight of a cluster at 50lb., and those exported are generally of that weight, although they have been known to reach as much as 80lb., one can calculate the total weight of one row. It is better to have only one cluster in height, and that at about eye-level for easy watching, also on account of lifting one over the other. Taking 100 clusters to require about 250ft. super, including gangways, the size of the store can be determined. When this is settled, the strength, or, in the case of existing premises, additional strength of the runner, beams, &c., can be worked out. It is better to have a store for keeping (60°) and another for ripening (75°), with facilities for cooling or heating in summer or winter by means of a small ice box and hot-water pipes from, say, a gas radiator.—K. H. Read, Lecturer on Building Construction, Gloucester Technical School.

The York-hire Federation of Building Employers held their delegate meeting at Ratley Town Hall on Friday, and were welcomed by the mayor. The delegates had tea at the Wilton Park Mansion House.

The Le Brun Prize of 1,000dol., entitling its holder to a year of travel and architectural study in Europe, has been awarded to Mr. John R. Lautenbach, of New York. The award was made as the result of a competition, the subject of which was "The Embellishment of Columbus Circle."

The town-council of Edinburgh have intimated their intention of applying for authority to prepare a town-planning scheme for an area of land in the Alcorn, Duddingston, and Niddrie districts, in accordance with the provisions of Part II. of the Housing and Town-Planning Act, 1909.

Our Office Table.

At the meeting of the Westminster City Council yesterday (Thursday) the general purposes committee submitted a recommendation that they be authorised to negotiate for the purchase of the Westminster Hospital site for new municipal buildings, and make a definite offer therefor. The agents to the hospital authorities had informed the committee that they had been authorised to offer the site to the council at a certain sum. This sum, however, the committee were not prepared to recommend the council to pay. The finance committee reported that they also had considered the matter in its financial bearings, and submitted an estimate of expenditure of £250,000 for the site and building, to be chargeable to capital account. Reporting on the subject, the general purposes committee pointed out that it had long been felt that the accommodation at the City Hall in Charing Cross road is not sufficient for the council's purposes, nor is the site of Caxton Hall large enough to provide the required accommodation. The Westminster Hospital site, however, is regarded by the committee as eminently suitable for municipal purposes. With regard to the cost of the scheme, estimates and a report had been submitted, from which the committee were satisfied that, if the whole cost of purchasing the site and erecting the new building was raised by loan, repayable with interest by yearly instalments spread over a period of years, the rents from the existing halls would cover most of the cost of the site and buildings, and only a fraction of the cost would have to be met out of the rate. The report and recommendation were adopted *in camera* for an hour, and for a moment at the close it was announced that the motion of Mr. Spicer, Clerk, was carried. Mr. Gatti, the reporter, then had been referred back to the General Purposes Committee to reconsider and report upon.

Counsel have been consulted with reference to the powers of the City Corporation to purchase so much of the undertaking of the City of London and Charing Cross Electric Light Companies as relates to the

City. The late Mr. Danckwerts, K.C., and the Law Officers of the Corporation were of opinion that the power to purchase could be exercised during the six months following August 18 next, or, if not then exercised, within the six months following August 18, 1924. On the other hand, Sir Robert Finlay, K.C.; Mr. Cave, K.C.; and Mr. Tyldesley Jones, whom the companies consulted, held that the Corporation would have no right to purchase the undertaking if it failed to take the necessary steps within six months from August 18 next. The Corporation have been advised by their Streets Committee that it is inexpedient to exercise the powers either this year or next.

A Select Committee of the House of Lords has passed the Middlesex County Council's Bill to authorise the construction of a road five miles long and 80ft. wide from Chiswick to a point of junction with the Bath road at Hounslow, giving a new route to the West of England, and relieving the congestion of Brentford High-street. Clause 25 of the Bill enables the county council to require motor-omnibus companies to give them access to their books and to make returns of the mileage run by their cars on the new road, and to charge the companies three-eighths of a penny per car mile towards the expense of maintaining the road. This clause, which has already passed the House of Commons, was strongly opposed by the Motor-Omnibus Owners' Federation, who will attempt to have the Bill recommitted. The clause should it receive the Royal Assent, will in effect afford statutory recognition to a far-reaching principle, as it invokes the liability of motor-omnibus proprietors to contribute to the upkeep of the roads they utilise, and so relieve the ratepayer, in part at least, of an ever-increasing charge. It will be noted that during the inquiry the surveyors to the borough councils of Fulham and Marylebone supported by evidence the allegation of the companies that motor-buses did not inflict special damage on a well-made road with a wood-block surface, and that, therefore, the proposed charge could not be justified.

At the meeting of Northamptonshire County Council, on Thursday in last week, Mr. C. S. Morris, the county surveyor, submitted his annual report on the roads. The time is rapidly approaching, he stated, when the present system of maintenance—i.e., recoating short lengths on every road each year—will have to be discontinued and a new system adopted of recoating each road from end to end as and when required. The total cost of maintenance will probably be cheaper when the bulk of the materials is concentrated upon certain roads each year instead of being spread over the whole mileage, as at present. The traffic of the present day will, ere long, Mr. Morris believes, demand the application of the principle to the whole of the main roads. From a traffic point of view there is, he points out, a distinct advantage in having the whole work of renewal of each road carried out in a given year with no further obstruction by repair operations for several subsequent years, in addition to the truer and continuous surface which can be obtained and maintained by this method. The total cost of the maintenance of the work upon the roads last year was £41,665 5s. 4d.

The Ordnance Survey Department are erecting a number of permanent bench-marks throughout the United Kingdom. They are erected in circles at not less than twenty-five miles apart. One has been erected on the roadside in the parish of Bulmer, about 200 yards east of the village. The old style of bench-marks have been found unreliable, and after experimenting the Government Department decided to substitute granite pillars bearing levelling datum which would enable them to arrive at a fixed level. The granite pillar bears a brass pin, on which a record of the sea level will be inserted by the engineers on inspection and survey.

Mr. Banister Fletcher, in a criticism of the designs for the improvement of the Guildhall, states that if the Guildhall Yard is altered in the manner projected it will be nothing short of an architectural misfortune. His

main objection to the treatment of the Guildhall façade is the prolongation of the eastern wing of an archway across the street known as "Guildhall-buildings," which would incorporate the length of the Irish Chamber in the new eastern façade. The treatment of these façades and the proposal to lengthen the eastern portion would entirely destroy the symmetry of Guildhall Yard by making it into a lop-sided court, with an eastern wing 55ft. longer than the western wing. This, he declares, would be an architectural blunder, for, while spoiling the symmetry of Guildhall Yard, it would connect the principal entrance of the Guildhall of the City of London to a block of office buildings, now occupied by the Automobile Association, adjoining a public-house! The lengthening of the eastern wing would not only destroy the symmetry of the courtyard, but, by reason of its length and imposing architectural treatment, also detract from the present importance of the central entrance portal leading into the Guildhall.

Sir Charles Holroyd, in an address at a Lyceum Club dinner on Monday, on Italian art, said that painting remained more in Italy than in any other country, and would remain there for ever. Italian painters had a directness and simplicity of style unmatched in Europe out of consideration for others, and a more graceful and flowing manner than any other race in Europe out of consideration for themselves. Dürer never quite got rid of his hard German manner, and Rubens never got rid of his Flemish superabundance and roundness. Raphael knew how to be soft in outline without hardness, and round in form without being superabundant. The words that best expressed the quality of Italian painting was graciousness. How did he, a North-country coal-miner, come to love Italian art? First, he went through all the stages of the artist's education. Then he came up to London and studied at the Slade School. Here he read Vasari, the Bible of art, and had never stopped reading him. Then he got a travelling studentship and went to Italy for two years. He got to Milan, but it was not Italy, but Cisalpine Gaul. Afterwards he visited Florence and Rome. By studying church mosaics at Rome in the order in which they had been done he acquired an extraordinary knowledge of Roman churches, and he advised others who had the time to follow the same method.

At the rooms of the Society of Antiquaries, Burlington House, on Monday, objects discovered at Antinoë and Abydos during the past year were exhibited. The work at Antinoë is most largely represented, and the finds throw considerable light on the life of the inhabitants of the town, especially during of the fifth and sixth centuries A.D. The bulk of the papyri discovered is in Greek, but a few are in Latin. One valuable find was a number of pages of Theocritus, dating from the fifth or sixth centuries A.D. This is practically the only example of a Theocritean MS. which Egypt has yet provided, and it is at least seven centuries earlier than the earliest Mediaeval MSS. Shorthand appears to have been in existence in those early times. One fragment not only gives a Latin alphabet with the letter names in Greek, but lists of words with their shorthand equivalent. Particularly valuable also are a number of Coptic woven tapestries which date from the third to the seventh centuries. Some pieces of woven silk must have been among the earliest that occur either in Europe or Egypt. They are supposed to date from the sixth century, and silk was only introduced into Europe from China about 550 A.D.

At Messrs. Knight, Frank, and Rutley's sale on Wednesday of Early Georgian fittings in the old residences in Argyll-place, by order of the Westminster City Council, the carved panelling to walls on the first floor of No. 6 realised 54 guineas; a massive chimney-piece, white marble, inlaid with Irish green, 41 guineas; a similar lot, 40 guineas; a carved wood mantelpiece, with marble slips and iron grate, in No. 7, Argyll-place, £50; three six-pannelled doors, with carved mouldings and

Georgian door-heads, £53; a white marble mantelpiece, with carved frieze and caryatid jambs, £168; a white marble mantelpiece, with carved frieze, inlaid with green marble, with open grate, 70 guineas; five six-pannelled doors, with carved egg-and-tongue mouldings and architraves, and three overdoors, 43 guineas; five panelled shutter linings, with carved mouldings and architraves, £27.

It has been decided to hold a national service for Freemasons in St. Paul's Cathedral on Thursday afternoon, October 22, in aid of the fund being raised for the preservation of the fabric of the Cathedral. Sir Christopher Wren is traditionally believed to have been the Master of a Lodge consisting of operative masons engaged in the construction of his great masterpiece, and it is felt that Freemasons would welcome the opportunity to associate themselves with the endeavour to preserve a building of such national importance and interest. The Pro-Grand Master, Lord Amphil, has expressed his intention to be present at the service officially. A sub-committee, consisting of the Grand Secretary (Sir Edward Letchworth), the President of the Board of General Purposes (Mr. Alfred F. Robbins), the Grand Director of Ceremonies (Mr. J. S. Granville Grenfell), the Rev. W. P. Besley (Past Assistant Grand Chaplain), Mr. W. Resbury Few (Assistant Grand Secretary), Mr. G. T. Lawrence (Master of the Cathedral Lodge), and Mr. Vernon Taylor (Past Deputy Grand Organist), has been formed to arrange the details of the service.

After a keen debate the town council of Wolverhampton adopted on Monday a report by their housing committee recommending the erection of workmen's dwellings in the borough. A site in Green-lane, containing an area of 3½ acres and 15,545 square yards, acquired at a cost of 1s. 4d. per square yard, has been considered suitable, inasmuch as it lies in a healthy area on a high elevation and is centrally situated. Plans prepared by the borough surveyor and approved by the committee show there is sufficient land available for ninety houses to be erected in blocks of not more than six. The scheme will be commenced by the erection of sixty houses. There will be thirty-eight of the smaller-size dwelling, with two bedrooms, and twenty-two of the larger size, with three bedrooms. A rental of 4s. 6d. a week in respect of the twenty-two houses containing three bedrooms, and 3s. 9d. a week for the remaining thirty-eight houses, will be fixed. The estimated cost is £187 each for three-bedroomed houses and £160 each for houses of two bedrooms. The purchase money to be paid in respect of the land is £1,845, and the cost of the erection of the sixty houses amounts to £10,186, making a total capital expenditure of £12,031. The financial statement prepared by the borough accountant indicates a debit balance of £187 to be met out of the rates.

"Evenings by the Sea" is a new handbook just issued by the Great Eastern Railway to the evening attractions and amusements of the twenty seaside resorts served by the company. It is finely illustrated with numerous facsimile water-colour sketches. Copies can be obtained free by sending a postcard to the Superintendent of the Line, Liverpool-street Station, London, E.C.

Part III. of Vol. VII. of the Transactions of the St. Paul's Ecclesiological Society has just been published for the society by Messrs. Harrison and Sons, 45, Pall Mall, price 5s. It contains architectural descriptions of the City church of St. Mary-le-Bow and St. Mary Abchurch, by Dr. Philip Norman, and another of Much Hadham Church, by Mr. A. Whitford Anderson, A.R.I.B.A., of Watford. Mr. F. C. Eeles writes on two 16th-century pontificals used by suffragan bishops in England, previously unrecorded, and raising the number known from two to four. The Rev. J. Kestell Floyer gives particulars of a Norman prayer guild, discovered by him and Mr. Sydney Hamilton while compiling the calendar of the Worcester Cathedral manuscripts. A MS. Book of Hours, written in France for an unidentified Scottish lady, about the middle of the 14th century,

GLAZED BRICKS.

HARD GLAZES (PER 1,000).

Table listing glazed bricks with columns for White, Ivory, and Buff, Cream, Other, and Second Best. Includes items like Stretchers, Headers, Quoins, Bullnose, and Double Stretchers.

SESSIONAL TESTIMONIES OF STUDY AT THE ARCHITECTURAL ASSOCIATION.

In the large studio at Tufton-street, Westminster, where the prize-giving took place last Friday, a big display was made of the drawings gathered together in Paris for the recent Exhibition of British Architecture, in illustration of students' work in this country. In our issue for July 3 we gave a brief description of these, and, therefore, need say no more in regard to them now. The current work in the architectural schools at Tufton-street filled the ground floor and two galleries of the Architectural Museum, and the Elementary Studies were on view in the top studio. With so vast an accumulation of sketches and designs it is impossible to do more than refer to a few of the more notable examples, and these are comprised by the testimonies of study shown by the more advanced pupils, and their drawings are, for the greater part, signed by Mr. Ernest Newton, A.R.A., the examiner.

The subjects vary, of course; but, generally they include a small Municipal Building or Council Offices, a Town Church Tower in the style of Sir Christopher Wren, a Town House, and a Concert Hall. We may refer to these essays of design in the order in which they are exhibited, and it is not our purpose to adjudicate upon their various merits. Indeed, without a more complete representation of the several proposals it is not possible to do more than make a few notes upon the precise drawings selected for this typical assemblage. Commencing on the first gallery, we begin with Mr. B. George, whose municipal offices block, carried out in the Doric order, has a good and quiet treatment without undue effort; but it might have improved the façade had the pilasters at the extremities of the colonnade been made much wider, so as to have enclosed the composition better. The Ball-room is an isolated building something like the familiar form of orangery, with big fenestration and a touch of the Bros. Adam in its design. The same subject by Mr. J. A. C. Tayler, for a municipal building, is accompanied by the plan displaying an inner area for light. This student's ambitious detail of the reception-room fireplace is very weighty with its overmastering pediment and restless sculpture. A pair of full-length draped figures stand upon the chimney-piece as supporters to a mural painting as an overmantel. Mr. W. T. Ching shows a chimney-piece for the reception-room of the municipal building, which is less dis-

cordant; but we prefer his recessed sarcophagus monument design, set in a recess behind a colonnaded front of rather nice proportions.

The quiet and discreet-looking Town-House front sent in by Mr. H. F. Gessling is refined and neatly drawn out on historical lines. The municipal offices by the same hand deserves similar approbation; but, perhaps, it might be said that the elementary simplicity of the side wings insufficiently supports the pedimented centrepiece, and suggests the idea that it is too ambitious for so small a block handled in a small way otherwise. The plan is sacrificed to corridors, areas, and stairs, and the lay-out is pinched in appearance. Mr. D. C. L. Derry delineates in a capable way, but his fancy for the brush is apt to carry him away, as in the study which gives a tower and side of a church, after the manner of Gibbs in elevation, set in a sort of Italian town, with the picturesque street in perspective having nothing in common with the special purpose of the drawing. Mr. Derry's stone-fronted Town House is self-contained, elevationally on old lines, with a tendency to recall Mr. Lutyens's work, and that, no doubt, is a good example to follow. The much wider scheme for a town residence, submitted by Mr. J. Burford, is difficult to compare, as it is bigger, though equally plain. The ground floor fenestration below the massive stone balcony seems needlessly tall, but as a whole the detail is consistent and constrained. The plan is commodious, and might be made to work out well by further study. The Pompeian decoration for a cortile is very sketchy, and the architectural proportions are not particularly happy. The raking cornice, following the idea of three pediments jostling one another, makes Mr. Burford's Municipal Offices façade look restless, and it is commonplace.

Messrs. T. C. Evans and P. Butt are content with a pair of drawings each. They are painstaking, and adepts at the art of stripping up like coffee-grounds effect of staining, so as to bring out the whites left in the plans; but adroit as all this may be, it does not mean fine architecture. As it happens, the measure shown belongs to the platitude of Coutts' Bank in the Strand. Mr. C. J. Brooks, or as he is designated on this occasion, "The incomparable Brooks," certainly ranks among the most attractive exhibitors in this gallery. His confreres, who esteem him so highly, have thus labelled his exhibit. His town house is unexceptional as an edition of Smith-square-like modern domestic work done in stock purple bricks or malms on Georgian lines, which are good enough, no doubt.

His plan is not very workmanlike in its lay-out. The Ionic Order is chosen by Mr. J. H. Jacob for his Municipal Offices, and his result is consistent and inoffensive. This design is more commendable than the author's Cinematograph Theatre, but too much valuable space is devoted to the central cortile and staircase. The council chamber is on the front overlooking a vast square. In all these students' competitions their enterprise is seldom, if ever, restricted by site limitations, and cost is scarcely a known quantity.

Several of the students had one restricted site, anyhow, this year, as a lighthouse on a sea-bound rock formed one of the subjects. Mr. R. A. Duncan's scheme for this is not simple enough, and florid detail and carvings are out of place midst the wildnesses of cliffs and the ragings of a storm, with sea surf scattered round. This contributor's public offices building is very different to the others, and has a long plan with dark passages in the wings. His elevation appears somewhat stilted in its proportions. Mr. W. S. Forbes is represented by a forceful set of highly-coloured sheets and a flamboyant ceiling, heavy in detail, though rich in effect, is to be noted as one of the striking exhibits on view. The first floor of Mr. Forbes' municipal buildings is not economic of administrative space, one of the first essentials in direct contrivance, and in the absence of the ground plan we do not know how the entrance is managed, because the elevation does not show the portals. The Council Offices, by Mr. J. M. B. Walsh, bear evidence of taste and study. The handling of the reception room fireplace is quite one of the best examples illustrated, and the drawings are spirited and feelingly expressed. The Town Offices, by Mr. A. B. Hamilton, on the ground floor gallery, look rather like an early 19th century hospital frontispiece, with a brick and stone well set out regulated pediment of the very late school. Mr. K. Takekoechi sends a good detail of a stone-pilastered Town House elevation, but his portico to the municipal buildings ranks as a capable study to ample scale, with big Ionic caps and fluted columns boldly drawn and strongly handled as a student's proposal. Mr. G. Shonstone also is to be commended for his work.

ANNUAL PRIZE DISTRIBUTION AT THE ARCHITECTURAL ASSOCIATION SCHOOL.

The annual prize-giving and exhibition of work by students in the Architectural Association School of Architecture took place on Friday afternoon at the headquarters, the Royal Architectural Museum,

Tufton-street, Westminster. There was a numerous attendance of ladies and many architects, and, as is customary, the students attended in full force and vociferously cheered the prize-winners. The eulogistic allusion by the chairman to the head-master was received with hearty applause. The chair was occupied by the President, Mr. Maurice E. Webb, who observed that before proceeding to the business of the day, he had a very sad announcement to make, that of the unexpected death of their friend Mr. F. Dare Clapham, a member of Council, which occurred that morning. Mr. Clapham was deeply interested in the welfare and progress of the Association, and was a great favourite with all; his death would be deeply regretted. Now he must pass on to a very pleasant duty, that of giving a brief account of the work of the schools during the past year. Hitherto it had been the custom to announce the award of prizes in July and to give them in October, a proceeding which was apt to damp the enthusiasm of everybody concerned. This year the Council of the Association had decided to announce the awards and give the tangible results on the same day. The past twelve months was the first year in which the headmaster, Mr. Robert Atkinson, had had complete control of the whole school. He thought all those who had seen the drawings now exhibited on the walls of the museum galleries would agree that he and the able staff of masters under him were to be congratulated on the results. The competition for all the important prizes and studentships in the Day School had been very closely contested, and in the case of several of them the result was in doubt up to the last subject set. Mr. Atkinson had the rare gift of being able to impart his knowledge to others. His enthusiasm for architecture was unbounded, and unsurpassed by any of his pupils, although it was understood that he occasionally had to refuse to keep an all-night vigil at the school while they were working out a design. Under Mr. Atkinson's guidance the school had had a most prosperous year in point of numbers and keenness for the work. They had had during the year sixty three men in the Day School and thirty in the Evening School. They could, if they would, advertise, like certain celebrated newspapers, the largest circulation (of budding architects) in England; but size was not the principal object. What the A.A. Council set most store by was the fact that they were the only architectural school in England which ran a full three-years' day-school course, managed entirely by architects for architects, without outside interference or control. The leaders of the profession entrusted their sons to the school's care for three years, and that, he thought, was sufficient proof that the school was—he would not say as good as it could be, but as good as there was. It was a somewhat curious fact that the council which controlled the destiny of the school was, and always had been, composed of the younger men of the profession, and in that fact lay, he believed, its success. In spite of this, he believed the members of the council were looked upon by the men in the school as old fogies, and the students were fully of opinion that they had forgotten more than the council ever knew! Perhaps that was so; but the council believed they occupied the half-way house between youth and age, and they tried to keep in touch with the new ideals and enthusiasms of youth without forgetting altogether to pay heed to the advice of the older, wiser, and perhaps sadder, members of the profession, who were always ready to give their help and assistance when asked for it on questions of policy for the school. In addition to the support of the profession they were now, through the energies of the registrar, in touch with all the public schools, who were sending them men every year. No longer was the career of an architect looked upon by the masters of public schools as the last refuge for a boy who had no other bent. He might mention in passing that the Public Schools Art Exhibition would be held in the autumn. Next year, if their numbers went on increasing as they appeared likely to do, they would be crowded out of that building. Already he

saw signs of the room devoted to council meetings becoming a Life room, with the model on the table where the minutes now lie; their meeting room was being turned into a studio, and the museum—that desperate refuge of the unwashed casts—was becoming a schoolroom. Extensions were, in fact, badly needed, and the money with which to make them was still more urgently wanted. At present every penny they had was spent on education, and all of it, amounting to some £6,000 a year, was subscribed, in one way or another, by the profession. The Evening School, an important branch of the work, would this year have to be reorganised, owing to the resignation of their master, Mr. James Buyers Scott, who had felt compelled by the cares of a growing practice and the addition of a wife to his responsibilities, to give up his work at Tufton-street, where he had been master in the Evening School for some five years. Mr. Robert Atkinson would take charge of that school, assisted by Mr. Robertson, an old Day School student, who had since worked for six years in Paris, gaining the highest honours open to an Englishman. The school would be in future organised on the basis of a designing club, and would be managed by a committee of its own members. A large studio would be placed at its disposal, where monthly designs would be worked out, occasional friends at the Wells-street atelier. He hoped that those of the present third year who were not going on to the Academy schools would avail themselves of the opportunity of continuing their work under Mr. Atkinson for a further period. Two pleasant tasks still remained to be accomplished. First, to congratulate Mr. Hepworth, an old A.A. Schoolman, in the name of the Association, on winning the English Prix de Rome with a very fine set of drawings; and, secondly, to introduce to them Mr. Herbert Baker. In welcoming Mr. Baker they were proud to see one of the outstanding personalities in our day's architectural world, an architect who, not satisfied with designing most of the modern houses in South Africa, the great memorial to Cecil Rhodes, and the new Public Buildings in Pretoria, had found a further outlet for his energies at Delhi.

Mr. Baker, who was most cordially received, then distributed the prizes, in accordance with the following list, the names being announced by Mr. H. M. Fletcher, the Hon. Sec. of the A.A.

LECTURES.

Greek and Roman Architecture: Book Prize, D. S. Glover.
Elementary Physics: Book Prize, D. S. Glover.
Elementary Construction: Book Prize, D. S. Glover.
Renaissance Architecture: Book Prize, S. F. Irwin.
Materials: Book Prize, M. D. N. Koch.
Intermediate and Advanced Construction: Book Prize, A. B. Hamilton.
Hygiene: Book Prize, James Burford.
Timber and Steel Construction: Book Prize, R. A. Duncan.

EVENING SCHOOL.

First Year.—Book Prize, H. Brundell.
Second Year.—"Andrew Oliver Prize," value £5 5s., E. A. D. Tanner.
Third Year.—Book Prize, R. Braine.
Fourth Year.—First Prize, Free pass to new School of Design for one year, J. B. M. Walsh.
Second Prize, value £3 3s., R. H. Mallock.

DAY SCHOOL.

First Year.—Studio Prize for best work done throughout the year: Value £2 10s., O. Campbell Jones.
History Examination: Book Prize, P. M. Hill.
Construction Examination: Book Prize, W. Steer.
Freehand Studies: Book Prize, A. G. Brau.
General Progress: Book Prize: A. S. Whitburn.
Second Year.—The Association Two-Year Course Certificate has been awarded to the following students:—C. J. Brandon, G. G. Clark, N. F. C. Day, F. F. Eschawzer, J. H. Hopewell, W. H. Lloyd, J. L. Murgatroyd, F. Reixa, H. Schein, G. E. Tubbs, F. R. M. Woodhouse, and R. C. Blampied.
End of Session Test: Value £4, G. Clark.
Freehand Studies: Book Prize, G. G. Clark.
Travelling Studentship: Value £20, E. P. M. Woodhouse, for best work done throughout the year.
Second Prize, Studentship Competition: Value £5, F. A. Eschawzer.
"Howard Colls." Travelling Studentship: Specially awarded in Second Year by the Council: Value £15 15s., W. L. von Berg.
Third Year.—Book Prizes for best work done in the Studio during the year: (1) W. T. Chung, (2) D. C. L. Derry, (3) H. F. Gossling.
The Jarvis Scholarship, value £40, A. R. Hamilton. Awarded for the best constructional sheet prepared in connection with a design subject.
The Day School Travelling Studentship, value £50,

A. Stanhope Forbes for best work done throughout the year.
Second Prize.—Studentship Competition: Value £10, divided between James Burford and J. H. Jacob.
A. A. Travelling Studentship, value 25 guineas. Specially awarded in third year, R. A. Duncan.

OTHER PRIZES.

A. A. Essay, prize value £10 10s., A. S. G. Butler.
Banister Fletcher Entrance Scholarship to Evening School: Tenable for two years, value 25 guineas, P. S. Hudson.
A. A. Entrance Scholarship to Day School, Tenable for one year, value 45 guineas, F. W. Matthew (Dover College).

THE HAPPY MEDIUM IN ARCHITECTURAL DESIGN.

Mr. Baker afterwards addressed the students, remarking that he was very pleased to observe that the basis of the education in the A.A. School, of which he was a humble student, under much less favourable surroundings, five-and-twenty years ago, was mainly Classical; but he thought there was a danger of going too far in the Classical direction. Success in architecture rather meant the happy medium between control and liberty. There must be some guiding star in the way of sentiment behind, and perhaps the most valuable one to Englishmen was that of the great inheritance they all had. No doubt what made English architecture supreme was that it was always gentlemanly, quiet, and reserved. What they all wanted was self-repression. They must all, of course, have their individual soul, but they must not plaster it on the outside of a building. Good architecture was evolved out of practical considerations, and it should have a sentiment to inspire; but it was not based on symbolism and sentiment. We had much, very much, to learn from other countries, and they should imbibe all they could from them, and they need not lose sight of the English characteristic of quiet restraint and simplicity. It was good that the light of the English gentleman should shine through all their architectural work.

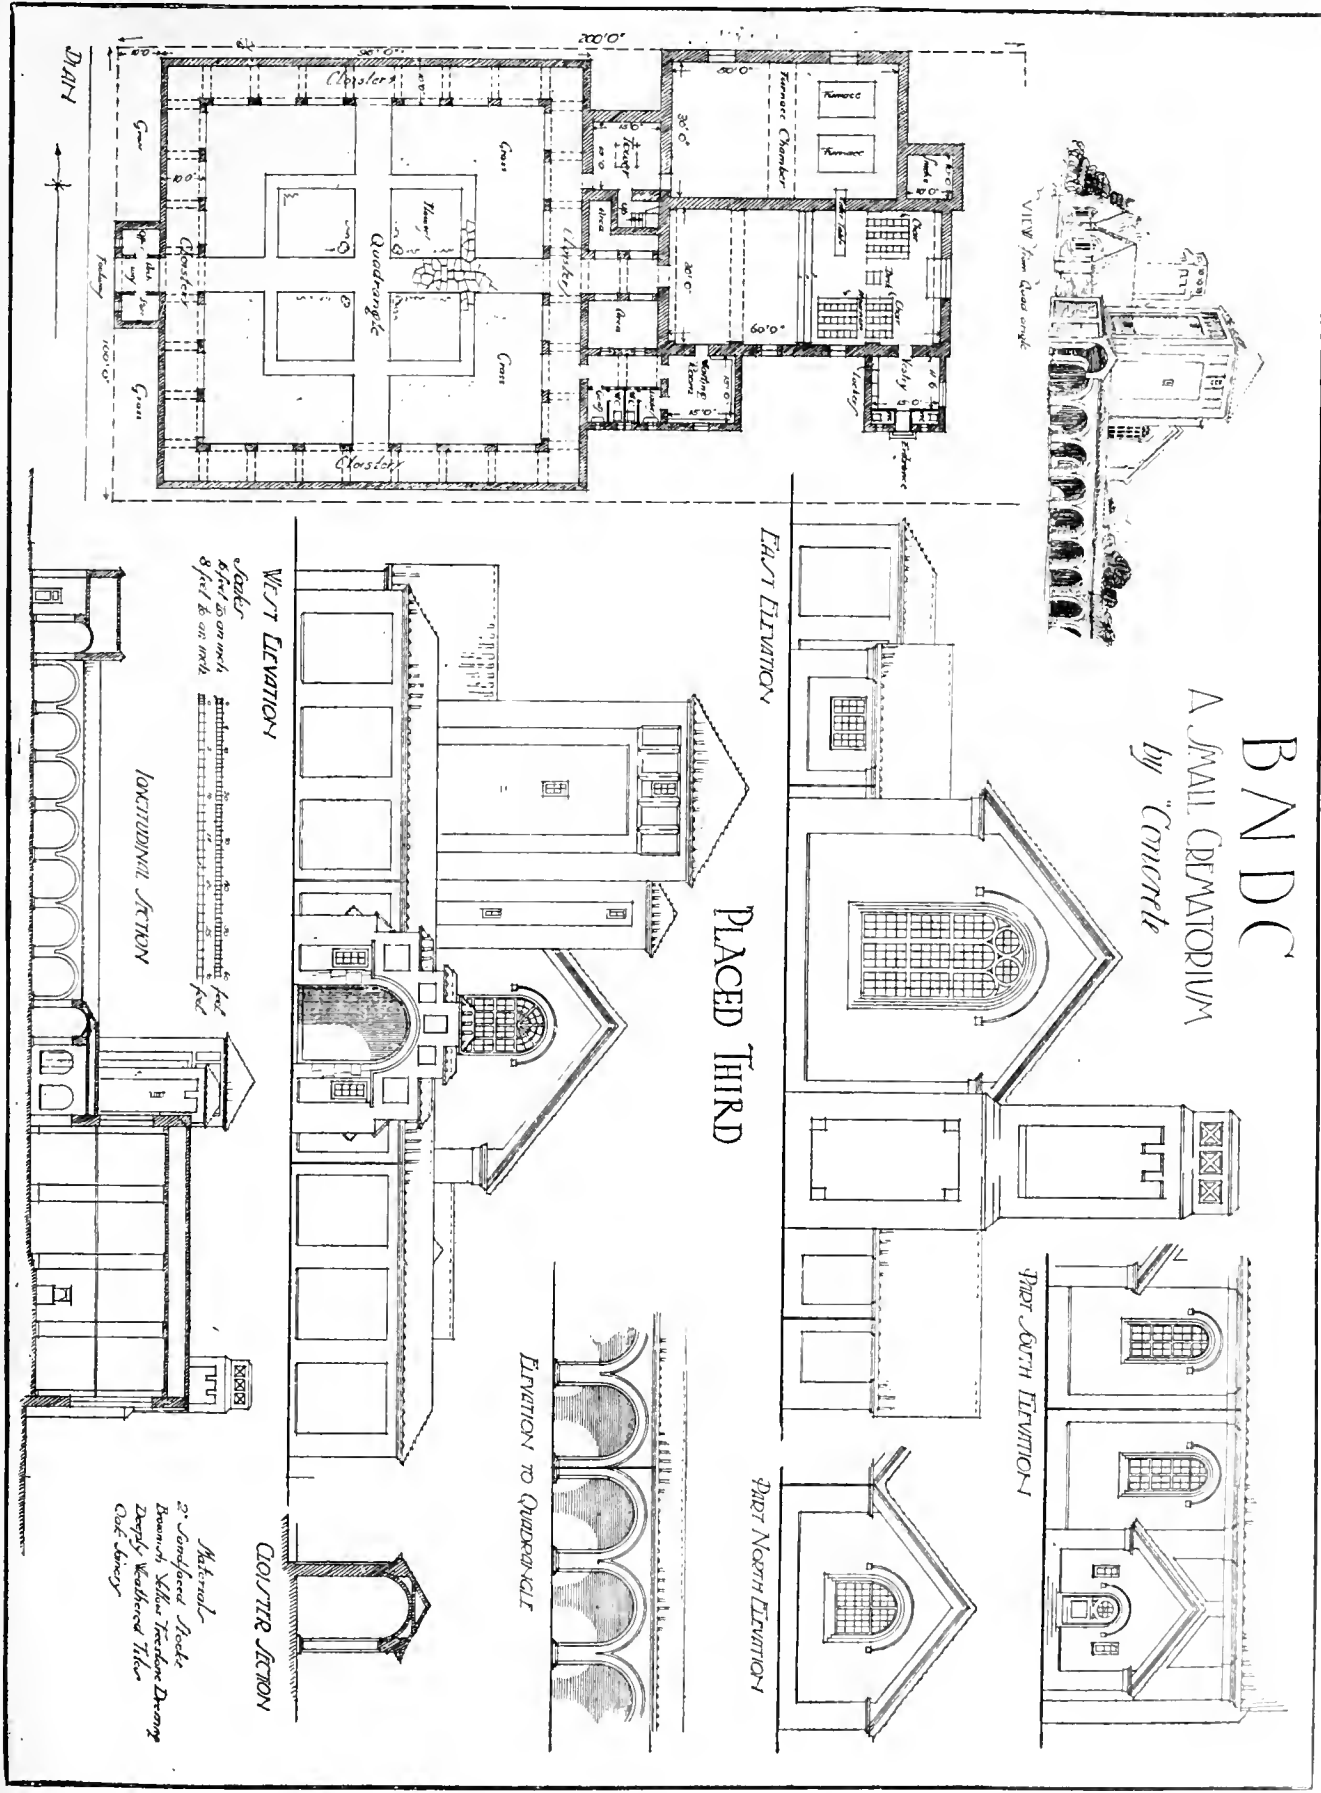

A vote of thanks to Mr. Baker was accorded on the motion of Mr. W. Curtis Green, immediate Past-President, seconded by Mr. H. Austen Hall, Vice-President.

"BUILDING NEWS" DESIGNING CLUB.

A SMALL CREMATORIUM.

By way of preface it may be well to give a reprint of the conditions published for the use of members of our Club. They were as follows:—

"A Small Crematorium on a Suburban Site for a County Town. The land is flat, and adjoins the public highway, and it is next to the parochial burial-ground. There is an available depth of 200ft., but this is not to be all covered by the buildings. There is a back access-way for service external to the site itself. The frontage is on the west, and measures 100ft. long, with no buildings on either side. The situation is of considerable elevation with reference to its urban surroundings, and there are some good trees round about. In the middle of the frontage, skirting the turnpike, going north and south, a central archway or gate-house, with a small inquiry office attached to it, is to lead to a cloistered quadrangle about 100ft. square, inclusive of cloister, forming the approach to the chapel, which is to have an open portecochère at the west end made to line with this entrance gateway. The cloisters for mural monuments to be 10ft. wide (out to out), and to extend all round the quad, leaving space for the gatehouse and chapel porch. The chapel is to be 30ft. wide inside and 60ft. long. On the south side provide a convenient waiting-room, with lavatory attached. Also a small vestry for priest and choir leading out of the chapel. On the north side of the chapel build a furnace chamber about 35ft. by 40ft., or of that area. A pair of furnaces which will occupy about 20ft. by 12ft., to stand clear of the walls, but about 5ft. away, only at one end of the furnace. Put a smoke-shaft 10ft. square, inside dimension at base, attached to one corner of this chamber. Above the portecochère, or, if preferred, at the west-end of the furnace chamber (and entered in either case from the cloister), carry up a tower about 15ft. square inside, and having iron galleries or stages

"BUILDING NEWS" DESIGNING CLUB.

BNDCC
A SMALL CREMATORIUM
by "Concrete"

recurring every 7ft., to be used as a columbarium, with niches in the walls for urns or caskets. The approach to these galleries is to be external to the tower by way of an attached stair turret. The total height of tower, including conical tiled roof, to be about 50ft. from the ground. The materials to be brick and stone and tiled roofs. The style is not to be Classic or Oriental; but otherwise the competitors are left free, provided the style is adapted to the materials specified

and appropriate to Christian sepulture. The plan and section may be drawn to the scale of 1/16ft. to the inch, elevations 8ft. to the inch. No technical details as to the furnace, etc., need be elaborated on the drawings; but the chapel and furnace chamber must be connected by means of a hatchway or small opening above the level of the roller-table arrangement used for passing the bodies through from the chapel to the furnace-chamber. A perspective view from the cloister

showing west-end of the chapel is desired. "Enfant" is placed first, "Paolo" second, and "Concrete" third. All three average on the whole very much in equality of merit, though we cannot fail to note their general shortcomings. Neither happens to be specially good, and in this way we have had some little difficulty in arriving at an exact conclusion. One fault common to all the plans sent in is the comparative disregard by their authors as to the suitable seating and

amenities of the chapel. Everybody knows what uncomfortable and barn-like places cemetery chapels usually are, so cold and uninteresting, with no inspiring charm and little æsthetic character about them, to say nothing in regard to any suitable provision for religious worship or its associations. The burning of the dead has nowadays to be provided for irrespective of creeds; but the majority of mourners in this country still keenly appreciate the consequence of religious observance—at any rate, at burials—and to a great number the environments of the service and its ecclesiastical associations count for much, while to some they still are accounted very highly. A few may possibly profess a contrary opinion; but none who happen to attend a funeral service at a crematorium would actually prefer an ugly and repellent-looking chapel even if they keep their views to themselves, out of deference to the religious predilections or practice of some dear relatives or friends, who also have to be present to participate in the last offices for their dead. Christian charity and natural reverence for the departed is incompatible with the provision of ungainly or barbaric places of sepulture. In any event, for the purposes of this competition, whether this be so or not, we provided as one of the leading conditions that the designs should be made relatively appropriate for this purpose. We scarcely can say that this rule, thus laid down, has received a precise compliance, though "Paolo" has suggested a sort of sanctuary, and "Tee-Square" gives a chancel. "Concrete" crowds his seats together, eastward, beyond the catafalques, and writes on his plan the word "choir." Perhaps the arrangement of a funeral is too casual and is treated much as a matter of local fashion, but ordinary usage and decorum suggest that the corpse should be near the officiating clerics, or, at any rate, in front of the assembled mourners. We did not expect too precise a decision as to the detail of a crematorium; but "Enfant" avoids any decision on superfluities by omitting all furniture in the chapel save the catafalque table. Its relation to the furnaces in the incinerarium is doubtfully near the first one, thus allowing for access to the other with too little space to turn in. This chapel anyhow is roomy, and if not too dark (which it certainly would seem to be), a working arrangement of suitable seats and desks might be made. The tower, rising above the porte-cochère, is over-pretentious in treatment, and would effectively block out the much-needed light from the west-end window of the chapel, whereas the furnace chimney prevents a central light at the east-end being constructed, over where the altar would be placed. The odd setting-out of the side windows is unhappy, and they have an uncomfortable appearance. Besides this, their sills are much too low down. We are not particularly pleased with the waiting-room either; and here the lavatory arrangement is far from nice, being too self-evident and very cramped. The vestry is not much better. The drive-in round the quad allows of a proper use of carriages and a hearse. This is most important. The columbarium wall-space is interfered with too much by the windows on the four faces of the tower, and they suggest too much the style of a belfry. The diagonal paths at the corners of the cloister cut up the look of the plan awkwardly, and leave inconsequential and odd-shaped grass plots or flower-beds scattered about. The smoke-tower is over-elaborated and suggests a columbarium. The gatehouse roof is not happily managed in relation to the cloister roofs, the projection being on the outside only; the difference of span likewise is too slight to warrant such a deviation as here arrests attention. This criticism applies also to the central front feature, which is over-assertive above the gateway arch. The office-doors, likewise, by being situated in the cloister, necessitate going a long way round or a short cut being made over the flower-border or grass plots. One "office" would be too isolated from the other, and perhaps the second one might have been utilised as a shed for the gardener. The stair-turret to the tower columbarium has an ungainly termination, done in masonry, which quarrels with the tiled spire, and the square windows below it lack grace and scale. The

roofing of the furnace-chamber, being in three spans, is complicated, and a flat would have sufficed, allowing room for side-windows to the chapel. Another window could easily have been arranged on the south side of the chapel by curtailing the width of the lobby to the waiting-room. The base of the tower is most inadequate on the west face, and the plan does not agree with the perspective, which shows a wider respond pier to the side openings, of a more substantial thickness than the plan provides for. We have thus picked the details of this scheme out for adverse comment, in the hope that the author may understand how to avoid such elementary faults in future. The other competitors, in the face of such criticism, very likely may doubt the wisdom of our choice in giving "Enfant" the premier place in this competition; but the fault, after all, is theirs, seeing that their particular proposals afford no alternative in the making of this selection, though, we admit, as already stated, we hesitated considerably before coming to a conclusion which, after all, is only relative, even if it ranks as final.

Our first impression favoured "Concrete." "Paolo" has set out his scheme on Lombardic lines in a way which might have been made more befitting to the objects in view had he evinced more care and not gone wrong on some essentials. The boundary wall of the quadrangle formed by the cloisters should have been brought forward to the west frontage line, and the gatehouse was intended to form part of this elevation, and not isolated in the manner shown by "Paolo's" lay-out. He has not overcome the difficulty of bringing in a funeral procession with coaches and a hearse to set down the coffin and mourners in the porte-cochère. The space which he has afforded is needlessly curtailed by the disposition of his grass-plots or flower-beds. He has not included the design of his gatehouse at all, and that ought to have been illustrated. The porch to the chapel is roomy, and, so far, good; but the arcade in front might well have been continued on the same proportions as the cloister arches, leaving the side openings larger, for carriages to pass under easily. This, however, is a detail and rather a matter of taste in design. Mere breadth of wall space over the arches to the west of this portal would, we think, have added dignity. The roofing of this porch is not correctly shown in the side elevation, as according to the view the eaves would extend along the side piers of the chapel walling, with a small hip. No narthex was needed in this chapel, and as drawn it would be dark and useless. The waiting-room looks rather small and the lavatory is over-large; but the w.c.'s are better isolated than in the first scheme. "Concrete" has the best arrangement of either in this particular. The catafalque is too near the western end of the chapel, but the relation of the table to the furnaces has been considered. Their shape, however, is too long and narrow. The sanctuary in this chapel is too crowded up, with its twin pulpits or ambones. The vestry ought to have had a lavatory provision, as ministers and the staff are on duty, who sometimes may have to attend for hours, and others may come from long distances, to say nothing of choir-men occasionally attending such services. "Paolo" provides stalls for a choir, and so ought to have realised their physical needs in other respects than vocal. The canted splay shown to the east wall are not an improvement, and a window would have brightened up the interior. The section represents the flat over the incinerating chamber as being level with the chapel eaves, so that no clerestory windows could be ranged along the north wall, as are shown on the south, and the columbarium tower also stands in the way west of the furnace-room. This tower is the best part of this design, though more light would be needed to illuminate the series of its gallery floors within. Two only of the openings on each face are pierced for light, and these have merely perforated stone slabs, judging from the front elevation. The chimney-shaft is too much like a factory, and though in the group, as figured by the perspective, it looks well enough, the undue prominence of fire-consumption suggested is needlessly objectionable, even if some may say this is only a question of sentiment. The west front of the chapel,

with the sculptured saint partly in the middle niche and standing on a corbel, is not a very attractive performance, and is poorly proportioned.

"Concrete" omits a porte-cochère and makes it impossible to bring the dead by coach further than the outside gateway. He clutters up the intervening space between the cloisters and the chapel with a pair of queer little areas where not even grass would grow, and rubbish fostered by damp would be liable to accumulate. The chapel is badly arranged with the chief part of its area left unoccupied, and some seats crowded together eastwards of where the body would stand, and, besides, with a bigger choir set out on one side of the sanctuary than on the other. The chapel is not well lighted. Only two side-windows are provided, while the big east window is entirely out of scale with that at the west end. Both are semicircular-headed, but they are otherwise absurdly different. The eastern one affects a tracery ideal and has only three lights, though it is nearly twice the size of the west window, which is divided into four lights and having only radiating divisional bars in the head and no tracery. The tower and the chimney group excellently in the sketch, and the cloisters look pretty and simple. In a general way the composition looks like a crematorium. It is when we get to details that we find how mistaken one may be. The incinerating chamber is not well contrived. It is so big, and the columbarium stairs are pitch dark and badly placed, with no light in the base of the tower either, save from the external doorways. Thus the story which we have had to tell gives little satisfaction, and had we viewed the matter in a superficial manner the order of our placing might have been reversed.

"Tee-Square" is very incomplete in his set of drawings, and we are unable to say that the design over which he has expended so much care is particularly commendable. This big, wide tower, with its double turrets and twin stairways, looks large enough for a town entry or gateway. The wooden dormers and diminutive apsidal chancel seem to belong rather to a village church or school chapel of the middle-class private and exclusive kind. The porte-cochère consists of only a small set-off from the cloister; but there is a good carriage approach in the quad. The gateway is not delineated. The plan is uniform and symmetrical. The incinerarium is the best of the series, and the catafalque is properly located. The waiting-room is capacious and the vestry is big enough for State occasions. In execution the cloisters would look dignified and monumental, though they do not belong to the chapel, either in scale or style. No section is given of the chapel, the dormers of which start above the flats of the adjacent buildings. There is no perspective view.

THE ROYAL INSTITUTE OF PUBLIC HEALTH.

The twenty-second annual congress of the Royal Institute of Public Health was held at Edinburgh on Thursday and Friday in last week, and was very numerous and influentially attended. The Lord Provost of the city presided. The inaugural address was delivered in the Usher Hall on Thursday night by the president of the congress, the Mayor of Linlithgow, who observed that while no practical person could fail to look to good laws and to improved economic conditions to do much to better the lives of the masses, the great hope of the future lay in the spread of sound and healthy knowledge in the appreciation by all men of those natural laws which claimed an unswerving obedience from all things living, and the disregard of which brought, sooner or later, the certain penalties of sickness and misery. He feared that we were not doing all that was possible to bring the public consciousness to a healthy view of these great problems. There were signs that public interest in the country was awakening to the importance of research work; but he doubted if the general public realised that ours was the only country in which the leading surgeon-physicians, and specialists do not as general rule control laboratories, and research work. The gold medal of the

institute for conspicuous service in the cause of preventive medicine was awarded to Dr. James Niven, Medical Officer of Health for Manchester, for his work in the direction of prevention of tuberculosis.

STATE ASSISTANCE IN HOUSING.

At Friday's sitting of the congress, held in the Old University, Sir Thomas Hunter, town clerk, Edinburgh, read a paper before the section dealing with urban, rural, and port sanitary administration on "Powers and Duties of Local Authorities with Regard to Housing." It was not enough, he said, that spasmodic efforts be made to find a remedy for overcrowding. Only by persevering, continuous, well-directed work would the stroughold be forced to give way. Its causes were not merely physical, but also moral and social, which could be reached only by moral, social, educational, and religious agencies. It was necessary, however, for effective action to utilise the forces of the community in the organised and permanent form as represented by the local authority acting under compulsory powers. The question not only affected the poor. It directly affected a very large number of the population, and indirectly and in a very real way vitally affected them all. By far the largest part of it concerned the working population, who were able and willing to pay their way, to be provided at a rent they could afford with the kind of accommodation which they and their families ought to have. Hitherto, for the most part, local authorities had been content to allow private enterprise or the laws of supply and demand to meet the housing requirements. The standard of housing had to be raised. The local authority must insist upon houses being fit for human habitation to get at the source. As a necessary complement of the work undertaken by local authorities in the crusade against consumption, they must direct their earnest attention to their responsibilities and powers in connection with the housing question. Sir Thomas Hunter proceeded to describe the numerous Acts of Parliament and their powers, and said whatever criticism might be made on these Acts the Legislature had put considerable power into the hands of local authorities, and thus placed upon them the responsibility for its use. The necessity of continual vigilance against overcrowding of persons per room required more attention than had hitherto been given to it. The Housing Acts did not provide prompt and effective measures for dealing with it, and the provisions of the public health and local Acts applicable to it were far from being sufficient or satisfactory. The larger part of the problem was to provide houses with suitable accommodation, at a rent within the means of the ordinary working man in regular employment—that was at a rent he could afford, which would be sufficient to yield a fair return upon the outlay, and not entail a burden upon the rates. The local authorities should direct their special attention to this. It might be found that there were a number of cases on the borderland where the local authority would have to incur cost in connection with the removal of existing slums, or reconstruction of existing buildings, for which there was no return, or only a partial return, and it might be expected that there would be a residuum or certain number of cases more or less, where it would be found impossible to get any adequate return from the occupants. That expenditure was truly for public health purposes, and as such the local authority should have a good claim against the Government for a grant towards it. In many cases the local authority might find it possible to arrange with voluntary associations, such as public utility associations, or the social union, to carry out building schemes.

Professor E. W. Hoop, Liverpool, submitted a paper dealing with housing operations and their results in that city.

Sir William S. Brown, in a paper which dealt with "Housing in Edinburgh," described what had been done in the city, particularly under the 1893, 1898, and 1900 improvement schemes. In round figures the schemes cost £177,000, and the total tax on

the community had not exceeded on the average more than one halfpenny in the £1. Within the past forty years the death-rate of the city had fallen from 27.8 to 14.3 per thousand.

Dr. Wilson, Medical Officer of Health, County of Lanark, dealt with the housing conditions in Lanarkshire.

DUST AND TUBERCULOSIS.

In the section of Industrial Hygiene, Professor J. M. Beattie, Liverpool, submitted a paper on "Dust Disease." He urged the great importance of strict regulations against uncontrolled spitting in workshops and elsewhere, and of insisting on regular medical examination of the workers. Unless this was done, he believed all elaborate precautions to minimise the amount of dust were only touching the fringe of the whole question. The paper was illustrated by lantern slides, showing the effect of dust on the lungs.

LEAD POISONING AND ITS TREATMENT.

A discussion on "Electrolytic Treatment of Lead Poisoning" was initiated with a series of experiments carried through by Mr. T. M. Clague, Newcastle. Dr. William H. P. Oxley, in the course of the discussion, gave the results of some experiments he had conducted, and said he had not been able to confirm the results of Sir Thomas Oliver, that any lead was extracted from the body as the result of the treatment. Sir Thomas Oliver said that Dr. Oxley's experience of the treatment differed from the results they had obtained at Newcastle. Their experience was one that was extremely favourable to the treatment, and he was glad that Dr. Oxley was still continuing the treatment, because he thought this was a subject upon which they should have a perfectly open mind.

NEW SCHOOL-BUILDING REGULATIONS.

After an interval of seven years, revised regulations relating to the planning and fitting-up of new elementary school buildings have just been issued by the Board of Education as a White Paper. In a prefatory note, Sir A. L. Selby-Bigge, Permanent Secretary to the Board, remarks that the regulations now laid down are partly a statement of principles of school planning upon which the Board proceed in criticising the plans submitted to them, and partly a statement of what the Board believe to be the best current practice. The main object is to facilitate co-operation between the Board of Education and the Local Government Board on the one hand and local education authorities and school architects on the other in securing the greatest amount of comfort, convenience, and suitability which a reasonable expenditure can be made to yield. The combination of efficiency and economy is the perpetual problem of the school architect. The problem for the Board of Education, it is pointed out, is in some respects even more difficult than for the architect, or the member of the local authority who is responsible to the ratepayer. In considering educational advantages they do not ignore the effect of beauty of design, or material or decoration on the minds of the children or of their parents. On the other hand, the Board have to take account of the present state of public opinion, and while endeavouring to influence public opinion in the direction which they believe to be beneficial to the nation, they cannot ignore the risk of provoking reaction. In this, as in other departments of administration, some degree of compromise is inevitable.

RECENT MODIFICATIONS.

The present regulations—which are to come into force on September 1 next—are the outcome of discussions which have taken place during the last six years in numerous cases between the Board's officers and the officers and architects of local education authorities and governing bodies. Theory and practice are constantly developing with a tendency towards restriction and uniformity in some directions, and towards variety and relaxation in others. The principal modifications in the present issue relate to design as affected by ventilation, to disposition of buildings on

the site, to size and organisation of departments, and to the extent and character of facilities for physical exercises, play, and organised games, whether for older or younger children.

In school planning, it is pointed out, certain principles are tolerably well settled; but the modes in which even the most firmly-established may be applied, and the standards by which they are tested in concrete cases, are subject to change.

SELECTING THE SITE.

The point first insisted on is that the site for a new school should be carefully chosen. If possible, it should be in an open situation, and have no undesirable surroundings. It should not be exposed to noise or dust from roads, streets, tramlines, railways, or works. It should be such that the building can either be set well back or have its classrooms on a side away from the street or road, so that there may be no difficulty in keeping their windows open, and it should allow of classes being taken in the playground. In towns the site should, where possible, be within reach of any public park or central playground in which there are opportunities for open-air education and organised games.

The site should, if possible, be sufficiently large, open, and level to allow all the rooms to be on the ground floor. It is in any case desirable that the building should be on not more than two floors. A school on three floors is open to many objections, and should be necessary only in special circumstances, as, for example, where land is very costly, or where it is otherwise impossible to get adequate area for playgrounds.

The site must include space for a playground. Where the site is expensive, the provision of a playground on the roof of the school buildings has been found, in some cases, to be a satisfactory device. In order to provide space for a playground, the minimum area required for the site should be reckoned, in the absence of exceptional circumstances, at a rate of a quarter of an acre for every 200 children, irrespective of any space required for a teacher's or caretaker's house, for special subjects centres, or for instruction in gardening. If the school is of more than one story, or if a roof playground is provided, the area can be proportionately reduced.

IMPORTANCE OF ECONOMY.

In the style and general treatment of the building, every care should be taken to secure economy. The Board regard this as a matter of great importance. All proposals for new schools will be carefully examined, and the Board will ask for the omission of any features that appear extravagant, and may require a modification of the whole scheme should the proposed expenditure appear unreasonably high. The possibility that the school may require enlargement in the future should be borne in mind, and in cases where an early extension is likely to be required, the future additions should form part of the original scheme, and be included in the plans submitted to the Board.

The Board will consider a proposal for the installation of shower baths or spray baths of a simple and effective kind in connection with a school where difficulty arises in providing facilities for cleansing children otherwise. Such baths should provide for the bathing of twelve to twenty children at one time, and should have simple dressing boxes or partitioned spaces, and a drying chamber and storage for towels.

It will be apparent that although stress is laid on the necessity for economy, the hostility of ratepayers to the Board's requisitions is likely to be intensified rather than abated by the new regulations, as they suggest various augmentations in costumes of sites, buildings, and their equipment.

The foundation-stone of the new Catholic church of St. Joseph, Longsight, Manchester, was laid on Saturday by Alder S. S. S. The church will cost £28,000.

The death is announced of Mr. John Unthank Braithwaite, who was for upwards of forty years an architect in the employ of the North Eastern Railway Co.

THE LONDON COUNTY COUNCIL.

At Tuesday's meeting of the London County Council the Highways Committee reported that, in accordance with the Council's resolution that the traffic congestion caused by dead-ends, other roadway obstructions, and street markets should be removed as soon as possible, they had considered the whole subject and had consulted M. A. Mariage, Directeur-Général des Omnibus de Paris. The Committee hope to submit a prepared scheme in time for Parliamentary action next year, but cannot submit their report until after the summer recess. For the supply of 10,000 steel tires for trams, the Committee reported that the lowest tender for British-made tires, £10,600, was nearly £1,800 higher than a Belgian tender, and considerably higher than three other foreign tenders. The Committee recommended the acceptance of a London tender, that of Messrs. John Batt and Co., who will supply tires made in Germany.

The Improvements Committee recommended approval of elevations, to be executed in Portland stone, of buildings to be erected on sites in Kingsway by Messrs. King and Arnell, Ltd., and also of elevations for buildings proposed to be erected by the Crown Agents for the Colonies on a site at the corner of Millbank and Wood-street. The elevation continues the treatment proposed in the elevations of buildings to be erected for the Crown Agents on an adjoining site. The Improvements Committee further reported that in connection with the widening of High-street, Wandsworth, and East Hill, proceedings were taken by the trustees of the East Hill Baptist Chapel for an injunction to restrain the Council from proceeding upon a notice to treat served upon the trustees for the acquisition by the Council of a portion of the forecourt, wall, gates, and railings of the chapel. Upon a motion in the action coming before Mr. Justice Joyce, he held that, as substantial alterations would have to be made to the main building to render it suitable for use after the forecourt had been added to the roadway, the taking of the land in front of the premises would be an interference with the main structure of the building, within the meaning of the proviso to section 18 of the London County Council (Tramways and Improvements) Act, 1913, and he therefore granted an injunction restraining the Council from proceeding under the notice to treat. The power to acquire parts only of property required for improvements is, the Committee reported, a most valuable one to the Council, particularly as the greater portion of the improvements now undertaken by the Council are effected by means of the acquisition of parts only of the premises affected, thus saving considerable expense. It would therefore be appreciated that the decision of Mr. Justice Joyce has a most important bearing on the Council's work, and the Committee obtained the opinion of the two counsel engaged in the case as to the prospect of a successful result of an appeal. They expressed the opinion that the question is a very narrow one, and wholly one of construction, and pointed out that on such a question it is obvious, as the learned judge himself said, that there may well be a difference of opinion, but they think that an appeal would have a fair chance of success, and having regard to the far-reaching effect of the decision, and the importance of the matter to the Council in many other cases, they say that an appeal is, in their opinion, desirable. The Committee therefore recommended the Council to appeal against the decision of Mr. Justice Joyce in these proceedings.

It was recommended by the Education Committee that Professor Selwyn Image be appointed to give a course of fifteen lectures on the "History of Art" during the session 1914-15, at the L.C.C. Central School of Arts and Crafts at a fee of £75.

Mr. W. J. West resumed the debate upon the recommendation of the Local Government Committee that the tender of Messrs. W. E. Blake and Co., Ltd., of Fulham, amounting to £98,980, for the erection, within a period of twenty-one months, of the new Sessions House, Newington-causeway, be accepted. Mr. George Dew had moved at

the previous meeting that the recommendation be referred back to the committee, with instructions to arrange for the invitation of fresh tenders for the erection of the building from firms who had not locked out their workmen, but Mr. Ernest Gray moved an amendment to this to the effect that the tender of Messrs. Blake and Co. be accepted, provided that the committee were satisfied that that firm were fully prepared to comply with the requirements of the council in respect of rates of pay and conditions of labour. This was carried, and Mr. W. C. Johnson then moved, as a further amendment, that arrangements be made for the execution of the work by the direct employment of labour. This was seconded by Mr. J. D. Gilbert. In the course of discussion Mr. I. Salmon deprecated any action which could be construed into the taking of sides in the dispute in the building trade, and Mr. R. G. Easton protested against the proposal as an attempt to revive the Works Department, which he described as "a sink of iniquity." The amendment was defeated, on a division, by 67 votes to 43. Mr. R. C. Phillimore moved the addition of words providing that the firm should give the committee an assurance that they were not engaged in such a dispute with their employees as would in any way delay the normal starting of the work. This was seconded by Mr. D. Blackley, but lost, and Mr. Gray's amendment was then adopted as the substantive motion.

The chairman of the Highways Committee stated, in reply to a question, that in 1913 the motor-omnibuses of the London General Omnibus Company covered 120,000,000 miles in or around London. A tax of three-eighths of a penny per omnibus mile on that mileage would produce £187,500.

Mr. G. H. Hume, chairman of the Highways Committee of the London County Council, states that it is the intention of the council, after the autumn recess, to promote, at the cost of £1,000,000, a scheme for linking up, extending, and consolidating the system of London tramways. The proposals include extensions of the tramways in Gray's Inn-road and Holborn; Hammersmith to Shepherd's Bush; Euston-road to Hampstead-road; a new track in Marylebone-road; a link in Anhurst Park-road; a new line from Tottenham-court-road, and an extension from Whitechapel to Aldgate.

THE NATIONAL FEDERATION OF BUILDING TRADES EMPLOYERS OF GREAT BRITAIN AND IRELAND.

The half-yearly general meeting of this Federation will be held at the South Wales Institute of Engineers, Park-place, Cardiff, on Wednesday, July 29, 1914, at 10.30 in the forenoon, to consider the following business:

1. Notice calling the Meeting.
2. Minutes of the last Annual Meeting, held Jan. 24, 1914, and business arising, if any.
3. Welcome to representatives from South African Federation, from the International Federation of Building and Public Works Contractors, and from kindred Associations.
4. Report, in accordance with decision of a former Meeting, a short interim Report will be submitted to the Meeting, and published in the N.F. Record.
5. Consider recommendations from yesterday's Council on the following matters:—
 - (a) The question of a Lock-out in support of London.
 - (b) The Revenue Bill.
 - (c) Housing Schemes. Motion by the Yorkshire Federation.

"That this Federation is strongly of opinion that in all cases in which sanctions are given by Government Departments to Local Authorities for the raising of loans for construction of houses and other public works, it should be made a condition of the sanction that the works should be carried out by private contractors after open competition."

- (d) The National Insurance Act, Parts I and II:—
 1. Motion by the Yorkshire Federation:—

"That in the opinion of this Federation, the cost of accident, health, and unemployment benefits should be borne equitably among taxpayers in general, and industries be relieved from the heavy and growing charges in respect of benefits to workmen."
 2. Motion by the Midland Centre:—

"This Federation reiterates the protests which it made on the introduction of the National Insurance Act, 1911, against the principle of payment by industries, instead of placing the burden upon incomes. Two years' experience of the working of the Act have proved that it is a serious handicap to competitive trade, and this Federation appeals to the Government to amend the Act that all expenses of National

Health, Unemployment, and Workmen's Compensation Insurance shall be paid for out of income-tax money instead of as at present by certain selected trades."

(e) Building By-laws. Suggestion from Yorkshire Federation.

(f) Forfeiture of Goods by Freeholder. Motion by the South Wales Federation:—

"That it is desirable that steps be taken to amend the Law that if a freeholder or assignee, by way of forfeiture, takes over and uses goods or works delivered or executed upon the freehold by direction of the leaseholder, or his agent, in accordance with the requirements of the lease, he shall be required to pay for them on the principle that he who takes the benefit should bear the cost."

6. Next meeting.

7. Such other business as may be presented by the President.

SUMMER MEETINGS OF THE FEDERATION IN CARDIFF.

Tuesday, July 28, 2.30 p.m.—Executive Council Meeting at the South Wales Institute of Engineers, Park-place, Cardiff.

7 p.m.—Dinner to the Members of the Executive Council by the Members of the Cardiff M.B.A. Invitations will be issued from the Office of the Cardiff Association to those who signify their intention of attending the Council Meeting. Kindly forward names as early as possible.

Wednesday, July 29, 10.30 a.m.—General Meeting at the South Wales Institute of Engineers, Park-place, Cardiff.

Afternoon.—Visit to Cardiff Castle.

7.30 p.m.—Civic Reception by the Lord Mayor at the City Hall.

Thursday, July 30, 9.35 a.m.—Trip by steamer to Ilfracombe, returning from Ilfracombe at 6 p.m.

THE BRITISH PORTLAND CEMENT MANUFACTURERS, LTD.

The report of the directors of the British Portland Cement Manufacturers, Ltd., to be submitted to the third ordinary general meeting of the company, to be held at Winchester House, Old Broad-street, London, E.C., on Monday, July 27, 1914, at 12 o'clock noon, together with the audited accounts for the year ended April 30, 1914, states that the balance brought forward from last year was £32,568 9s. 2d. The revenue for the year amounted to £330,428 8s. 11d., against which has been charged: Directors' and trustees' fees, £9,828 4s. 6d.; debenture stock interest, £49,646 12s. 4d.; debenture stock redemption account, £10,498 15s. 1d.; bargo and rolling stock depreciation account, £2,000; depreciation of office furniture, £389 5s. 6d.; debenture stock issue expenses, £465 5s.; Income-tax, £4,600; sack reserve, £2,500; making £79,928 2s. 5d.; leaving a profit of £250,500 6s. 6d. An interim dividend on the preference shares to October 31, 1913, paid January 31, 1914, absorbed £34,969 16s. The directors propose to make the following allocations: Preliminary expenses account, £11,755 11s. 9d.; general depreciation reserve account, £40,000; leaving the sum of £196,343 7s. 11d. The directors recommend the payment of a final dividend on the preference shares to April 30, 1914, amounting to £35,354 5s. 8d., making, with the interim dividend of £34,969 16s. already paid, a total preference dividend for the year of £70,324 1s. 8d.; the payment of a dividend on the ordinary shares at the rate of 7 per cent. per annum for the year ended April 30, 1914, amounting to £96,666 11s. 1d., leaving to be carried forward £64,322 11s. 2d. The directors report an improvement in the trading results for the period covered by the accounts; they recommend that the balance of the preliminary expenses, amounting to £11,755 11s. 9d., be written off as against £6,000 written off this item last year; that £40,000 be added to the general depreciation reserve account, making it £80,000, and that the dividend on the ordinary shares should be at the same rate as for the previous year—namely 7 per cent. per annum—leaving £64,322 11s. 2d. to be carried forward, an addition of £31,754 2s. Trading conditions, upon the whole, have been satisfactory, but sales have been adversely affected in certain markets by labour disputes in various parts of the United Kingdom, while towards the end of the year the demand for cement somewhat lessened owing to the general decline of trade at home and abroad. The company's new works in the North of Ireland are making substantial progress, and it is hoped that they will be completed before the end of the current year. The construction of the works in South Africa, in which the company is largely interested, is well advanced, and

manufacturing operations are expected to commence within the next few weeks. When Lord St. Davids, on the formation of the company, accepted the position of chairman, it was recognised that he could only do so for a limited period, owing to the many other demands upon his time. This period has been exceeded, and the directors, with much regret, have now to report that he resigned the chairmanship of the company, and his seat on the board, at the end of the financial year. Captain the Hon. F. C. Stanley, D.S.O., has been unanimously elected the chairman of the company.

SHOPS AND SHOP-FITTINGS.

The present-day shopkeeper needs, above all things, if he is to meet competition, to improve his shop-front and interior, as it arrests notice right on his doorstep, just where he wants to attract his customer. He, and all architects and builders who second his endeavours, will do well, therefore, to get and study the 80-page royal 4to catalogue just issued by Messrs. Harris and Sheldon, Ltd., of Stafford-street, Birmingham, devoted solely and entirely to joinery works in connection with shop-fronts and interior fittings. It must have taken the compilers some years to collate the matter, gathered from all parts of the world, to illustrate the work efficiently, for it is a veritable textbook of shop-fittings.

It illustrates over 150 shops and interiors actually executed by Messrs. Harris and Sheldon, the work comprising jobs in places so far apart as London and Calcutta, or Johannesburg and Buenos Aires, whilst there are examples of work carried out for some of the most enterprising firms in this country. There is, indeed, scarcely a town of any size which has not benefited by the firm's exertions, the sphere of which is ever widening, as a visit to their works will demonstrate. There may be seen artistic inlaid counters and showcases being prepared for a Parisian firm, whilst, on the other hand, shop-fronts of specially hardened timber are being manufactured, to stand the heat of the West Indies.

Following up these examples of work actually executed by the firm in all parts of the world, we find examples of component parts of the modern shop, from fascias to stall-plates, giving over 300 examples of up-to-date fixtures and fittings (many unique in their way), the latest time and temper-saving devices, for which there is at the moment such a demand, being their patent "Selphast" sectional fixtures, made to store and yet display the most delicate garment, saving, as they do, fixture boxes and wrappers, and the useless labour wasted in straightening up after the customer has made his selection.

No branch of trade has been overlooked, from men's wear shops to jewellers', confectioners' to chemists'; suitable wall cases, fixtures, counters, all are illustrated so as to at once convey to the shopkeeper the realisation of that which is most suitable for his requirements, whilst, owing to the vogue at present in metal shop-fronts, these are specified, showing their component parts, and examples of the most artistic forms of enrichment.

It is manifest that there is an organisation behind this catalogue which is complete in all its details, generations of artisans having seconded the firm's efforts in the production of all that is best and up-to-date in shop-front construction, over thirty years' experience in the production of up-to-date methods of display, and the installation of the latest labour-saving machinery, having kept down the cost of production, even to the using up of by-products from sawdust upwards. There are hundreds of men solely employed in the production of shop-fronts and interiors; draughtsmen waiting to show intending customers how to make the best use of the space at their disposal, while of the quality of work consistent with price, the best idea will be gained by a visit to the works at Stafford-street, Birmingham, or the branches at 70, Wood-street, London; Springfield-court, Glasgow; 38, Thomas-street, Manchester; and 15, Wicklow-street, Dublin.

OBITUARY.

We deeply regret to record the death by a motor-car accident of Mr. F. Dare Clapham, F.R.I.B.A., of the firm of Clapham and Symons-Jeune, Norwich House, Southampton-street, Bloomsbury, and of the Avenue, Beckenham, at the early age of forty-one years. At the inquest held by the coroner for West Kent at Beckenham on Monday, Mr. Hedley Spencer Blake, a friend and neighbour of Mr. Clapham's, stated that on Thursday midnight he returned with the deceased from Charing Cross to Beckenham. On leaving the station they were crossing Southend-road when witness, glancing to the right, saw a car approach at a rapid pace on the driver's wrong side. The car appeared to be 20 or 30 yards away, and Mr. Clapham was a little in front of witness and apparently did not notice it. Witness said, "Look out," and jumped backwards. Mr. Clapham, who had less time to decide, seemed to make for the pavement facing him. When jumping backwards he was struck by the car. In cross-examination, witness suggested that deceased was carried or dragged for about 30 yards. Mr. Geoffrey Norman Foster, the Worcestershire amateur cricketer, and a financial advertising agent, stated that he was in the car with Miss Prest. He saw two gentlemen practically in the middle of the road, one of whom, in an attempt to get to the pavement, was caught by the near headlight. Witness did not think that the car was travelling fast. There was ample room for it to pass on either side of Mr. Blake and Mr. Clapham before they moved. Dr. Randall said deceased had a bad compound fracture of the right leg and a large scalp wound. Fred Torrence, the chauffeur, stated that had Mr. Clapham stood still the car would have passed him all right. The jury, in returning a verdict of "Accidental death," attached no blame to the chauffeur. Mr. Frederick Dare Clapham, who was unmarried, was the elder surviving son of the late Douglas Clapham, of Leabrook, Broxbourne, and after passing through Brentwood School, was trained for his profession at the Architectural Association and Royal Academy Schools, gaining the A.A. silver medal, and in 1901 a special prize in the R.I.B.A. Final. He was articled to Mr. E. J. May, F.R.I.B.A., and after a short period of independent practice, joined the late Mr. E. W. Mountford, F.R.I.B.A., in partnership, their work in collaboration including the Central Criminal Court at Newgate, which was completed under Mr. Clapham's supervision, and the extension of the municipal buildings at Sheffield. Among the works carried out by Mr. Clapham were the town hall and fire station at Lancaster, additions to the Battersea Polytechnic, including the Tate Library and the Tate Mausoleum at Kingston Vale Cemetery, Putney. Last year he assumed in partnership Mr. E. H. B. Symons-Jeune. Mr. Clapham joined the Architectural Association in 1891, and threw himself into its work with characteristic energy and application. Since 1906 he had been re-elected upon the Council, and in 1909-10 served as vice-president. He was a constant attendant at the meetings, read several papers, and often took part in the discussions. An accomplished amateur actor, he figured in all recent A.A. plays, and was the author of three of these amusing productions. He was also for a time the editor of the fitful publication, the "Purple Patch." He joined the Royal Institute of British Architects as an Associate in 1901, becoming a Fellow in December, 1909. The funeral service was held at St. George's parish church, Beckenham, on Tuesday, and was attended by Mr. Maurice E. Webb, president, Mr. Henry Tanner, past-president, Mr. P. W. Lovell, Mr. Symons-Jeune, and many other members of the Architectural Association, and by representatives of the Romany and Sidcup dramatic clubs, the Beckenham Arts and Crafts Society, and other bodies to which Mr. Clapham belonged. A large number of wreaths and floral tributes testified to the esteem and regard in which he was held, and to the regret felt at his untimely death. The interment took place later in the day in the family grave at Wormley, near Broxbourne.

The death has occurred, at the age of 65 years, of Mr. James Gillespie, senior partner in the firm of Gillespie and Scott, architects, of St. Andrew's, N.B. Among the buildings carried out by his firm are the Medical School and St. Leonard's School, St. Andrew's; the Cottage Hospital, Kirkcaldy; Montrrose House and Rankellor House, both at St. Andrew's. For many years he had been chairman of the St. Andrew's Conservative Club. He leaves a widow, four sons, and two daughters.

COMPETITIONS.

ALLESTREE FORD BRIDGE.—At the last meeting of the Belper Rural District Council, the surveyor reported that he had advertised for designs for the construction of a bridge over the Derwent at Allestree Ford, and had received 50 applications for the form of conditions, 15 designs, and 46 estimates. He suggested that these should be dealt with in the first place by the bridge committee. The estimates ranged from £450 for a 9ft. bridge to £1,292, and for an 18ft. bridge from £749 to £3,347. The question was referred to the bridge committee.

BRIGHTON.—The town council have eventually decided, by 25 votes to 13, to spend £25,000 on the erection of a concert hall for the municipal orchestra on the Aquarium site and to remodel the existing terrace, so as to provide accommodation for outdoor performances. The concert hall will accommodate 1,200 people, and the scientific portion of the Aquarium will be kept quite distinct from it. The questions of how to deal with the Aquarium site and the future of municipal orchestra have been deferred from time to time. Competitive designs are to be invited for the new scheme.

MIDDLETON.—The competition for the new town-hall at Middleton will probably be settled some time in August. Mr. G. Hastwell Grayson, M.A., F.R.I.B.A., president of the Liverpool Architectural Society, is the professional referee. One hundred and seven sets of plans have been received. So far, no steps have been taken as to the exhibit of the drawings.

The salary of Mr. G. W. Lacey, borough surveyor of Oswestry, has been increased by £50 per annum.

The Camborne Urban District Council have raised the salary of their surveyor from £120 to £150 a year.

Mr. R. S. Wilshire, of H.M. Office of Works, has been appointed assistant architect to the Essex County Council.

Mr. F. O. Starford, an inspector of the Local Government Board, recently held an inquiry at Lye, Worcestershire, into an application of the Lye and Wollescote Urban District Council for sanction to borrow £2,650 for the purpose of acquiring the Sudbridge Brook estate, and for carrying out various street improvements.

The foundation-stone of a new Roman Catholic Church has been laid at Gerrard's Cross, Bucks, by the Bishop of Northampton. The building will be Gothic in style, and carried out in red brick, with Bath stone facings. It will consist of nave and two aisles. The length will be 140ft., and the breadth 72ft. The architect is Mr. Percy A. Lamb, and Messrs. Y. J. Lovell and Sons are the builders.

The historic tower of Oswestry Parish Church is now in the hands of the builders. The roots of the ivy which enveloped it have caused it to crack ominously, and liberal repairs are necessary. The tower is one which was fired at and damaged by Cromwell, and in later years it has been associated with the escapades of Colonel Burnaby, of "Ride to Khiva" fame, who, as a boy at Oswestry Grammar School, climbed to the top of the tower by clinging to the ivy.

Lt.-Col. Henry Norland Rattan, who has resigned the city engineership of Winnipeg after a continuous service of nearly thirty years, is 66 years of age, and was a member of the first council of the Canadian Society of Civil Engineers in 1887, serving as president of the society in 1910. He will be retained by the city of Winnipeg in the capacity of consulting engineer, and will receive a pension, which, combined with his salary, will give him a yearly income of five thousand dollars. Mr. Rattan is a member of the council of the Institution of Civil Engineers of Great Britain.

PROFESSIONAL AND TRADE SOCIETIES.

THE BRITISH ARCHÆOLOGICAL ASSOCIATION AT CANTERBURY.—The seventy-first annual conference of the British Archaeological Association, held at Canterbury in conjunction with that of the Kent Archaeological Society, was continued on Friday and Saturday. On Friday the Eastbridge Hospital, founded in the time of Henry I., was visited, under the guidance of the Rev. P. A. W. Clarke; the adjoining school, added by Archbishop Whitgift, is now an almshouse. The fine West Gate, built by Archbishop Simon of Sudbury, in the 14th century, was examined under the leadership of Mr. H. T. Mead, the city curator. The building, which was used from 1549 to 1829 as the city gaol, served for many years afterwards as a mortuary. In 1906 Mr. Bennett Goldney, M.P., the then mayor, restored the condemned cell and galleys, and established within the Gate a museum of arms and armoury and other objects. A visit to Canterbury Cathedral, under the guidance of the Rev. C. E. Woodruff and Colonel Hegan, Seneschal, was afterwards made. At the Cathedral library, Mr. Woodruff explained that, according to the catalogue, compiled by Prior Henry, of Eastry, now in the British Museum, there were in the library either late in the 13th or early in the 14th century, 1,831 volumes and 4,157 treatises. Of that number Dr. James had identified 182 as being still in existence, principally at Corpus Christi and Trinity Colleges, Cambridge. They had still considerably over five thousand early charters in the library, including thirty-three of Saxon date. In the evening the annual business meeting was held at St. Augustine's College. A paper on "The Roads of Kent" was afterwards read by General Sir Charles Warren. The highways of the county were, he showed, subordinate to three special local influences, the forests of the Weald and Bleau, the estuaries and mud-flats about the rivers and the islands near the coast, and the line of chalk cliff, the lip of crater, surrounding the Weald. This last was the great highway east and west through Kent. On Saturday morning the members visited Chartham Church, and subsequently drove to the village of Chilham, where they inspected the castle keep, which adjoins the Jacobean mansion built by Sir Dudley Digges in the 17th century. An inspection of Chilham Church, built in 1534, concluded the excursion.

THE EDINBURGH ARCHITECTURAL ASSOCIATION. The annual excursion of the Edinburgh Architectural Association was made on Saturday to Hamilton. The Palace and Cadzow Forest were first visited, by permission of the Duke of Hamilton and Brandon. Mr. Henry F. Kerr, A.R.I.B.A., acted as leader. The lands of Cadzow, with its castle, formed a Royal barony, when the early Scottish kings repaired there for hunting down to the time of King Robert Bruce. The barony passed about 1323 into the hands of the Hamiltons, who acquired the tower of Orchard about a century and a half later. The barony was then erected into a lordship, and the name was changed from Cadzow to Hamilton. The tower of Orchard was gradually enlarged, and was known as Hamilton Castle. During the troublous times of Mary Queen of Scots the castle was besieged three times, after which the family was exiled. On the restoration of the Hamiltons to their estates, the castle was rebuilt from 1588 to 1591, and a portion of it is incorporated in the present building. In 1703-1705 extensive alterations were made, the great central gallery was formed, and the quadrangle wings were re-constructed. There is no record of the designer, but its style is influenced by the designs of Sir William Bruce, of Kinross. In later years William Adam was called in to make further additions to the building, but his designs were not carried out. In 1822 and subsequent years the north front was constructed, along with a new suite of apartments, from designs by David Hamilton, of Glasgow. The rooms contain many art treasures in furniture, china, and glass, while

the pictures comprise examples by Rubens, Holbein, Kneller, Lawrence, Reynolds, Gainsborough, Raeburn, and other famous artists. The mausoleum was completed in 1852 from designs by David Bryce, Edinburgh, and cost about £130,000. The octagonal chapel is lighted by a dome 120ft. high. On returning from Cadzow the gardens and old mansion of Barnclith were visited, by permission of Mr. William Bishop. The terraced gardens, formed about 1700, on the steep banks of the Avon, are at present being repaired and improved. The customary votes of thanks were proposed by Mr. T. Forbes MacLennan, A.R.I.B.A., president.

FACULTY OF SURVEYORS OF SCOTLAND.—At a special general meeting of members of the East District Section of the Faculty, held at 117, George-street, Edinburgh, on the 16th inst.—Mr. Alan K. Smith, F.F.S., chairman of the district section, presiding—a resolution was unanimously passed approving of the action of the west district section in declining to recognise the mode of measurement for joiner work prepared by the Scottish National Building Trades Federation.

SHROPSHIRE SANITARY INSPECTORS ON HOUSING REFORMS.—A meeting of the Shropshire branch of the Sanitary Inspectors' Association was held at Wellington on Saturday, under the chairmanship of Mr. Beville Stanier, M.P., Mr. G. Riley (surveyor and sanitary inspector, Wellington), read a paper on housing. There was no reason why local authorities should not put an end to the worst features of the present system of making new slums and work out their areas on garden city lines. The great task set housing reformers in this country should be tackled fearlessly. In designing a model cottage for general adoption the primary factors were good grouping and proportion suitable to the site so as to secure the maximum of sun and air in the living rooms and bedrooms with every possible comfort. The roads as far as possible should be laid out so as to run towards the north and south, thus giving east and west frontages for sunshine. The width of a road should in no case be less than 36ft. In 1901 the Wellington Urban Council began a housing scheme and built sixteen houses, containing living room, parlour, scullery, and three bedrooms. The dwellings were let at a weekly rental of 5s., including rates, and up to the present they had been self-supporting. In the present year the council started to build twenty-two houses, containing living room, scullery, larder, and three bedrooms, at a cost of £4,200, including land, buildings, fences, and roads. He was not in favour of subsidising any housing schemes out of the rates. It was a national question. Owing to local authorities being in a position to borrow money for long periods at a low rate of interest, the question of building houses for the working classes was now practically out of the hands of the private builder. Mr. J. W. Cliff, chairman of Wellington sanitary committee, said that in Shropshire there were 26,329 persons (25 per cent. of the urban population) and 30,647 persons (23 per cent. of the rural population) who lived in cottages with only two, or less than two, bedrooms. In the rural districts in 141 cases and in the urban districts in 185 cases there were from nine to thirteen persons sleeping in one or two bedrooms. Mr. Beville Stanier, M.P., pointed out that the money promised by the Government for housing was only a drop in the ocean. The cost of a cottage was from £190 to £200, and the grant from the Government would produce only 15,000 houses. A return showed that up to December 31 only 6,355 houses had been sanctioned for building in the country, and there was a shortage of 37,000. The State would have to take up the question, although he regretted that by doing so they would penalise the private builder.

UNIVERSITY COLLEGE.—The Donaldson Silver Medal, awarded by the Royal Institute of British Architects in connection with the work of the University School of Architecture at University College, has this year been awarded to Mr. Henry Nettleton Fisher.

Building Intelligence.

WALTON, SURREY.—The Bishop of London, chairman of the Whiteley Trust, visited on Tuesday Whiteley Park, near Walton, Surrey, an estate of 200 acres, where he laid the foundation-stone of the memorial to the late Mr. William Whiteley, which is to be erected in the middle of the village of cottage homes to be constructed in accordance with his will, by which he bequeathed £1,000,000 for the housing of the aged and deserving poor. The laying out of the site was based on the design of Mr. Frank Atkinson, F.R.I.B.A., selected in competition, in which a group of over 200 cottages in the form of an octagon will be the central feature. The church to be built on the property has been planned by Mr. Walter Tapper, F.R.I.B.A., while Sir Aston Webb, R.A., is designing the hall. The monument to be erected to Mr. Whiteley will consist of a figure of "Industry." On its pedestal will be a bronze plaque portrait and the coat of arms of the founder of the trust. The sculptor is Sir George Frampton, R.A., and the architect Mr. Walter Cave, F.R.I.B.A.

Mr. Horace B. Douslin has been selected for the office of Director of Public Works, Southern Rhodesia.

A new church is to be built at Abram, near Wigan. Mr. F. R. Freeman, of Bolton, is the architect.

The salary of Mr. C. W. Salt, borough electrical engineer of Torquay, has been increased by £50 per annum, with a further increase of £50 per annum at Midsummer, 1915.

The foundation-stone of a school-hall, attached to Eden-street Wesleyan church, Kingston-on-Thames, has been formally laid. Mr. A. Dawkins is the architect, and Messrs. Limpus and Son, of Kingston, are the builders.

The Local Government Board are asked by Bournemouth Corporation to sanction the borrowing of an additional loan of £4,000 for removing falls of cliffs and driving adits in the face of the cliffs for drainage purposes.

The housing committee of the city corporation of Newcastle-on-Tyne have approved schemes for building 138 workmen's dwellings, at an estimated cost of £25,000. The houses are to be erected in St. Lawrence-square and Walker-road.

The North Toronto drainage system, recommended by Mr. R. C. Harris, Commissioner of Works, has been adopted by the city council of Toronto. The entire work is to cost \$4,144,256, which includes provision for surface and domestic sewage.

The Roman Catholic Bishop of Shrewsbury, Dr. Singleton, has opened St. Edmund's Orphanage and Certified Poor Law Schools, which have been erected in Heath-road, Bebbington. The buildings have been erected at a cost of £7,600 from plans by Mr. E. Bertram Kirby, of Cook-street, Liverpool. The orphanage will accommodate 120 boys.

At a sitting of Norwich Consistory Court on Saturday application was made by the rector and churchwardens of Hingham, Norfolk, for a faculty to place a bust of Abraham Lincoln in the parish church, the cost to be defrayed by citizens of the United States. It will be a copy of the well-known Volk bust. The application will be further considered at the next Court.

A memorial to the brave French soldiers and sailors who, as prisoners of war, died in this country when we were at war 100 years ago, will be unveiled by Lord Weardale at Norman's Cross, Hunts, on the Great North Road, on Tuesday next, and handed over to the Lord-Lieutenant of Huntingdon. The memorial has been designed by the Vicomte de la Chapelle.

The Wiltshire Archaeological Society is in treaty with H.M. Office of Works to preserve the well-known mediaeval tithe barn at Barton Farm, Bradford-on-Avon, which threatens to fall into ruin. Sir Charles Parry Hobhouse, on whose estate the barn stands, has no further use for it, and is not prepared to spend the considerable sum entailed in its preservation. The Office of Works, which has the administration of the Ancient Monuments Act, will take charge of the barn and its preservation if it is handed over in proper order. The Wiltshire Archaeological Society have accepted the offer of the Office of Works to report as to what work is required on the barn, and will issue an appeal for carrying out the repairs.

Currente Calamo.

Little fresh has transpired during the week with regard to the London building trades dispute. Last Saturday night, at a meeting of the United Operative Plumbers' Society held in the Club Union Buildings, Clerkenwell, a resolution was passed declaring that no satisfactory purpose was to be served by continuing the building dispute, and recommending the members of the society to accept the terms offered by the London Master Builders' Association. Nothing further is announced yet. There was a small but rowdy demonstration in Trafalgar-square on Sunday, at which the demonstrators came to loggerheads with a rival meeting of "Industrial Workers of the World"—whoever they may be, who claimed priority of organisation and purpose. A newagency reports that there was talk of a fresh ballot of the members of the still stubborn unions at a meeting of the London Building Industries Federation on Tuesday, but nothing came of it. Meanwhile the meetings of the branches of the National Federation of Building Trades' Employers throughout the provinces are practically unanimous in favour of a general lock out. At Bolton on Monday, only five members voted against the resolution, at York 90 per cent. voted in favour, and at Manchester the figures were 89 to 6 in favour. There can be little doubt therefore that the necessary two-thirds majority will be announced at the meeting of the Federation at Cardiff next Wednesday, particulars of which will be found on another page.

We are glad to learn that the Beaux Arts Committee, taking into consideration the fact that the First Atelier now has its full complement of students, and feeling that the success of the First Atelier will be greatly enhanced, and the objects of the committee still further promoted, by the affording of opportunities for emulation and competition on similar lines, have decided to take immediate steps for the opening of a second Atelier in London. The committee are in negotiation for premises, and hope shortly to make some more definite announcement regarding the details of the scheme. In the meantime, those who wish for further information regarding this development should communicate with Mr. Adrian Berrington at the First Atelier, B. Wells mews, Oxford street, W., or of the Honorary Secretary of the Beaux Arts Committee, at 28, Bedford-square, W.C.

The Lumsden case has ended in a dead lock. Anyhow the House of Lords has decided nothing, and the judgment of Mr. Justice Horridge still holds the field. It was well known to every one outside the House of Lords, that the three judges of the Court of Appeal had been divided, only confirming the Court below by a majority, and that the matter was one of wide public interest, affecting the very basis of modern taxation. Yet the presiding Lord Chancellor did not see to it that there was an odd number of Law Lords, and the case by chance was heard by four. Naturally "the animals" went in two by two—but one couple one way and the other the other, and so all this legal learning and good money are simply wasted in words. Only in April a bench of seven judges sat in the House of Lords to decide a point on Workmen's Compensation.

There are plenty of qualified Lords about doing nothing, and surely one more could have been secured to make up five? Lord Moulton's judgment hit the mark Socratically when he put it thus: "Question: What is the increment of the site value of land when the value of the site has not changed? Answer: It is the difference of opinion of two sets of Government valuers as to the value of the owner's total interest in the estate! Could the force of absurdity go further?" In the clutch of this "reductio ad absurdum" we leave the matter for the present.

We are sick of the law in the Lumsden case. The empty comfort for builders is that the House of Lords cannot decide whether it is law or not. The Court of Appeal said it was, by two to one. Mr. Lloyd George, who long ago said it was not, professed his eagerness to make it plain that it was not in his Revenue Amendment Bill last autumn, and then withdrew that measure. There was a clause in this year's Revenue Bill which we are told made it clear that the Government was agreed that builders' profits ought not to be subject to a second taxation, and one which nobody else has to pay. That Bill, too, is now withdrawn. So we have no option but to pay and look pleasant till the coming general election; when if every builder no matter what his politics are does not remember that this Government has passively allowed Mr. Lloyd George thus unfairly to harass the second industry in the realm in a fashion unsurpassed by the most unscrupulous of past financiers, he will deserve canonisation as the personification par excellence of self-sacrificing meekness. Yesterday Mr. Chamberlain was to ask the Prime Minister "whether his attention has been called to the termination of the appeal in the Lumsden case, the House of Lords being equally divided; whether he has considered the judgment delivered, and in particular the observations of Lord Justice Moulton; whether he is aware that legislation was promised on this subject by the Government on August 1 of last year; and whether, as the Revenue Bill is dropped, the Government will introduce and press through the House a one-clause Bill, giving the promised relief to those who are affected by this decision?" Next week, doubtless, we shall have to record Mr. Asquith's favourite answer in the usual three words!

The Ministry of Fine Arts has not yet commended itself to Parliament. For the present, it seems, we are to have a Parliamentary Committee of members of both Houses interested in art. Lord Bryce, Lord Henry Bentinck, Lord Crawford, Lord Curzon, Sir Alfred Mond, Mr. Stephen Gwynn, Sir Herbert Raphael, Mr. Philip Snowden, M. A. A. Allen, and Mr. Almeric Paget have agreed to join the Committee, of which Mr. C. Montague Barlow is secretary. There can be no doubt about the scope of action for such a body, for the overdue report of the Committee that has been considering the questions of State grants to public collections and the better organisation of our galleries and museums may appear any day, and all friends of art hope that there will be a strong party in Parliament seriously to consider the recommendations of the Committee. Apart from this, there are questions affecting art education, public monuments, town planning, and the preserva-

tion of fine architecture which have long needed a more organised expression of public opinion in both Houses of Parliament.

The case of "Kirby v. Chessum," which has cropped up several times in our columns, has now got as far as the Court of Appeal (*Times*, July 17, 1914), having been first heard in October, 1913, by Mr. Justice Avory and a common jury. Upon the appeal, where the true issues seem to have been at last understood, there appeared to be very little in it. The plaintiff, as reversioner of a house at East Ham, sued the defendants as builders for trespass in reference to the underpinning of a wall. The defendants brought in the Commissioners of Works as third parties, liable to indemnify them, as the work was being done in regard to a post-office. The jury found a verdict for £20, and the judge decided against defendants on their claim to be indemnified. The Court of Appeal has now refused to order a new trial, although they said that the only damages proved came to 18s. 6d. But the verdict was not so unreasonably as to require the case should be tried all over again. As to the point of indemnity, the Lords Justices allowed the appeal, and so the builders make good their claim against the Commissioners of Works, whose architect gave them the order. The case was obviously one which an expert arbitrator should have settled in a couple of hours, with only the parties before him.

Some legal points of principle were raised; but it does not seem as if they had much to do with the result. The judge who tried the case was possibly not so well acquainted with the ways of architects and contractors. The whole business appears to have been confused, and it was, after all, something of a comedy of litigation. The builder should have obtained the consent of the tenant to underpin his wall, and then there could have been no trespass. Instead of this it was said that notice was to be given to the reversioner. But, as the Lords Justices said, such a notice would have been quite useless, for giving notice that you are going to commit a trespass does not make it any the less a trespass when it is done! As to the damages, the plaintiff got a new and good wall instead of an unsound one, and the only claim the Court of Appeal could discover was for 18s. 6d., cost of cutting through the added concrete, if necessary. There were three sets of solicitors and a good many counsel engaged in the case, which was entirely unfit for trial by a common jury. But as the heavy costs incurred will now apparently fall upon the Commissioners of Works, it will doubtless all work out well in the end.

Mr. Herbert Samuel, President of the Local Government Board, has promised to give the inaugural address to the members of the Summer School of Town Planning on Monday evening, August 3. The course will be held in the School of Architecture, University College from August 3 to 10. Although Germany rivals Great Britain as a pioneer of town planning, a good many foreign architects are attending this English school, as our housing system is being taken as a model by many growing towns on the Continent, whose people find their flat system more costly than our single houses. A group of students from the American schools of architecture are also attending.

Besides the courses of lectures by the leading English town planners, special lectures are arranged by well-known American and German professors of the subject. This Summer School initiates the study of town planning at the University of London. A professorship of municipal engineering has recently been founded, and a professor of town planning is also about to be appointed by the Senate.

We are glad to note the common-sense remarks of Sir William Church, the chairman of the executive committee, at the annual meeting of the Imperial Cancer Research Fund on Tuesday, at Examination Hall, with regard to the alleged existence of "cancer houses" and "cancer areas." Three instances which had been adduced of the existence of cancer houses had been investigated on the spot, and by abstraction of the data in the statistical office of the Registrar-General. In all three the complete data sufficed to show that a local cause had not induced an increased cancer mortality. In the report for this year, probably the most interesting feature is the scientific expert inquiry whether or not there was any risk of infection or contagion through the occupation of houses or rooms where cases of cancer had occurred. The result was an emphatic negative to the existence of any such risk. The fear was entirely groundless, and it is hoped that the public will be reassured by the evidence produced, and that sensational journals will cease publication of the statements made by people evidently ignorant of the real nature of cancer, which alarm readers and do serious damage to property owners. We suggest to the latter that a very reasonable ground of action exists against those who make and those who give currency to these wild but seriously damaging statements.

Many of our readers probably are familiar with the trend of the controversy during the past twenty-five years with regard to the right material for bell-frames, and with the reasons which many architects still give for their preference of wood to a cast-iron frame mounted on steel girders. The more intelligently an architect adheres to his predilection for oak, the more ready he will be to consider arguments to the contrary, when set forth reasonably and as the fruits of experience, as they are in a little volume, entitled, "Bell Towers and Bell Hanging: an Appeal to Architects," by Sir Arthur Percival Heywood, Bart., M.A., just published by Messrs. Longmans, Green, and Co. at two shillings. Sir Arthur, who is the President of the Central Council of Bell-Ringers, and a member of many kindred associations, is aided by contributions by Mr. Edwin H. Lewis, M.A.; Mr. E. Alexander Young, A.R.I.B.A., and others. Mr. Young's paper will probably appeal most directly to his brethren—the more so because at the outset he recognises the real reasons why some of us sometimes have to sin against knowledge. There is much else in his paper which more of us ought to know, but we are sorry to say, seem not to. Some fifteen years ago, as some will remember, Lord Grimthorpe, and Mr. Thackeray Turner, and Sir Arthur Heywood exchanged views in characteristic fashion with regard to metal versus wood frames, which, with other more or less interesting matter, are given in the appendix.

The Public Library of the City of Boston, Mass., U.S.A., has issued a new edition of

its catalogue of books relating to Architecture, Construction, and Decoration, with an additional section on City Planning. The previous edition was published in 1894; but since then the collection of architectural books had increased so largely that the preparation of a new edition became imperative. The work has occupied five years, and the Boston Society of Architects and other friends contributed 500 dollars towards the cost, the section on City Planning being prepared by Mr. Frank A. Bourne. The price is one dollar, plus postage; the weight of the catalogue is 40oz. ready for post. The work is most creditable to all concerned, and the City of Boston is to be congratulated on its publication and its acquisition of so varied and extensive a collection of architectural literature. No English city has had the good fortune, or the enterprise, to acquire such a library, or to make its extent and value so usefully known. This second edition is a closely-printed octavo volume of 536 pages, with classified lists arranged under such headings as bibliography, dictionaries, history and theory, periodicals (in which the BUILDING NEWS figures from Vol. XV., 1868, to the present date), periods and styles, architecture of countries, illustrations of buildings (the largest section of all), architectural and technical details, decoration, handbooks, etc. An additional section of this edition relates to city planning. The work of cataloguing and indexing has been very thoroughly and accurately carried out. The Public Library Building at Boston, it will be remembered, was built between 1888 and 1895, from plans by Messrs. McKim, Meade, and White, of New York, at a cost of £473,000 sterling. Before it was completed its accommodation, originally provided for 750,000 volumes, was found to be inadequate.

The old Infirmary site at Manchester has been the cause of as many searchings of heart as the divisions of Reuben, and the climax, possibly, was reached yesterday week, when Mr. W. Phillips, an ex-councillor of the city, appeared before the Manchester stipendiary magistrate on a charge of having defaced a public building by writing on the walls of the Temporary Reference Library, on the old Infirmary site, the words "Our Disgrace." Evidence of the offence having been given, Mr. Phillips protested that, having served on the libraries committee for three years, he knew all the members were convinced it was a disgrace. He submitted that the offence was not necessarily defacing. The word "defacing" meant to destroy or injure the beauty of anything. It was absolutely impossible to say there was any beauty about the buildings on Piccadilly. "In the interests of the public and in the interest of the dignity of the city," said Mr. Phillips, "I have done this, because I feel that our city is being disgraced by a part of the old Infirmary site being used for this temporary library. We have little or no sentiment in our city, and I feel that this was the only opportunity I had. Without doing any damage to the building or to anyone, and without defacing the building in the true sense of the word—for I used whitewash instead of paint, in order that it might be washed off easily—I did it because I do feel a protest was called for. We are absolutely lost, it seems to me, to the sense of our true responsibility. The site was practically given to the city for a purpose well understood between the parties, and it does seem to me that a protest like this is called for. We have the money to

make this a beautiful site," he said. "We know exactly what ought to be done, and here we have it an absolute wilderness. I feel I am acting the part of someone who in years gone by wrote with a finger on the wall 'Mene, Mene, tekel, upbarsin'—'Weighed in the balance and found wanting.' I thought I was doing a little handwriting on the wall." The stipendiary magistrate was afraid Mr. Phillips had broken the law, and fined him 5s. and costs.

The town council of Pittenwee have adopted plans by Messrs. Haxton and Walker, of Leven, for the town-hall. The estimated outlay is £11,050.

The Bradford Education Committee are about to build a secondary school at Bolling Hall for 435 girls, at an estimated cost of £53 per scholar, exclusive of site and playing-field.

At Winnipeg, tenders are invited for the erection of the engineering building of the University of Manitoba. The estimated cost is 250,000dol. The plans were prepared by Mr. V. W. Horwood, 261, Fort-street, Winnipeg, Messrs. Brown and Vallance, Montreal and Winnipeg, are the consulting architects.

In the course of the excavations on the site of the old General Post Office in St. Martin's-le-Grand, some interesting discoveries of Roman fragments have been made. The relics unearthed include fragments of pottery (some with the potter's stamps), glassware, plastic figures, spokeshaives, coins, frescoes, writing-tablets, building materials, lamps, fibulae, and tile stamps.

No. 1, Abbey-road, St. John's Wood, for many years the residence of the late Mr. John W. McWhirter, R.A., has been acquired by the Lady Workers' Home, Ltd., as part of a scheme for providing women workers with small flats. Plans are before the London County Council for erecting a building on two sides of the gardens, to provide about 120 additional bedrooms, with central heating and bathrooms. It is also intended to build, subject also to the approval of the London County Council, 26 self-contained flats.

The Kensington Borough Council is recommended by its works committee to offer strong opposition to a proposal by the Highways Committee of the London County Council to obtain powers to link up the tramway system at Shepherd's Bush with that at Hammersmith Broadway by laying a new tramway through Holland-road, Kensington-road, over Addison-road Bridge, and along Hammersmith-road. The borough council of Paddington are also recommended to refuse consent to the L.C.C. proposal for linking up the tramways in Harrow-road.

The church of St. Peter in Eastgate-with-St. Margaret, Lincoln, has been restored and enlarged at a cost of about £4,000, and the Bishop of the diocese has dedicated the new south aisle and the chapel of St. Margaret. The chancel has been restored and extended westward to the first bay of the nave, and the choir-stalls have been moved westward correspondingly. A roof-screen of oak, with open tracery panels, and having a vaulted cope on both east and west sides, has been erected, and this is surmounted by a roof bearing the figures of the Saviour, the Virgin, and St. John.

Mr. T. H. Mawson's preliminary studies for the new city plan of Athens are now so far advanced that he has submitted them to the Queen of the Hellenes at Eastbourne. The plans incorporate many personal ideas which the King and Queen of the Hellenes have for years been desirous of seeing carried into effect. Considerable improvements are also being planned on the estate of their Majesties at Tatou, a well-wooded property among the hills a few miles from Athens. Work is also proceeding on the gardens surrounding the two Royal Palaces in the city to the designs of Mr. E. Prentice Mawson.

A working-class housing scheme, promoted by the Southgate Urban District Council, involving an outlay of £40,463, was inquired into by a Local Government Board Inspector at Palmers Green on Monday. Mr. C. G. Lawson, the surveyor to the council, explained that the scheme provided for 160 houses, comprising 17 to be let at 8s. a week inclusive, 84 at 7s., 14 at 7s. 6d., 31 at 5s. 6d., and 14 tenements (divided into 28 flats) at 4s. a week each. All the houses would be equipped with cupboards, baths, and every up-to-date sanitary and other convenience. The roads on the estate would be 40ft. wide, the distance between the buildings being 80ft. At present, out of 9,000 houses in the district, there were only 335 suitable for working-class occupation. There was no opposition to the scheme.

Correspondence.

ARCHITECTURAL TOUR IN SOUTH FRANCE.

To the Editor of the BUILDING NEWS.

SIR,—Will you kindly grant me space in your Correspondence columns in which to draw attention to the fact that the final arrangements for the above tour are now being made, and that those desirous of attending should send in their names as soon as possible?

The tour will start on August 31, and the following places will be visited:—Poitiers, Limoges, Perigueux, Cahors, Conques, Rodez, Rocamadour, Cordes, Carcassonne, Nîmes, Arles, Avignon, Orange, Le Puy, Isoire, and Clermont Ferrand.

In order to obviate any possible misunderstanding, I may say that the tour is open to all interested in the study of architecture, whether ladies or gentlemen. I shall be glad to send further particulars of the tour to any desiring them.—I am, etc.,

W. S. PURCHON, Lecturer in Architecture.
The University, Sheffield, July 19.

LICENTIATES AND THE R.I.B.A. CHARTER.

SIR,—The five Associates, whose letter you published last week, should remember that amongst those who have "toiled not," etc., are numbered over 600 (out of 850) Fellows, and are 100 Associates of the Institute. They have, nevertheless, obtained their distinctions.

On the merit of qualifying examinations, do those five Associates claim superiority from the Presidents of the Institute for the last 15 years? Or do they suggest these distinguished gentlemen, with a host of others which the R.I.B.A. have been pleased to freely admit from the "outside" ranks, are exceptions unlikely to be a product of the future?

Apart from the fact that the "Associate" degree is one obtainable without necessarily producing one building, or, indeed, being in practice at all; it is not for their class to claim higher consideration than architects in active conscientious practice—the greatest qualifying course of all.

Steps towards reform must be initially unselfish, based on sounder arguments than this and directed towards cohesion of spirit, as it is a question whether freedom of study has not in the past been as productive of good results as any prescribed course.

Certainly to those in the outside majority who are devoting their lives to the profession of architecture in the able pursuance of their own practices, the future should hold something more than a lower status from that proposed to be held by a class, members of which it is common for them to employ as assistants.

In their apt quotation, the Five Associates should "consider" those who have "toiled not," but who, nevertheless, have "arrayed" themselves in "glory."—We are, etc.,

NOT EVEN LICENTIATES.

The partnership hitherto subsisting between L. Nagington and A. E. Shennan, architects and surveyors, Dale-street, Liverpool, under the style of Nagington and Shennan, has been dissolved.

Mr. F. R. Gibbins, B.Sc., a son of the surveyor to the Northampton Borough Education Committee, has been appointed engineer and surveyor to the Cheadle and Gatley Urban District Council.

After much discussion the town council of Margate have decided by 14 votes to 9 to purchase the Hotel Metropole, inclusive of all fixtures and fittings, for £12,000 for adaptation to use as municipal offices.

Major J. Stewart, Inspector of the Local Government Board, held an inquiry at Brierley Hill on Friday into the application of the urban district council for sanction to borrow £6,600 for the purchase of Brierley estate. Of the area of thirty-eight acres, twelve acres will be utilised as a burial-ground, and a considerable portion of the remaining land may be used as sites for workmen's houses.

STATUES, MEMORIALS, &c.

THE KING EDWARD MEMORIALS.—A meeting of the Advisory Committee of the King Edward Memorial Fund was held at the Mansion House on Monday. Amongst those present were Earl Beauchamp, First Commissioner of Works; Mr. Cyril Jackson, representing the London County Council; Sir Homewood Crawford; and Mr. Leonard Stokes, ex-President of the Royal Institute of British Architects. The Right, Hon. Sir Vezey Strong, who presided, said that the Committee had purchased and paid for, at the expense of £70,000, the site of the Shadwell Fish Market on the banks of the Thames. The engineering and architectural plans and specifications to convert this property into a park for East London were well advanced; but the Committee found themselves in difficulty in facing the expenditure involved—about £40,000—in laying out the property, owing to the unexpected failure of one of the subscribers, who had been overtaken by misfortune, and thereby prevented from making a promised contribution of £25,000. Some of the wealthier friends of King Edward had given them generous additional contributions, and the London County Council were willing to commute for about £15,000 an annual rent-charge on the property of £710. The fund now amounted to £76,000; but they were still about £20,000 in arrear, and if during the next few weeks it was not forthcoming from private sources, a further public appeal would become absolutely necessary. The equestrian statue of the King to be erected in Waterloo-place was now in course of execution by Mr. Bertram Mackennoel, A.R.A. The committee, after approving the chairman's statement and action, adjourned.

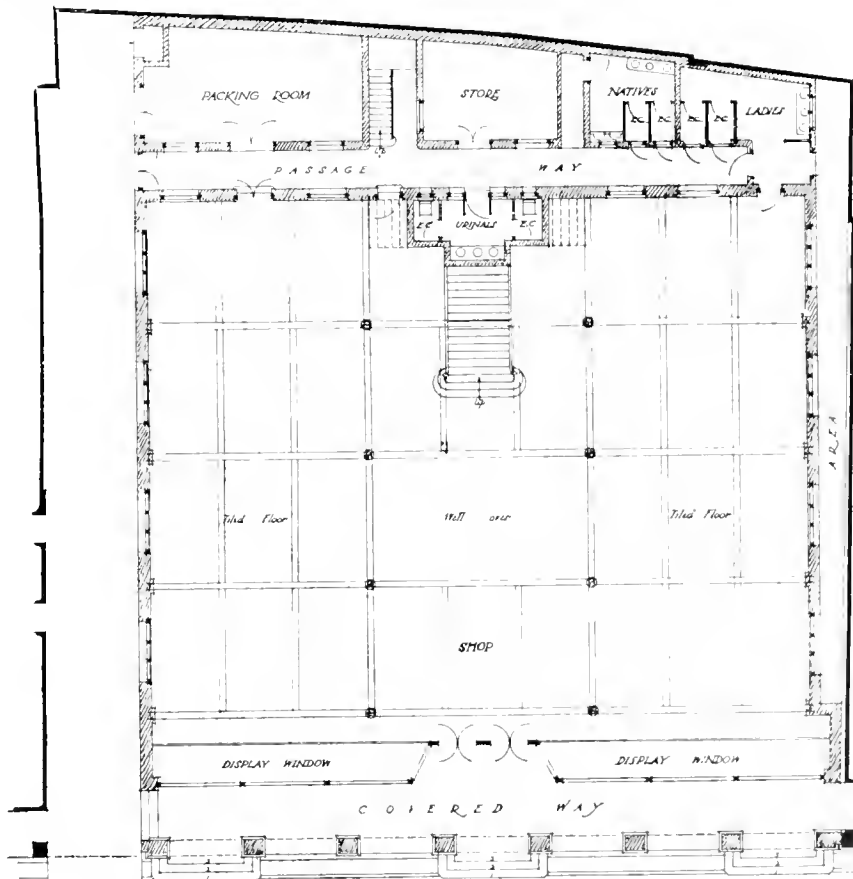

Our Illustrations.

NEW PARISH HALL AND VICARAGE OF ST. MARK'S, LEWISHAM.

These buildings are in course of erection on the west side of the Clarendon-road, and nearly opposite the Church of St. Mark. The hall will seat 300 persons, and is planned with a wide vestibule and cloakrooms next the entrance, and retiring-rooms on either side of the platform, with a passage behind to connect them. On either side of the hall at the platform end exit to lobbies are provided, which also form direct entrances to the retiring-rooms. The vicarage will contain three sitting-rooms and six bed- and dressing-rooms, with the usual offices. Both buildings are being faced with brown Sussex stock bricks; the upper part of the vicarage will be finished with pebble-dash, and Portland stone will be sparingly used for the dressings. The roofs will be covered with red hand-made tiles. Mr. E. J. Saunders, of Croydon, is the contractor for both buildings, and Messrs. Strode and Co., Ltd., are carrying out the hot-water heating for the hall. The architects are Messrs. F. H. Greenaway and J. E. Newberry, of Westminster.

NEW DRY GOODS STORE, PENANG.

These premises are now being erected in Bishop-street, Penang, for Messrs. Whiteaway, Laidlaw, and Co., Ltd., from the

NEW DRY GOODS STORE, PENANG.

A public hall, seated for 5,000 persons, is to be built on the site of the skating rink in West-gate-street, Cardiff. The architects are Messrs Willmott and Smith.

A Local Government Board Inquiry was held at Penzance on Friday by Mr. W. O. E. Meade King, an inspector, relative to the application of the town council to borrow £1,355 for the provision of public conveniences in Morrab-gardens, Alexandra Grounds, and of offices and conveniences in the eastern end of the Market House.

designs of Messrs. Herbert O. Ellis and Clarke, architects, of 46, Fenchurch-street, E.C. They comprise large selling spaces on ground and first floors, with go-downs, tiffins, etc., at the back of site. The construction throughout is fire resisting, the floors being of steel and concrete, the surface being laid with tiles, while the walls are of Chinese bricks faced with cement. The pier-forming the arcade are of granite up to the springing of the arches. The steelwork, shop front

floor tiles, ornamental ironwork, and all hardware have been sent out from London. The building is being erected by a Chinese contractor.

"BUILDING NEWS" DESIGNING CLUB: A SMALL CREMATORIUM FOR A COUNTRY TOWN.

(These designs are described in our referee's report thereon on pages 100-102.)

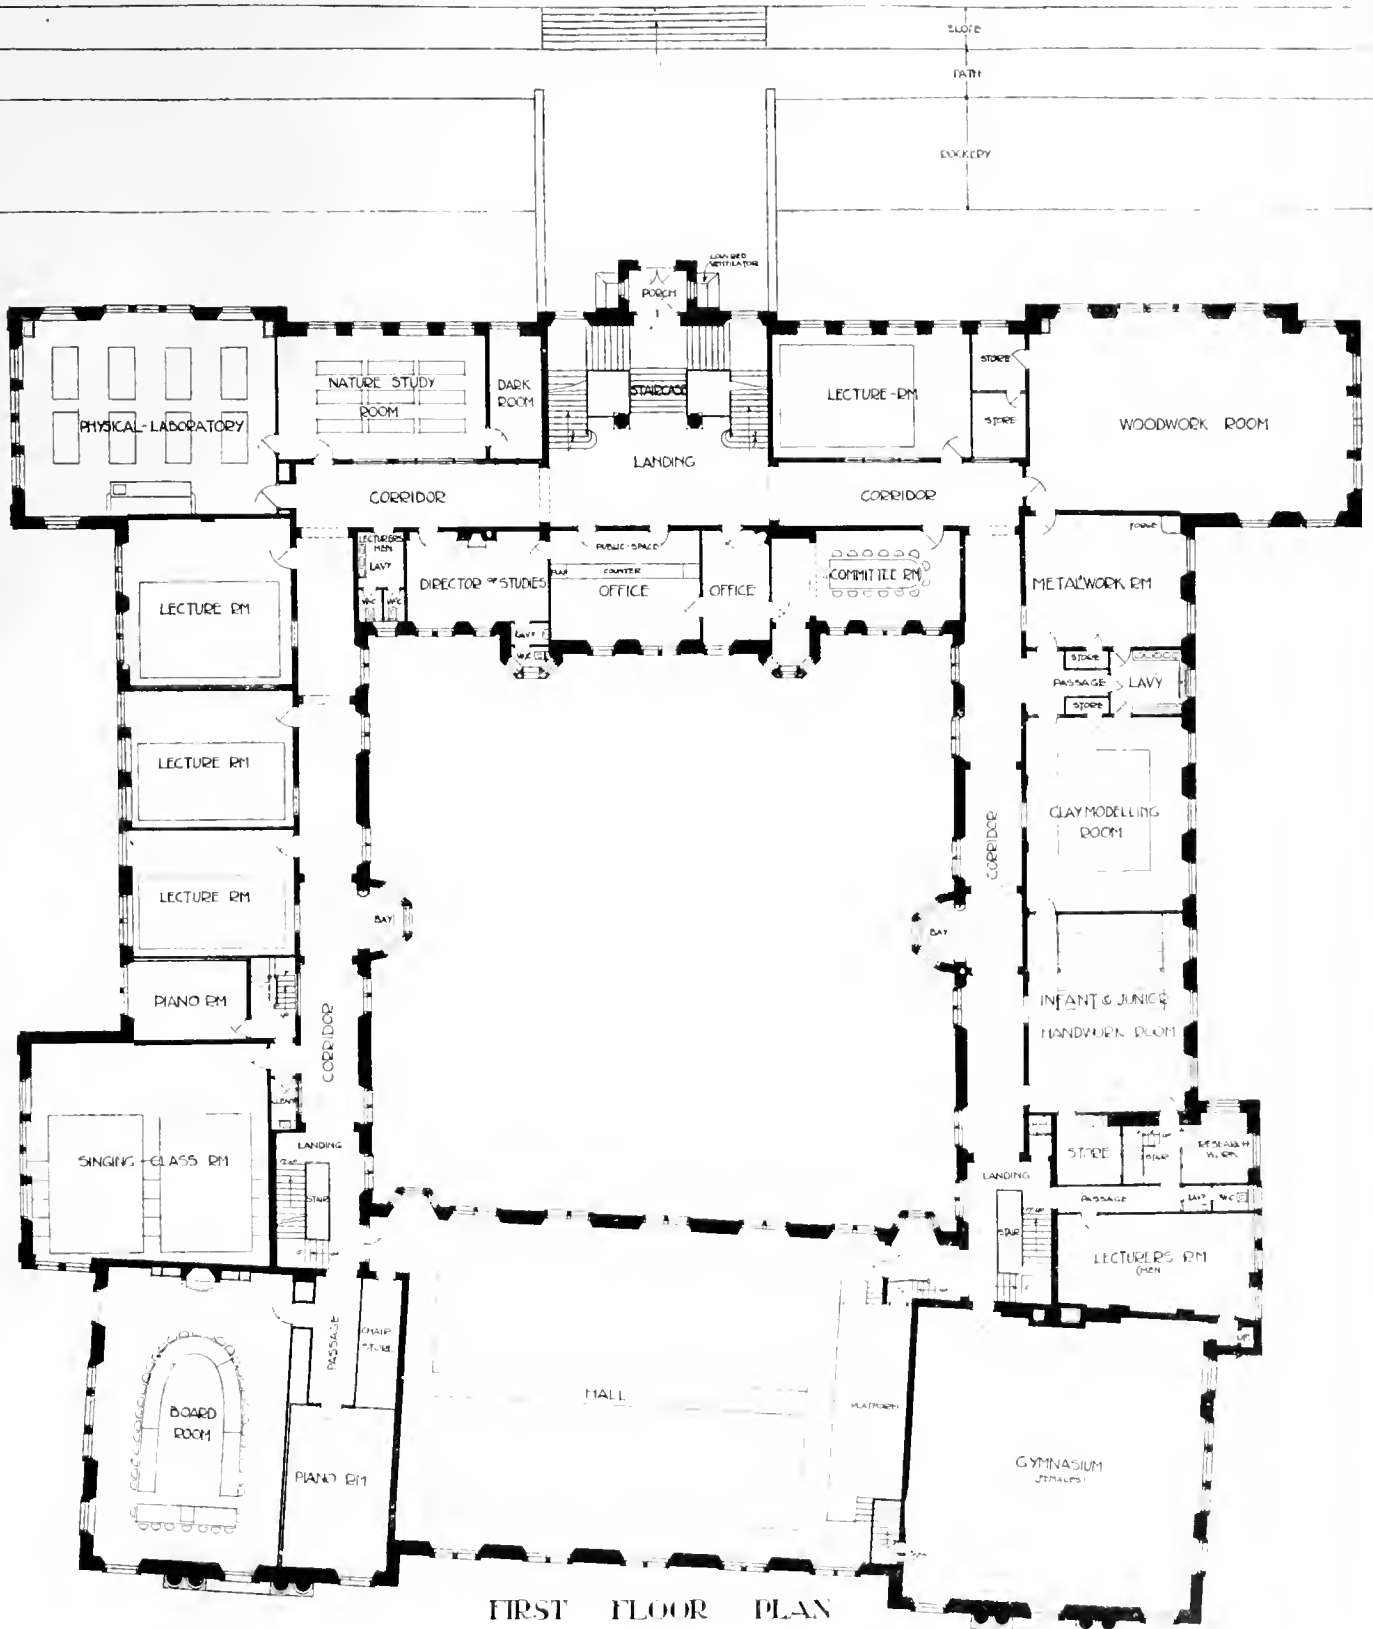

EDINBURGH PROVINCIAL TRAINING COLLEGE FOR TEACHERS, CANNONGATE.

The Edinburgh Provincial Training College for Teachers, which, apart from the demonstration school, will very shortly be completed, has been erected on a site behind Old Moray House, in the Canongate. It contains

numerous lecture-rooms, laboratories for science, nature study, psychology, and pedagogy; art rooms, handwork rooms, three large gymnasias, library, hall for 800, dining-hall, and common rooms for the students. In addition accommodation is provided for medical inspection, the director of studies, principal and the administrative and teaching staff. Several rooms are fitted for lantern-work, while the large hall is equipped for cinematograph displays. The heating is by means of low-pressure hot water, and cross-ventilation between the classroom and corridor windows is provided, augmented by extract ducts leading to fan chambers in the roof. The estimated cost was £53,500, including furnishings and professional fees. The architect is Mr. A. K. Robertson, of the firm of Messrs. Robertson and Swan, A.R.I.B.A.,

Hanover-street, Edinburgh. The committee are uniting with other Edinburgh educational bodies in a scheme for the provision of hostels for women students on a suburban site at Craigmillar Park, at an estimated cost of £89,000, the plans being prepared by the same architect. When the new hostels are available the present hostels, situated behind the new college, will be removed, to provide a site for the demonstration school, which is estimated to cost £14,750. We give two plans of the building, with views of the main front and quadrangle entrance, also the quad side of hall and interior of library.

The Royal Architectural Institute of Canada will hold its seventh annual meeting at Quebec, September 21-22. The hon. secretary is Mr. Alcide Chausse, 3, Beaver Hall-square, Montreal.

EDINBURGH PROVINCIAL TRAINING COLLEGE FOR TEACHERS, CANYONGATE.

CHIPS.

A scheme of housing for the working classes at Colwyn Bay, on garden village lines, drawn up by Mr. William Jones, surveyor to the urban district council, and estimated to cost about £20,000, has received the approval of the Local Government Board.

Professor S. D. Adshead, honorary M.A. (Liverpool), F.R.I.B.A., has been appointed as from September 1, 1914, to the University part-time Chair of Town-Planning, tenable at University College. Since 1909 Mr. Adshead has been Professor of Town-Planning at Liverpool.

Sir Thomas Barlow on Saturday opened the King Edward VII Memorial Nurses' Home erected in the grounds of Bolton Infirmary at a cost of £10,000.

The Local Government Board have given full sanction to the Wallasey Corporation for the borrowing of £64,500 for the new electric generating-station at Poulton.

A group of science buildings are about to be added to the University buildings at Vancouver, British Columbia, from plans by Messrs. Sharpe and Thompson, of London-building, in that city. The estimated cost is over £100,000 sterling.

The new library which has been erected by the Deptford Borough Council on Lewisham High road, at a cost of over £12,000, exclusive of £5,000 paid for the site, was opened on Saturday afternoon by the Mayor.

In response to the appeal on behalf of the memorial fund to the late Sir Robert Hunter a sum of about £1,000 has been collected, and the committee has decided that this amount shall form a permanent fund vested in trustees. The interest of this is to be applied from time to time to assisting schemes in connection with open-space movements.

GUINEAS FOR BEST REPLIES.

We offer a prize of one guinea every week for what we deem the best reply to any query appearing in this column, which we deem worth insertion.

Replies must be sent in over real name and address. No others can receive a prize. The Editor's judgment is final.

This competition is restricted to buyers of the paper, and with each reply a coupon cut from our front page must be enclosed.

Any number of replies can be sent, but a coupon of this date must accompany each.

All else being equal, brief replies will stand the best chance. We emphasise this, as some correspondents ignore the fact that querists want terse facts, not long essays. Any necessary illustrations must be in line only—no tints or washes—and about twice the size they are meant to be reproduced. We are unable to avail ourselves of replies that contain illustrations unless we receive them by first post on Tuesdays.

The right to withhold the prize in the event of no reply being received worthy of it is reserved by the Editor, who also claims the right to publish any other replies he may deem useful.

We divide the guinea between the authors of the two replies printed.

REPLIES.

[13146].—STRESSES.—The "method of sections" can be employed to find the stresses in the four bars of the roof truss shown. This method, however, is apt to be rather confusing to the student, though its fundamental

obtain the stress in bar 5-15, take moments about E, see Fig. 1a. The following are the data used for calculations:—Reaction at A = 127.4cwt. By resolving the two component forces given for wind and dead load, we get results as follows:—Load 1-2, 17.5cwt.; 2-3, 31cwt.; 3-4, 31cwt.; 4-5, 34cwt.; 5-6, 34cwt. Now, following Fig. 1a, we know the algebraical sum of the moments of all the forces acting round E equals zero. Hence, the following equation—

$$\text{Stress in 5-15} = 127.4 \times 18.6 - 17.5 \times 18.16 - 34 \times 12.3 - 34 \times 6.6 - 34 \times 8 + S_{15} 14 \times 6.0 + S_{13} 15 \times 6.8 = 0.$$

Taking stress in bar 15/14 to equal 34cwt., then—
 $2369.64 - 317.8 - 416.5 - 224.2 - 27.2 + 204 = 6.8 = 234\text{cwt. compn.}$

To find stress in bar 15-14, take moments about A, see Fig. 1b, allowing stress for bar 14-13 to be 55cwt., then—

$$127.4 \times 0 + 17.5 \times 0 + 34 \times 6 + 34 \times 11.7 + 34 \times 17.5 - S_{14} 13 \times 17.6 + S_{15} 14 = 0, = 33\text{cwt. tension.}$$

For stress in bar 11/17: Take moments about A, see Fig. 1c.

$$127.4 \times 0 + 17.5 \times 0 + 34 \times 6 + 34 \times 11.7 + 34 \times 17.5 + S_{15} 14 \times 9 + S_{14} 15 \times 15 + S_{17} 8 \times 2.75 = 0.$$

Allowing stress in S₁₅ to be 103cwt., we get S₁₄/17 to be 119cwt. tension. To find stress in bar 17-8, refer to Fig. 1d. By taking moments about C, we get—

$$127.4 \times 23.5 - 17.5 \times 23.5 - 34 \times 17.5 - 34 \times 11.5 - 34 \times 6 - 34 \times 3 - 119 \times 3 - S_{17} 8 \times 9 = 0, = 104\text{cwt. tension.}$$

These results can easily be checked by a stress or reciprocal diagram.—O. Lewis Abbott, City Surveyor's Office, Town Hall, Manchester.

[13146].—STRESSES.—The method of sections can be employed in determining the stresses in the four bars of the roof-truss shown in diagram, cut by section line

of truss and the bar T. Then taking moments round axis O, i.e.—
 $Rr - W_1 X_1 - W_2 X_2 - W_3 X_3 - W_4 X_4 - W_5 X_5 = Tt \dots\dots\dots(1)$
 $r = \text{vertical distance from R to axis O}$
 $t = X_1, X_2, X_3 \dots\dots\dots = \text{vertical distances from the respective forces } W_1, W_2 \dots\dots\dots \text{ to axis O.}$

Second, take the section line I/I and moments round axis O, i.e.—

$$Rr - W_1 X_1 - W_2 X_2 - W_3 X_3 - W_4 X_4 - Tt = Hh \dots\dots\dots(2)$$

Forces D and K pass through axis have no moments. It was found in equation (1).

$$h = \text{vertical distance of force H from axis O}$$
$$\therefore H = \frac{Rr - W_1 X_1 - W_2 X_2 - W_3 X_3 - W_4 X_4 - Tt}{h}$$

In a similar way the stresses in bars D and H can be found.—A. Twiney, 15, Ashfield-road, Rusholme, Manchester.

principle is simply the "theory of moment," with which the student of mechanics very soon becomes acquainted. The actual principle upon which this method is based, and proved in mechanics, is: If a series of forces be in equilibrium, the algebraic sum of the moments of all the forces acting in one plane, and to either side of any section, and about any point in that plane, must be zero. Fig. 1 represents the roof and its bars; the thick lines represent members in compression, the thin ones tension. I-I is the line cutting the four bars whose stresses it is desired to compute. To

find the stress in bar 5-15, take moments about E, see Fig. 1a. The following are the data used for calculations:—Reaction at A = 127.4cwt. By resolving the two component forces given for wind and dead load, we get results as follows:—Load 1-2, 17.5cwt.; 2-3, 31cwt.; 3-4, 31cwt.; 4-5, 34cwt.; 5-6, 34cwt. Now, following Fig. 1a, we know the algebraical sum of the moments of all the forces acting round E equals zero. Hence, the following equation—

The salaries of Mr. E. L. Morgan, borough engineer, and Mr. W. J. Smith, gas engineer to the Bolton Corporation, have been increased by £75 and £100 per annum respectively.

At the last meeting the city council of St. Albans approved of a scheme prepared by Mr. H. Howard Humphreys for sewerage the areas recently added to the city. The estimated outlay is £48,976, exclusive of surface-water drains.

LEGAL INTELLIGENCE.

THE LUMSDEN APPEAL—CALCULATING INCREMENT VALUE DUTY: THE HOUSE OF LORDS DIVIDED.—In the House of Lords on Monday judgment was delivered by the Lord Chancellor and Lords Shaw, Moulton, and Parmoor in the important test case of *Lumsden v. The Commissioners of Inland Revenue*, deciding the basis upon which increment value duty under the Finance Act of 1909-10 is to be assessed. The issue decided was whether the appellant, Robert John Lumsden, was liable to pay increment value duty upon the occasion of a sale by him of a house and shop, No. 32, Lausdowne-road, Forest Hall, Northumberland. The appellant was charged a gross duty of £25 in respect of an alleged gross increment value of £125. The question depended mainly upon the construction of sections 2 and 25 of the Finance (1909-10) Act, 1910. On Lumsden's appeal against that assessment the Referee decided in his favour, and held that on the true construction of sections 2 and 25 no increment value was payable. The Commissioners then appealed in turn, when Mr. Justice Horridge, reversing the decision of the Referee, decided the question in favour of the Crown, and his decision was affirmed by the Court of Appeal (the Master of the Rolls and Lord Justice Kennedy), Lord Justice Swinfen Eady dissenting. Sir Robert Finlay, K.C., and Mr. W. Allen appeared for the appellant; and the Attorney-General (Sir John Simon, K.C.), the Solicitor-General (Sir Stanley Buckmaster, K.C.), and Mr. William Finlay for the respondents. The appeal was argued in June last. In the final judgment, pronounced on Monday, the Lord Chancellor and Lord Shaw were of opinion that the appeal should be dismissed, and Lord Moulton and Lord Parmoor were of opinion that it should be allowed. The House being equally divided in opinion, the decision of the Court of Appeal in favour of the contention of the Crown stands.

THE LORD CHANCELLOR'S JUDGMENT.

The Lord Chancellor, in moving that the appeal be dismissed, observed that the appeal raised a question of much difficulty which had been the subject of elaborate argument at the Bar. But the real point lay within narrow limits, and turned on the proper construction of a few words in the Finance (1909-10) Act, 1910. The sections of that Act relating to duties on land values had obviously been drafted with remarkable skill. But the subject was so novel, and so complicated, that it was inevitable that questions should arise on which the meaning of the Legislature had not been made wholly free from ambiguity. The duty of a Court of Construction in such cases was not to speculate on what was likely to have been said if those who framed the statute had thought of the point which had arisen; but, recognising that the words left the intention obscure, to construe them as they stood, with only such extraneous light as was reflected from within the four corners of the statute itself, read as a whole. The appellant had been held liable for increment duty arising upon the occasion of a sale by him of a dwelling-house and shop. By the Act of Parliament the duty was charged on the increment value of land. That increment value was the amount by which what was called the site value exceeded, on the occasion on which the duty arose, the original site value. Such was the effect of sections 1 and 2. Before referring further to the provisions of section 2, which gave a special meaning to site value on that occasion, it would be convenient to turn to the later sections to see what various values meant when spoken of generally in the Act. By section 26 a valuation of all land was to be made, showing separately the total value and the site value. Those were defined in section 25, together with two other values. The first of the four values there defined was gross value, which meant the amount which the fee simple of the land, if sold in the open market by a willing seller in its then condition, free from encumbrances and from any burden, charge, or restriction (other than rates and taxes), might be expected to realise. The second value was full site value, which meant the value which the fee simple, if similarly sold, might be expected to realise if the land were divested of all buildings and structures appurtenant to such buildings, and of all growing timber and other things growing on the land. The third value was total value, which meant the gross value after deducting the amount by which that gross value would be diminished if the land were sold subject to any fixed charges (afterwards so defined as to exclude mortgages) or public rights of way, or user, or rights of common, or easements, or certain kinds of restrictive covenant or agreement. The fourth value was assessable site value, which meant the total value after making various deductions. These included the same amount as was to be deducted for the purpose of arriving at full site value from gross value, and also value directly

attributable, in the case of a non-agricultural property such as that under consideration, to roads. There were other deductions to be made from total value in arriving at assessable site value, but those need not at present be considered. The section also provided towards its close that any reference in the statute to site value, other than a reference to it on an occasion on which increment duty was to be collected, was to be deemed to be a reference to assessable site value as ascertained in accordance with the section. Turning back to section 2, it first enacted that the increment value of any land was to be deemed to be the amount by which the site value, on the occasion on which increment value duty was to be collected after being ascertained in accordance with that section, exceeded the original site value ascertained in accordance with the general provisions of the Act as to valuation. The section then provided that the site value on the occasion on which increment duty was to be collected was to be taken to be, where, as here, the occasion was a transfer on sale of the fee simple, the value of the consideration for the transfer. He observed that among the other enumerated occasions were the periodical occasions on which the duty was to be collected in respect of the fee simple of land held by a body corporate or unincorporate, in which cases the total value was to be estimated in accordance with the general provisions as to valuation to which he had already referred. In all those instances the site value thus defined was to be "subject in each case to the like deductions as are made under the general provisions of this part of the Act as to valuation for the purpose of arriving at the site value of land from the total value." The appellant contended that the expression "like deductions" meant where the case was one of transfer on sale, that deductions were to be made from the value of the consideration in their character resembling or analogous to, but not identical in amount with, those which were made when, under the general provisions as to valuation, site value was ascertained from total value. The argument on his behalf was that, in applying the analogy of the process of deduction prescribed by section 25 for the ascertainment of assessable site value, you were to start from the amount of the value of the consideration as though it were a total value, and then make the kind of deductions that were prescribed in section 25, where the start was made from total value which was merely estimated. The respondents, on the other hand, contended that the words "like deductions" were not ambiguous. They pointed to the language of section 25 (4) (a) as defining the first deduction to be "the same amount as is to be deducted for the purpose of arriving at full site value from gross value." They argued that there was therefore, no room for making any other deduction than this varying amount which was to be, if they were right, ascertained with reference, not to the value of the consideration, but to the difference between the estimated gross and full site values. He must now refer to the facts out of which the appeal had arisen. The Referee under the Act stated a special case. He found that the consideration for the transfer on sale was £750, and that the fee simple had been sold subject to title of £33 capital value. He found, further, that the amount of deduction to be allowed under section 25 (4) for the making of roads was £90. He also found that at the time of the sale the fee simple of the property, if sold in the open market by a willing seller in its then condition free from encumbrances and from any burden, charge, or restriction other than rates and taxes (the words of the subsection defining "gross value"), might have been expected to realise £658. It was admitted that there had been no variation in the full site value between April 30, 1909 (the date as on which the original valuation had to be made) and August 23, 1910, the date of the sale. It was agreed that the full site value was £228 on each date. The original assessable site value was £105. On these findings the appellant maintained that the deductions directed by section 2 to be made from the value of the consideration must be made from the £750 and £33 (the amount of the capital charge for title), in order that the analogy of the deduction from gross value might be followed. As the full site value at the time of sale had by admission remained at £228, the difference between gross value and full site value must be taken to be £555. Therefore, on the footing that the sale price of £750 was to be taken as representing the total value for the purpose of ascertaining the proper deductions, it was from this figure that the £555 must be deducted and this subtraction, after allowing £90 as a further deduction for roads made, resulted in an assessable site value of £105. There was, therefore, no increment value. For, according to the original valuation which was annexed to the Referee's report, the original gross value was £658, the original total value that amount minus the £33 capital value of title—i.e., £625—the original

full site value £228, and the original assessable site value £105, the same amount as on the occasion of the sale. The respondents challenged this basis of calculation, contending for a different construction of section 2. Accepting the figures, they said that as the gross value had been found at the time of the sale to be £658, and the full site value to be £228, the difference really prescribed by the Act of Parliament was £430. They maintained that, on the facts found, there could be no further deduction, the gross value having been so found, excepting the £90 for roads, and that the total amount of deduction from the £750 was therefore £520, which gave a site value of £230, and resulted in increment duty being exigible on the difference between this and the original site value of £105. The Referee took the view of the appellant. On appeal Mr. Justice Horridge disagreed with the Referee, and adopted the contention of the Crown. In the Court of Appeal the Master of the Rolls and Lord Justice Kennedy agreed with Mr. Justice Horridge, but Lord Justice Swinfen Eady differed. He thought that the only method which achieved the purpose of the Act was to tax an actual difference between present and past site value. The Lord Chancellor thought, however, that a mere conjecture that Parliament entertained a purpose which, however natural, had not been embodied in the words it had used if they were literally interpreted, was no sufficient reason for departing from the literal interpretation. Indeed, the scheme of the Act appeared to him to provide for all the valuations that from time to time might become necessary. There was no reason to think that the duties of the valuers were confined to the estimation of original values only. In the case of increment value duty, it appeared to him that Parliament must, on the literal construction of its language, be taken to have contemplated the possible taxation of either something more or something less than site value strictly so called. The amount of the duty, whichever construction was adopted, was in the case of increment duty based on deduction from the actual price as the starting-point. For the rest, the ascertainment of the normal market price—i.e., valuation—seemed to him to be prescribed as the basis on which deductions were to be estimated. With the conclusion reached by Mr. Justice Horridge and by the majority in the Court of Appeal he found himself in agreement, and he was of opinion that their judgments ought to be affirmed.

LORD SHAW OF DUNFERMLINE.

Lord Atkinson read a judgment by Lord Shaw in which he agreed with the Lord Chancellor.

LORD MOULTON'S JUDGMENT.

Lord Moulton, dissenting, observed: I cannot think that the learned judges who, in the Court below, supported the contention of the respondents, appreciated the consequences of their interpretation, and how completely inconsistent it was with the object of the Act and its general tenour. To make that plain I will take the figures of the present case, but for the sake of clearness I will suppose that it was a transfer by death, and not by alienation. There is nothing in the Act to make the values for probate purposes the same as those for the taxes on land values, and I will take it that it was the values for probate (instead of the purchasers) who fixed the value of the whole of the owner's interest in the estate at the actual figure of £750 which was the consideration of the sale. How would the matter stand on the contention of the respondents which had been supported by the Courts below? It would stand thus: "The respondents admitted, as they were compelled to do, that the site value had not changed in any way, and that this would be found to be the case whichever valuation one took as correct. But they claimed that the Act entitled them to charge upon the difference of the two values—i.e., of the total estate as being 'increment of site value.' The object and intention of this Act are clear and the point in issue goes to the root of the taxation introduced by it. I cannot bring myself to declare that it has wholly failed to achieve that object or carry out that intent, and, further, that it has done so in a manner so ludicrous as to make it a laughing-stock to any one who will take the trouble to follow out the necessary arithmetical consequences of the construction which is contended for by the respondents. Counsel for the Crown objected to the construction of section 2 by saying that it followed exactly the language there used. That counsel has not even that merit. There is nothing to justify calculating the difference between the £750 of a 'total value' different from the figure from which those deductions are to be made, which is clearly the figure defined in the clause, as representing 'total value.' Indeed, the phrase, 'the like deductions,' not 'the same deductions,' points to all owing to the fact that the circumstances are a charge and that the deductions are to be obtained by like processes mutatis mutandis. This agrees precisely with the

construction put upon the words by the appellant. But there is the far weightier argument against the suggested construction already referred to, and which arises out of the language of the section itself. If it means what is contended for by the Crown, it is not in any sense an "ascertainment" of the "site value" of the land on the occasion. It leads to something wholly different from and independent of the site value—something which may increase when the site value decreases, and vice versa. To shut one's eyes to the expressed object of a clause is a bad preparation for understanding it aright, and between one interpretation which leads to what may rightly and fairly be said to carry out that object, and another which does something irreconcilable therewith, there is no doubt to which preference should be given. If read as a whole, the Act clearly means that for which the appellant contends. The same is true if section 2 be read as a whole. And even if we were to shut out all but a small portion of section 2 and construe it by itself, we could only arrive at the construction contended for by the respondents by forcing the language of the section and ignoring the fact that it is only the "like" deductions, and not the "same" deductions, that are to be made. To calculate deductions on one value of "total value" and then to apply those deductions to another and a different value is not to make the "like" deductions to those made in a process the correctness of which essentially depends on taking one and the same value of "total value" throughout the process. I see, therefore, nothing which requires me to hold that this section bears a meaning which would render misleading its clear and repeated professions that the duty it imposes is a tax on the increment of site value, and I am of opinion that the appellant is right in his construction of the section, and that this appeal should be allowed.

LORD PARMOOR.

Lord Parmoor, in his judgment, concurred entirely with Lord Moulton. He thought that the method adopted by the Referee was accurate. The original site value was £105, so that in this case there was no increment value of land, and no increment value duty was chargeable.—The Lord Chancellor: The appeal stands dismissed, and there will be no order as to costs to either party.

ASSESSMENT OF REVERSION DUTY.—(Commissioners of Inland Revenue v. Marquis Camden).—Judgment was delivered in the House of Lords on Wednesday by Lords Dunsedin, Atkinson, Shaw, and Parkinson, in this appeal from a decision of the Court of Appeal, reversing a decision of Mr. Justice Horridge, in King's Bench Division, with reference to the assessment of reversion duty. The appeal was argued on the 2nd and 3rd inst. In this action the appellants were the Inland Revenue Commissioners, and their appeal was unanimously dismissed, with costs. Under Section 13, Sub-section 1 of the Finance Act, 1909-10, it is enacted that on the determination of a lease the lessor shall pay a duty of 10 per cent. on the difference between the total value of the land at the time the lease was granted and the total value at its determination. Lord Camden let six houses in Camden Town under a building agreement which stipulated that the lessee, Mr. W. H. Wilson, should spend £6,000 in putting the property in order, and in consideration of this the rent was fixed at £125, and a lease for forty years was granted. The question between the parties was whether the £6,000 was a payment made in consideration of the lease under Sub-section 2, Section 13. Mr. Justice Horridge, in the King's Bench Division, confirming the judgment of the Referee, held that it was not. The Court of Appeal unanimously reversed this decision, and the House of Lords now upheld their judgment, and disallowed the appeal of the Crown, with costs.

ENGINEER AS ARBITRATOR.—BANKRUPTCY OF CONTRACTORS.—TRUSTEE'S POWER TO EXAMINE.—(Macdonald, Deakin, and Jones, ex parte the Trustee, July 20, 1914.—Divisional Court in Bankruptcy.—Before Mr. Justice Horridge and Mr. Justice Lush).—This was an appeal by the Trustee in Bankruptcy of Messrs. Macdonald, Deakin, and Jones, against an order of Judge Graham that the engineer, under a contract between the corporation of Burnley and the bankrupt contractors, should not be ordered to be examined by the Trustee, under Section 27 of the Bankruptcy Act, 1883. The section of the Act referred to provided that "Any person known or suspected to have in his possession any of the estate or effects belonging to the debtor, or supposed to be indebted to the debtor, or any person whom it may deem capable of giving information respecting the debtor, his dealings, or property," may be summoned by the Registrar to be examined by the Trustee in Bankruptcy. The Judge of the county-court had refused to make the order for

the examination of the engineer under the contract, on the ground that he could not furnish any facts to the Trustee that were not already known to the contractors, and it was further contended, on behalf of the engineer, that, as he was the arbitrator under the contract, he should not be subjected to such examination. Mr. C. Atkinson, K.C., and Mr. E. J. Rimmer appeared for the appellants, and Mr. Langdon, K.C., and Mr. Hanson for the respondents.—Mr. Atkinson said that the decision of the county-court Judge was clearly wrong, because the object of the section was to enable the Trustee to obtain facts from the witness about which the information given by the bankrupts might be either incorrect or unreliable. He was stopped by the Court.—Mr. Langdon, K.C., said that he could not support the ground of the decision of the county-court Judge, but he urged strongly that as the engineer had under certain matters in relation to the contract an absolute discretion, and as all other matters must be referred to him as arbitrator, his capacity under the contract was purely judicial, and he ought not, therefore, to be called upon to answer questions relating to these matters. The Court allowed the appeal, and ordered that the engineer should attend for examination.—Mr. Justice Horridge said that the grounds of the decision of the county-court Judge were clearly wrong, as otherwise examinations under the section would be abortive. Mr. Langdon had, however, raised a more formidable point, and if he thought that the examination would necessitate the engineer giving a decision upon matters which would afterwards come before him as arbitrator, he would not have made the order. He was, however, not satisfied that there were not matters upon which it was proper that the Trustee should have information which did not require him in answering to anticipate his decision as arbitrator. In this case there had been a forfeiture by the building owners, and the Trustee was entitled to examine the engineer, to find out what had been the course of proceedings since the contractors went off the work. There were, in his opinion, also other matters about which the engineer could give the Trustee information which he was entitled to know. Mr. Justice Lush agreed. Leave to appeal was given.

A CONCRETE-FLOOR COLLAPSE.—The rebuilding of the premises of Messrs. Howes and Son, Ltd., motor-car engineers and bodymakers, of Chapel Field, Norwich, in August and September last year, gave rise to an action and counterclaim heard in the King's Bench Division on Wednesday week before Mr. Justice Bailhache. The action was brought by Messrs. Frank Bradford and Charles David Hunter, trading as Messrs. F. Bradford and Co., London, ferro-concrete builders, against Messrs. Howes and Son, Ltd., for the recovery of a sum of £486 2s. 1d. for work done and material supplied in connection with the putting in of a ferro-concrete floor at the defendants' new works. Mr. Ward appeared for the plaintiffs, and the defendants were represented by Mr. Holman Gregory, K.C., and Mr. Mackinnon. The plaintiffs claim and the amount was paid into court, less £325 6s. 3d., defendants' counterclaim for damages.—Mr. Holman Gregory, K.C., in stating the counterclaim, explained that the defendants, Messrs. Howes and Son, motor-car makers, counterclaimed a sum of £325 6s. 3d. In 1913 Messrs. Howes and Son employed Messrs. Scarles for the rebuilding of their premises. The scheme involved the building of a large first floor with ferro-concrete, and the architect, Mr. Bond, entered into communication with Messrs. Bradford, whose tender for the work was accepted. Defendants commenced the work in June, and finished in September. On September 16 they took away the supports, when the floor began to break up, and they had to do the work over again. They at once admitted that there had been a breach of contract, and set to work to put in a new floor. As a result of this, the premises were not ready for occupation until December 24, and the defendants claimed damages as a result of the delay.—Mr. John Owen Bond, architect for the buildings, said Messrs. Howes had been in their old premises a long time, and purchased the adjoining house and commenced rebuilding. This floor was 4,330 ft. square, and was in the front of the premises. He saw Mr. Hunter previous to the contract, and explained to him the necessity of the work being finished speedily, because temporary premises would have to be taken. The suggestion was made that the floor should be completed a third at a time, so that the men would get to work on it, but plaintiffs said this was not possible. On August 24 one of the concrete beams which the plaintiffs had put in began to crumble and fall. The plaintiffs put it right, and the work was finished on September 9. On the 16th the men came to take away the supports, and then the whole floor began to

collapse. He had, as a result, to put in supports to keep the front of the building in position. The result of this was that the defendants had to continue in their temporary premises. When he discussed the question of the failure of the floor with Mr. Bradford, he said it did not matter if it cost £1,000 to remedy, as he should claim against the cement-makers. In his opinion, defendants' charges in the counterclaim were reasonable.—Cross-examined, witness said he was superintending the execution of the work, but had nothing to do with the mixing of the cement for the concrete. Messrs. Bradford ought to have tested the cement. The cause of the failure of the floor was the character of the cement. There was no extension of time given to Mr. Scarles, the builder, except in the case of odd works delayed in consequence of the failure of the floor.—Mr. Stanley Howes, managing director of the defendants' firm, said the counterclaim related to loss owing to the continued occupancy of temporary premises, which resulted in want of supervision, loss of time, and consumption of more stores.—Mr. William Thomas Scarles, builder, of Norwich, said his firm, Scarles Brothers, did the building work at competitive prices. The work was delayed, and extras had to be done in consequence of the floor. As to the estimate for repair of the concrete, he should more than double it, and thought a mistake had been made in this respect.—Mr. Frank Bradford, of the plaintiff firm, giving evidence in rebuttal of the counterclaim, said the failure was due to failure of the cement. When his firm discovered what had happened they used every expedition to get the work done again.—Cross-examined, witness said his firm had a guarantee with the cement.—Plaintiffs' foreman gave evidence to the effect that the work was properly done by the workmen.—Mr. Ward submitted that as there was no time limit in the contract the plaintiffs must be allowed reasonable time in which to execute the work. The failure due to the cement was not the fault of plaintiffs, and therefore they had executed their contract within a reasonable time.—His Lordship said the plaintiffs had failed in their construction of the first floor and must pay damages. Where the contract did not specify a time the plaintiff must have reasonable time allowed for the execution of the work under existing ordinary circumstances. Messrs. Bradford had constructed the first floor within three months, and that indicated that this period of time was a reasonable one in which to fulfil their contract. Mr. Ward had argued that this work was spoiled by the bad cement, and that that ought to be taken into account to get a further extension of time, but his Lordship did not think that that was a circumstance to be taken into account. They had reasonable time allowed, and by the terms of their contract should have used proper cement. It was not neglect on plaintiffs' part that this cement was used, but it was no answer to a breach of contract, and the law did not allow a man to plead his own breach of contract as a reason for the extension of time for the performance of that contract. The only question remaining was that of damages, and these must be reduced by £10. There would be judgment for the plaintiffs for £486 2s. 1d., and judgment for the defendants on the counterclaim for £315 6s. The plaintiffs would have costs of the action, and the defendants costs of the counterclaim.

APPEALS TO THE LOCAL GOVERNMENT BOARD.—In the House of Lords, on Monday, the Lord Chancellor and Lords Shaw, Moulton, and Parmoor gave a considered judgment in the appeal by the Local Government Board against an order of the Court of Appeal involving questions of the Board's procedure and the secrecy of their inspectors' reports. An inspector of the appellants made a closing order against Mr. Arlidge in respect of some small house property of his at Hampstead. He appealed to the Local Government Board, and his appeal was dismissed. Mr. Arlidge maintained that the Board, contrary to the rules of evidence, and contrary to natural justice, received and took into consideration evidence, documents, and statements which were not disclosed to him, and without giving him an opportunity of contradicting or commenting upon them. The Local Government Board submitted that their procedure was sanctioned by the Housing of the Working Classes Acts, and that their practice to treat as confidential documents reports made to them by their inspectors at local inquiries was reasonable, and was a well-known and established practice. Their Lordships allowed the appeal of the Local Government Board with costs, and restored the order of the Divisional Court.

INDEPENDENT CLAIMS UNDER WORKMEN'S COMPENSATION ACT.—Coaling v. John Mowlem and Co., Ltd.—In the Court of Appeal on Tuesday Lords Justices Buckley, Kennedy, and Phillimore delivered judgment in this action, an appeal from a judgment by Mr.

Justice Atkin, involving a question of law. The widow of one William Codrlog, who was killed while working for a well-known firm of contractors, began proceedings in the City of London Court, claiming damages under Lord Campbell's Act on behalf of herself and her six children. The employers denied that the workman met with his death from any negligence on their part, and paid £300 into court as the maximum which could be claimed as compensation under the Workmen's Compensation Act. The six children applied for payment out of the £300 in court, stating that their mother did not propose to claim under the Workmen's Compensation Act. At the hearing the widow renounced all her rights to any share in the £300, and an award was made with her consent that the money should be paid out for the benefit of the six children only. The widow afterwards proceeded with her action for damages against the employers. The point raised was whether the widow's action was not barred under section 1, subsection 2 (b) of the Workmen's Compensation Act of 1906. Mr. Justice Atkin held that the action was, under that statute, not maintainable, and the widow's appeal was now unanimously dismissed by the Court of Appeal, counsel for defendants not being called upon.

AN ORFORDNESS ARBITRATION AWARD.—The Hon. E. G. Strutt, the arbitrator in the claim brought by Lord Rendlesham against the War Office for compensation for 1,249 acres of land at King's Marshes, Orfordness, East Suffolk, required for aviation purposes, published his award on Tuesday, the amount being £12,107, in addition to £1,000 as compensation to tenants. At the arbitration proceedings the expert witnesses called on behalf of the claimant, Mr. H. Trustram Eve and Mr. W. A. Simmons, valued the land for aviation purposes at £25 an acre, or £33,620 15s., after 10 per cent. had been added for compulsory acquisition and an agreed amount for outgoings deducted. On behalf of the War Office, the land was valued by Brigadier-General D. Henderson at £6,689.

Mr. P. Glover has resigned his appointment as surveyor to the county of Kildare.

Mr. A. E. Smith, late of Uxbridge, has been appointed surveyor and inspector of nuisances at Petersfield.

It is proposed to erect forthwith a large Patents Syndicate. Messrs. J. A. J. Woodward and Sons are the architects.

After a long discussion, the town council of Bromley, Kent, have adjourned the consideration of a proposal to appoint a special committee to consider the desirability of erecting a public hall in Bromley.

The death of Mr. William Harry White, formerly chief engineer and secretary to the Government of Bombay Public Works Department, is announced. Mr. White joined the service in 1873, became superintending engineer in 1900, and was appointed an additional Member of the Legislative Council in 1904. He retired in 1907, when he was created a Companion of the Order of the Star of India.

Mr. R. H. Birknell, Local Government Board inspector, held an inquiry at the town-hall, Maidstone, on Monday, respecting the application of the corporation for sanction to borrow £1,050 for the purchase of land in Upper Fant-road and Tonbridge-road, for the purposes of street improvement, a recreation-ground, and the erection of artisans' dwellings; and also for power to borrow £3,810 for the erection of an Agricultural Hall in the Lock Meadow.

A Royal Commission has been appointed to report on the condition of the double avenue of elms, nearly three miles in length, in the Long Walk, Windsor Great Park. The trees, which at one time numbered 1,632, were first planted in 1680, an operation completed by William III. During recent years many of the elms have either fallen or been cut down, and some of those still standing show signs of decay. The Commission consists of Prince Christian, chairman; Lord Redesdale, Sir Stafford Howard, Sir William Schlich, Sir David Prin, with Mr. A. J. Forrest (Crown Receiver) as secretary.

At Friday's meeting of the Birmingham Education Committee, the chairman, Sir George Kenrick, reminded the members that at their previous meeting a member suggested they should inquire into circumstances affecting two of their contractors. Inquiry was made, and it was found they had not complied with the resolution of the city council. Therefore, their tenders were put on one side, and the next lowest was recommended. Although these gentlemen had signed the conditions of contract in which they agreed only to employ labour at the proper rates of remuneration, they frankly admitted they had signed without reading the terms. The report was approved and adopted.

PARLIAMENTARY NOTES.

MALL APPROACH IMPROVEMENT.—In debate on the Mall Approach Improvement (Expenses) resolution on Monday, Mr. Handel Booth objected to the provinces being called upon to pay a share of this money. London ought to be ashamed to ask for assistance. Mr. Hodge objected to Scottish money being used for the purpose of beautifying London. An amendment, moved by Sir F. Bambery, to limit the amount of assistance from Imperial funds to £38,000, was rejected by 129 votes to 30. The resolution was then agreed to.

THE NEW WESTERN ROAD.—In the House of Lords on Monday, on the motion for the third reading of the Middlesex County Council (Western Road and Improvements and Finance) Bill, Lord Montagu of Beaulieu moved the omission of the clause authorising the Middlesex County Council to make a charge of 3d. a mile on each motor omnibus using the new road. He protested against a tax on this class of vehicle, while heavy motor trolleys and traction-engines were to go free. Several speakers, including Lord Strachie (who gave the views of the Local Government Board), thought the clause was justified in this particular case. The amendment was not pressed to a division, and the Bill was read a third time and passed. The measure has now passed through all stages in both Houses, and only awaits the Royal assent.

SMOKE ABATEMENT.—Mr. Budden, manager of Doulton's Pottery Works, Lambeth, gave evidence on Wednesday before the Smoke Abatement Committee. He stated that two or three years ago the question was raised in the House of Commons whether the fabrics of Westminster Abbey and Lambeth Palace were not disfigured by the products of the chimneys of Messrs. Doulton's works. Careful investigation was made, and it was found that the sides of the abbey and of the palace which directly faced the Doulton potteries were in a better state of preservation than the other sides. Manufacturers had every inducement to mitigate the smoke nuisance, because they desired to utilise their fuel and not waste it. Witness considered there should be financial aid forthcoming from the Government to assist manufacturers in the carrying out of costly experiments. Such experiments would involve an outlay so enormous that it would be almost impossible for a pottery manufacturer, or even a combination of pottery manufacturers, to carry them out. Mr. Budden suggested the appointment of a permanent advisory committee to consider the merits of the cases investigated by smoke inspectors before proceedings were instituted against manufacturers.

Considerable alterations and additions have just been completed at Congham Lodge, Norfolk, for Sir Everard Folke, Bart., entailing an outlay of about £4,000. Mr. Herbert J. Green, of Norwich, has acted as architect, and the work has been carried out by Messrs. Dye and Allen, of King's Lynn.

The 67th annual general meeting of the Builders' Benevolent Institution was held on Wednesday afternoon at Koh-i-Noor House, Kingsway, Mr. G. R. Holland (Messrs. W. Cubitt and Co.) presiding, when Mr. Holland was elected president, and Mr. Frank May re-elected treasurer.

Bertie Frank Parker, forty-two, clerk, of Newlands-terrace, Battersea, was found guilty at the Marylebone Police-court on Wednesday of stealing £54 belonging to his employer, Mr. Edward John Saunders, builder, of Eleon-street, Westbourne Park. Prisoner had to collect each week the men's and the employer's contribution for unemployment and health insurance, but the prosecutor, at the end of the half-year, discovered that the cards had not been stamped to the extent of £54.—The prisoner was sentenced to two months' hard labour.

At the county schools at Tilbury, Mr. Courtenay Clifton, an inspector under the Local Government Board, has held an inquiry into the application of the urban district council for sanction to borrow £61,225 for the purchase of land and the erection of working-class dwellings: £2,275 for the purchase of land in the north and south wards, under the Housing and Town-Planning Act; £3,535 for works of surface-water drainage and channelling; and £6,138 for the purchase of land in the south ward for a depot, allotments, and public walks and pleasure-grounds. Mr. Petter, the architect, explained the housing scheme, and said the 234 houses would be in three classes. In Class I, 12 would be let at 7s., and 18 at 7s. 3d.; Class II, 64 at 7s. 3d., and 16 at 9s. 6d.; Class III, 104 at 5s. 3d. Further evidence in support was given by Dr. J. C. Thresh, medical officer for the county, and Dr. Fowler, medical officer for the urban district.

Our Office Table.

Complaints about the manner in which some Lancashire and Cheshire authorities repair their roads were made at a meeting on Tuesday of the Lancashire and Cheshire branch of the Roads Improvement Association, in the Midland Hotel, Manchester. It was stated that instead of tarring half of a roadway with sand or chippings, some authorities tarred complete sections at the same time, leaving the tar uncovered, with the result that it took cyclists and motorists longer to clean their machines and vehicles than it did for them to do even lengthy journeys. One member stated that last year he saw tar running down the grids at Chesterfield, and that the same thing happened this year at Disley. In view of these occurrences the secretary was instructed to write to the borough surveyor of Preston requesting that in future only one-half of the roadway should be tarred at a time.

The United States army engineers have long used the following mixture in waterproofing cement: One part cement, two parts sand, three-quarters pound of dry powdered alum to each cubic foot of sand. Mix dry and add water in which has been dissolved three-quarters of a pound of soap to each gallon. This is nearly as strong as ordinary cement, and is quite impervious to water, besides preventing efflorescence. For a wash, a mixture of one pound of lye and two pounds of alum in two gallons of water is often used.

A report issued by the Austrian Society of Engineers and Architects gives the results of an investigation conducted by the committee on reinforced concrete appointed by the Society. Facts, rather than theories, were kept in view throughout. Thus, the results obtained, which may some day lead to the evolution of a theory, serve in the meantime to establish facts of much value to practical constructors. The degree of fixity to be allowed for in the expression of the bending moment and in the design of reinforcement for resistance to negative bending moments is one of the most delicate questions for consideration by the designer. While the ends of reinforced-concrete beams, as usually applied, are not supported freely, the condition of perfect fixity is rarely attained. Therefore the observations made relative to the extent to which the ends are fixed under various practical conditions are of high interest. One of the most remarkable points brought out in the course of the investigation is the fact that the resistance of beams stiffened by gussets or knee-braces at the ends is seven times greater than that of beams uniform in cross-section throughout.

An engineer has described in a paper read before the American Society for Testing Materials his experiments to measure the compressive, tensile, shearing, and transverse strengths of lime mortar, and to ascertain how these values are affected by the more numerous variables met with in practice, such as chemical composition of the lime, kind and amount of sand, size and shape of test specimen, conditions under which the test specimen is stored, and the effect of added materials. The results are very disappointing, for they demonstrate that the strength developed by a specimen of lime mortar is affected by too many variables to be capable of accurate measurement in the laboratory, and that even if this were possible, there is no assurance that the results obtained would be comparable with those which might be expected in practice.

MEETINGS FOR THE ENSUING WEEK.

WEDNESDAY.—National Federation of Builders' Trades Employers. Semi-annual Meeting at the South Wales Institute of Engineers, Park-place, Cardiff. 10.30 a.m.

The Hertfordshire County Council decided on Monday to purchase from the East Garden City, Limited, 86 acres of land on the fringe of the Letchworth estate for £5,000, as a site for a sanatorium and hospital for the treatment of tuberculosis.

TRADE NOTES.

Boyle's latest patent "Air-Pump" Ventilator has been applied to the Workmen's Hall and Institute, Blaengwni (Glam.).

We understand that the cement work in connection with the office extension of the Tramways Dept., Glasgow Corporation, is being treated with the powder Pullo, which makes cement waterproof.

Mr. J. Craddock Perkin, F.R.I.B.A., formerly of "Graham House," 3, Tudor-street, E.C., has now removed his office to "Bridge House," 181, Queen Victoria-street, E.C., close to Blackfriars Station. Telephone 2420 Central.

Claridge's Patent Asphalte Co., Ltd., announce that they have opened an agency in Manchester to cope with the work in the North Midlands District. Their representative is Mr. E. J. Thompson, of 36, Spring-chambers, Manchester.

Messrs. John W. Simpson, F.R.I.B.A., and Maxwell Ayrton, A.R.I.B.A., 3, Verulam-buildings, Gray's-inn, London, W.C., inform us that, in accordance with their usual practice, their offices will be closed from August 3 to 17, both days inclusive, for the annual staff holidays. Arrangements will be made as usual for dealing with all business referring to buildings in actual progress.

Mr. W. J. Hiseox, of Marlborough, has been appointed surveyor and inspector of nuisances to the Hay Urban District Council.

A new diocesan college is being built at Ballaghaderreen from plans by Messrs. W. H. Byrne and Son, of Dublin. The contractor is Mr. James Kiernan.

At Halifax, N.S., the erection of a science building for Dalhousie University is well advanced, and it is hoped to have the building completed by September. The total estimated cost of the work is £50,000. The architect is Mr. A. R. Cobb, and the general contractors are Messrs. Falconer and McDonald, Halifax.

A Local Government Board inquiry was held at the town-hall Wallasey, yesterday (Thursday), in regard to the corporation's application to borrow £1,570 for the widening of the north-east side of Breck-road, adjoining the Wirral Railway; £2,075 for the widening of Claremont-road, south of Mayfield-road; and £997 for the provision of a public footpath from Warren-drive to Sea-road, affording a short cut to the municipal golf-links and the shore.

The committee of the Capetown Cathedral Memorial Fund, which was formed in 1901 for the purpose of building the east end of the cathedral at Capetown, as a memorial for those who died, and a thank-offering for those who were spared in the war in South Africa, has almost finished the work entrusted to it. The architects are Messrs. Herbert Baker and Massey, whose design was illustrated by a ground plan and perspective in the BUILDING NEWS for February 21, 1902.

The first section of the new buildings which are being erected for Cheshunt College at Cambridge is approaching completion, and the opening ceremony has been fixed for October. The cost of the work now in hand is about £20,000. The site is near the Botanical Gardens in Bateman-street, near Trumpington-street. Mr. P. Morley Horder, F.R.I.B.A., is the architect, and his design, selected in competition by Sir Aston Webb, was illustrated by a birds-eye view in our issue of June 6, 1913.

------------------------------------------------------------------	------------

TO CORRESPONDENTS.

We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.

It is particularly requested that all drawings and all communications respecting illustrations or literary matter, books for review, etc., should be addressed to the EDITOR of the BUILDING NEWS, Effingham House, 1, Arundel-street, Strand, W.C., and not to members of the staff by name. Delay is not infrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

* Drawings of selected competition designs, important public and private buildings, details of old and new work, and good sketches are always welcome, and for such no charge is made for insertion. Of mere commonplace subjects—small churches, chapels, houses, etc.—we have usually far more sent than we can insert, but are glad to do so when space permits, on mutually advantageous terms, which may be ascertained on application.

When favouring us with drawings or photographs, architects are asked kindly to state how long the building has been erected. It does neither them nor us much good to illustrate buildings which have been some time executed, except under special circumstances.

NOTICE.

Bound copies of Vol. CV. are now ready, and should be ordered early (price 12s. each, by post 12s. 9d.), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLVI., XLIX., LIII., LXI., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXXI., LXXII., LXXIII., LXXIV., LXXV., LXXVI., LXXVII., LXXVIII., LXXX., LXXXI., LXXXII., LXXXIII., LXXXIV., LXXXV., LXXXVI., LXXXVII., LXXXVIII., LXXXIX., XC., XCI., XCII., XCIII., XCIV., XCV., XCVI., XCVII., XCVIII., XCIX., C., CI., CII., CIII., CIV., and CV. may still be obtained at the same price; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 6d. (or 33fr. 30c.). To India, £1 6s. 6d. To any of the Australasian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 6d.

* Our Direct Subscription Agents for Australia are Messrs. E. T. Kibblewhite and Co., Printers and Publishers, 19, York Chambers, 105, Liverpool-street, Sydney, New South Wales; for Japan, Messrs. Z. F. Maruya and Co., Ltd., 11-16, Niobashi Tori Sancho-me, Tokyo; who will receive Subscriptions at £1 6s. per annum on our account. Copies of the paper will be sent by us direct to the subscribers' addresses.

* The special rate to Canada is £1 1s. 8d. = 5dols. 27c. for 12 months, and 10s. 10d. = 2dols. 64c. for six months. Our Direct Subscription Agents for Canada are Messrs. Sells, Ltd., 302, Shaftesbury Buildings, McGill-street, Montreal, who will receive Subscriptions, £1 1s. 8d. per annum, on our account.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED, and crossed London County and Westminster Bank.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation Advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 60 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

SITUATIONS VACANT AND PARTNERSHIPS.

The charge for advertisements for "Situations Vacant" and "Partnerships" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

SITUATIONS WANTED.

Advertisements not exceeding Thirty Words, inclusive of name and address, are inserted under the heading "Situations Wanted," free of charge.

Rates for Trade Advertisements on front page, and special and other positions, can be obtained on application to the Publisher.

* Replies to advertisements can be received at the Office, Effingham House, 1, Arundel-street, Strand, W.C., free of charge. If to be forwarded under cover to advertiser, an extra charge of Sixpence is made. (See Notice at head of "Situations.")

RECEIVED.—L. and Co.—G. J. and Son, Ltd.—W. H. S. and Son.—A. P. C. M., Ltd.—D. T. A.—J. J.—J. K. and Son, Ltd.—Sir W. H. B. and Co., Ltd.—E. N. and Co.—M. R. E.—P. and Co.—S. P. and Co., Ltd.—B. U. D. C.—Z. P. M. and Co.—F. B. and B.—B. of H.—T. T. R.—P. B. and P.—D. T. and F.—H. H. and Co., Ltd.—W. H. H.—G. and Son.—F. K. M. C.

SALOPIAN.—Yes.
R. T. F.—Thanks, no.
BURMAN.—Kindly send.
ERIC E. EVANS.—Sorry, but we really do not know what you mean by an "uncomplicated roof truss."
N. W.—Any of the firms listed in our Directory under "Structural Iron and Steel Work," will do all you want.

PLASTER.—We know nothing of the firm Bellman, Ivey, and Carter, Ltd., Linhope-street, are the recognised specialists in Scagliola marble.
B. E. LAINE-PEARSON.—The statement on p. 64 last week, that there were 185 cubic feet in a St. Petersburg standard, was a slip. It should, of course, have been 165ft. We thank you for pointing it out. We fail to find any errors in the prices you refer to, after comparison with current sales, as reported in the principal timber trades journal.
J. C. OXFEN.—(The last subject for the Session 1913-11, is that illustrated to-day for a small crematorium. The awards of the prizes for the three best series of designs submitted during the year will be published early in October, when the new session will commence. Names of intending members may be sent in meanwhile, and copies of the rules can be had, post free, on application to the Editor.)

LIST OF COMPETITIONS OPEN.

July 21—Cottages, Chapel-en-le-Frith	10gs., 5gs., 2gs.	The Clerk, Rural District Council, Chapel-en-le-Frith Stockport.
.. 25—Designs for Police and Fire Station, Redhill. (Assessor)	40gs., 20gs., 10gs.	A. Smith, Town Clerk, Municipal Buildings, Reigate.
Sept. 7—Designs for Public Elementary Schools at Lindal-street, York-road, Battersea; and Billinggate-street, Church-street, Greenwich. (Mr. J. W. Simpson, F.R.I.B.A., Assessor)		L. Gomme, Clerk, Education Offices, Victoria Embk., W.C.
.. 15—Designs for Shakespeare Memorial National Theatre (Mr. T. E. Colcutt, P.P.R.I.B.A., Assessor)	500gs. (merged), and five of 150gs.	The Secretary, 3A, Dean's-yard, Westminster Abbey, S.W.
Oct. 31—Laying Out Show Grounds, Wayville West, Adelaide	£500, £200, £100	The Secretary, Royal Agricultural Society of South Australia, 23, Waymouth-street, Adelaide.
.. 31—Drawings for Police Buildings and Fire Station, St. Helens. (Assessor)	£100, £50, £25.	A. W. Bradley, M.J.C.E., Town Hall, St. Helens.
Dec. 31—Planning Workmen's Settlement, Campine Coalfield	£400, £240	M. le President de la Commission pour l'Aménagement des Agglomérations Industrielles, Rue de Louvain, Brussels.
No date—Drawing or Photograph of English or Continental Metal Work	5gs., 3gs., 2gs.	Whitehead and Caslake, Ltd., The Broadway, Hendon, N.W.
do. —Designs for Technical Schools and Education Offices (Mr. Paul Waterhouse, F.R.I.B.A., Assessor)		J. E. Jarratt, Town Clerk, Town Hall, Southampton.
do. —Plans for 20 Houses (Costing from £200 to £270), Gildersome		W. Wilby, Sur., Council Offices, Gildersome.

HOW THE BLIND LEAD THE BLIND.

It is singular that although much attention has been given to education during the past quarter of a century, few, if any, of our master builders know anything of the scientific basis underlying their work. It is difficult to understand what occupied their time at the high schools or technical schools they attended, for it was certainly not anything having the most remote connection with even as much applied chemistry, geology, or botany as concerns their business, about all of which subjects they are deplorably ignorant. It may be asked what value would such be to a bricklayer who can build straight? He would, at any rate, know good lime from bad, and a good brick from one that would not stand the weather; although we possibly admit we should prefer to employ the man who could carry out his courses level and his quoins plumb to one who could do neither, but was able to tell us how the magnesia got into the dolomites of the Permian rocks. We need not be surprised that the scholars should know so little when the teachers are so woefully ignorant of subjects they profess to instruct them in. Take this as a sample: "The knowledge of the mineralogical components of a stone helps us to ascertain its weather-resisting qualities," says one of the teachers, which is true. Now for the application of this fact. "Very harmful additions are principally carbonate of lime . . . the most desirable are consequently the most silicious stones." There are two statements here absolutely misleading, and they could only have been made by one having no practical knowledge whatever of his subject. Whether carbonate of lime is harmful or not depends entirely on its condition. It may be earthy, as in chalk, when it is "harmful"; but it may be highly crystalline, as in some of the Carboniferous limestones, in which case as a building-stone it is indestructible. The most silicious stones are not the most desirable, for many of them decay rapidly: witness the Old Red sandstone of Herefordshire and the New Red of Cheshire. As a sandstone is built up with grains of silica, felspar, and mica, its value as a building-stone will depend on the cement which binds the grains together, and it is not conceivable that our authority meant by silicious stones those like flint, which are the most silicious stones found in nature, but which are unworkable, except in plain walling and in small sizes.

Take another authority, this time on timber. He says: "For framing the best deals to be depended on are the Norway, particularly the Christiania battens."

Now, a Christiania batten has not been known in the timber market for fifty years, and our authority has a suspicion of something of the kind, for he goes on to say, "These deals are now very scarce, and, indeed, are almost unattainable." Another up-to-date authority says that "we import but very little wood from the United States, with the exception of staves," although he goes on to say that pitch-pine has long been in general use for building, and is imported from St. Mary's, Pensacola, Georgia, etc. If these places are not in the United States, where are they? There are two dangerous men at present engaged in teaching the principles of building construction—the University man who has no practical knowledge of the work, and the practical man who has practical knowledge of a sort, but is wholly ignorant of its underlying elements. How many workmen, or even builders, know what lime, the commonest material they use, is? That in every hundredweight of pure lime there must be eighty pounds of a yellow metal known to chemists as calcium, and thirty-two pounds of oxygen gas, and nothing else, is a statement that would be received with incredulity. Yet it is a fact, and on this metallic base all our limes and cements are built up. Taking our best known limes—chalk, stone, magnesium, lias, and Roman cement—all having different properties; what do they really consist of? Chiefly lime. White chalk burns to a white lime, which is wholly soluble in hydrochloric acid, and it is used chiefly for plastering in London; it never "sets," and in damp places, like foundations, it remains soft. As a matter of fact, mortar made with it only hardens by drying.

In the cements which "set," this means that in them certain new chemical combinations are formed in presence of water, and these become hard; but it is obvious that in chalk lime there are no substances present to form any such new compounds, and the process of taking up carbonic acid from the air is such a slow one that the builder would be a hundred years at least in his grave before it helped his work in any way. Lime, then, is the basis of all building mortars, and of cements, natural and artificial; and the architect should always recollect that it may be pure or combined with other substances, and if a knowledge of this fact is of importance in the selection of his materials, he should specify it without any ambiguity. To make our meaning clear, it will not do to mention "chalk lime" in a contract, for the Upper Chalk of geologists yields white lime, which is wholly soluble in water, and

the Lower Chalk a grey lime, such as that found at Merstham and Dorking. A strange thing about lime is that so many rocks, and so diverse in physical character, should yield it in a nearly pure condition. Many of the Carboniferous Limestones of the North of England and the Great Central plain of Ireland are pure limestone, the discolouring matter being carbon, which passes off as carbonic acid in the kiln. This is how it is that the black marble of Kilkenny burns to a pure white lime. Again, limestone is found varying much in specific gravity: in chalk it may weigh 126lb. to the cubic foot, and in mountain limestone over 171lb. The appearance of these stones is totally different, yet chemically they are identical, consisting only of lime and carbonic acid. Lime is always found in combination with some other substance, and the carbonate is used to obtain it, for the carbon passes away readily in the kiln at a moderate temperature. The lime could not be obtained so cheaply in any other way.

But where did the metal calcium—which is, as we have said, the basis of lime—come from? The crystalline rocks are the only known source of lime, and it must have been suspended in an invisible form in the seas before it was thrown down as limestone. By the crystalline rocks we mean granite, basalt, and other fire-formed rocks, whether plutonic or volcanic. This limestone is soluble in water at 60deg. F.; 100 parts of water will take up 1368 parts of calcium carbonate, and at boiling-point (212deg. F.) it will take up only one-half the quantity; and this is why pipes in hot-water-circulating apparatus become furred, for the limestone is thrown down gradually as the temperature of the water in the pipes is raised, the hot water not being able to hold it in solution. When clay is present in limestone, it is in a finely-divided state, and is distributed throughout the mass of the rock. Now, as any lime will for its constituents depend entirely on the stone from which it is burned, it follows that a clayey limestone will yield a clayey lime, the clay being indestructible in the fire when its heat is not high enough to bring about its combination with the lime as calcium silicate and calcium aluminate. The presence of clay with the lime renders the latter more soluble in water. Hence the Lias lime will set under water when pure lime will not do so. From this it would appear to be a necessity that when Portland cement is not used for pointing the walls of houses exposed to driving rains, his lime should be, for it will set and harden under these conditions, and pure lime will not.

Smeaton knew, when he was building the Eddystone lighthouse, that clay was a valuable ingredient in lime for his purpose, and he used lias from Aberthaw, in South Wales. But his knowledge died out with him so far as the majority of our building workmen or their employers are concerned. When a definite quantity of water is thrown on lime, it is absorbed, and the lime-lumps fall to a dry powder, all the water having disappeared. But the action of pure lime and lias lime under this cold-water treatment differs considerably. When water is thrown on pure lime it swells in bulk considerably, it becomes intensely hot, and, if left uncovered, it disengages steam with great violence; it is of the utmost importance that the workman should know, if he does not throw on enough water at once to satisfy the combining properties of the lime it will not slake to a fine powder: the result will be a mass of fine spheres, like small shot, of small value for mortar-making.

Few workmen appear to have any idea of what takes place when lime is slaked, and they never remark on the strange fact that the water they throw on it completely disappears, and the lime is as dry as if it had not been subjected to this treatment. The water added to the lime in this way may be driven off by heat, and the same lime may be slaked and unslaked at pleasure. It is important to note that the pure limes are more easily slaked than those containing clay: hence the latter are generally sent out in sacks, ground, to be slaked, while the only chance of being able to send the pure limes any distance is to slake them before they are sent on their journey. This traffic in slaked pure lime is common in the United States; but it would be dangerous to add water to any lime containing clay, with a view to slaking it for transport, as it would probably "set," and therefore be of no value at the end of its journey. Magnesium limestone has for its basis magnesium, and not calcium; it is burned for lime wherever that stone outcrops, and though it is claimed for it that the lime is hydraulic, this claim has never been substantiated. Another source of natural cement is the Septaria found in nearly all clays; these may be seen on the beach at Sheppey and in the clay cliffs along this coast and on the opposite side of the Thames. They are called Septaria from the partitions, or septa, by which they are divided, and are a mixture of lime and clay formed in a sea where lime was thrown down with clay; but the former in too small a quantity to form a continuous limestone deposit. These Septaria, calcined and ground, make our so-called "Roman" cement, the distinguishing characteristic of which is its property of setting rapidly, even under water. A Derbyshire firm, "the largest manufacturers of lime in the world," say that their lime has no equal for plastering, and they give its analysis: Lime 98.20, magnesia 0.25, oxide of iron and alumina 6.20, silica 0.25, moisture and inorganic matter 1.10. It will be seen that this is practically a pure lime, and exactly similar to that obtained from white chalk, and the crystalline carboniferous limestone of Ireland.

Turn to timber, and see what experts have to say about that. The wood for carpenters' work, we are told, comes from Memel, Riga, Dantzic, and Sweden; that for joinery from Christiania, Stockholm, Gelle, On-ga, and other Northern ports. If by carpenters' work is meant the floor-joists and rafters of the houses going up all over London, then there is little or no Memel, Riga, or Dantzic timber used in them. The builder gets his 9in. by 3in., 7in. by 2in., or 4in.

by 2in. from the timber merchant, without a thought of what port it comes from, so long as it is cheap. As we have said before, we get no deals fit for joinery from Christiania, and the speculating builder will not trouble to get White Sea deals for his joinery when he can get much cheaper

to design his buildings so that unseasoned timber may be used in them. This is building construction turned topsy-turvy with a vengeance. Many doors of Swedish manufacture are imported at present, some elaborately panelled, and some with circular work. We give an illustration of

stuff from any port in the Gulf of Finland. An extraordinary piece of advice given is to select timber 12in. square, this being the most convenient size. We have converted many logs, and, with a keen eye to have as little sapwood as possible: we selected Crown Memel logs 2ft. square, and we found the larger the log the better the scantlings cut from it. In all these pines there is about 3in. of sapwood; it follows, therefore, that there will be less of this waste wood in proportion in a large log than in a small one. We are advised to avoid in timber spongy hearts, porous grain, and dead knots. Unfortunately, these defects cannot be seen until the log is opened, and then it is too late; the purchaser must put up with the loss, as the timber merchant does not hold himself responsible for such failures, even though he selected the log, and the only way the builder can protect himself in the matter is to make a "special" arrangement to get sound wood, paying an extra penny or two-pence a foot for it. In other words, let the builder contract himself out of "the custom of the trade" by making a special agreement, as we have suggested.

We will, for the present, close our extracts from expert advice with the following: "As it is vain to attempt to buy dry whole timber, it is necessary, in designing a building, to so arrange the timber that any shrinkage shall not affect the structural stability of the work." The architect always specifies that his timber is to be well seasoned; but here he is asked

a Georgian door, and none of these Swedish productions equal it in appearance and stability, although it is what was known a hundred years ago as a batten door—that is, one in which the panels are nailed on a plain surface specially made to take them. Why cannot builders copy this?

NATIONAL COMPETITIONS AND ROYAL COLLEGE OF ART EXHIBITIONS, 1914.

This week these two annual exhibitions have been opened at South Kensington. The larger is on view in the "North Court" of the Victoria and Albert Museum, where the assemblage will be open to public inspection till the end of August. The architectural achievements from all parts of the country are pretty much on a level with the productions of past years in this class, under the auspices of the Board of Education. Notwithstanding the pontifical ambiguities of the Examiners in their report, little change either for better or worse can be recorded this year, and, while we entirely agree that the examples chosen for display on this occasion rank at a pretty low level, we question the official assurance heading the architects' report, that "the average level of work submitted is scarcely up to that of previous years."* As a matter

* Herbert Spencer expressed in the fewest words why every exhibition at the R.A. is spoken of as "below the average." "Those who regularly visit these exhibitions presumably cultivate their taste, and apply the test of a

of fact, this question of average has long enough resolved itself into a persistent demonstration of the ineptitude of the whole system. The changes and reforms about which so much was said two or three years ago do not appear to have brought about any improvement. Indeed, the judges—Mr. Reginald Blomfield, R.A., Professor E. S. Prior, A.R.A., and Mr. Charles F. A. Voysey—call attention to the continued want of thought shown in planning and construction. A paragraph or two, intended to show the way of escape, are added, admonishing teachers not to permit students to introduce "features the logical intention and construction of which they do not understand." Tricks of skiagraphy are, perhaps, less in evidence this year, though a vulgar and meaningless use of colour prevails still in various quarters. Only one bronze medal, anyhow, has been awarded for architectural design, and we can but once again urge the need of the abandonment of trying to teach architecture in such a futile fashion.

There are fewer drawings shown this year which have done duty previously in the Institute Students' Competitions and elsewhere, but we seem to remember some old friends still. Mr. Thomas Stott, of Manchester, who takes the sole bronze medal in this class, wins it with a Late Classic brick and stone-dressed design for an Industrial Arts Museum, set up with attenuated detail. The report describes it as "a quiet and well-considered" scheme. A minority report as to this would not have surprised us; but "circumstances alter cases." Mr. Sidney H. Head, of Lambeth, obtains a book prize for a design for a Park Bridge in stone, headed by a monumental archway, designated "Gloucester Gate," and not badly detailed. Mr. William O. Jones, of Manchester, receives similar recognition for a Domed Votive Church (513), chiefly remarkable for a very lofty cupola and square plan with an apsidal sanctuary and apses to the transepts, also a portico on the west front. Commendations were extended to Mr. James Greenwood, of Lambeth, for his commonsense Georgian Country House (1313) in red brick and stone; but the plans are most indifferent, and the sheet of sections has an empty look, evincing a lack of care in spacing out, both in drawing and design. We have not much to say about the College Quadrangle (1460), by Mr. Reginald S. Moore. Mr. Thomas Fenbow, of Newcastle, is likewise commended by the examiners for a Mausoleum design with a "pepper-box" sort of top, surmounted by a gilded roof well reflected in the ornamental water in front, suggesting the commonplaces of an exhibition ground. Although not qualified under the regulations to receive the prize, Mr. Leonard Foster, of Leeds, wins a book for a Bank and Porch to a big hotel (which latter recalls a similar competition at Tufton-street). The Bank has a columned ground stage in stone, the superstructure being in brick; but the whole thing ranks as ordinary.

Although not in the same class, the work next to be mentioned is of an architectural kind, being a panelled design for a drawing-room by Mr. Horace C. Harvey, of Hackney (1265), and for which he is "commended." The decoration is Jacobean, with pendants from a rich plastered ceiling. Miss Elizabeth Anglin, of Deptford, has hanging near the last a series of drawings illus-

trating a design for a chancel decoration (1243), in which the judges say, "they regret to find evidences of the lack of a thorough study of style." This sanctuary east wall lacks all sense of style and of proportion also. The mural panels of Pelicans (pious and otherwise) are enormous, and out of scale with the weak little traceried window of Gothic detail, having a text inscribed on a blue ribbon, probably cut out of zinc, painted and stuck on round the top of the arch, and above the panels. The altar looks ridiculously small. The full sizes shown by Miss Anglin for the Altar Cross and Candlesticks are much better; the whole of the general scheme is bad, and shows work which ought to be avoided. The book illustration designs this year displayed near the last-named do not seem, on the whole, to be up to the standard of the last few years, but some of the studies for posters are suggestive, enough, such as the one illustrating an Art-school *Conversazione* by a man and woman in "full fig." passing into a doorway, and seen in silhouette against a brilliant interior.

Turning now to the exhibition generally, which, of course, in the aggregate, represents an enormous amount of work, and some capital results, we cannot attempt to mention all the examples worth note, and, therefore, shall confine our remarks briefly to those distinguished by Gold Medals. In this list there are only nine awards in England, and out of these four of the winners are disqualified by previous or concurrent success. Books are given in lieu of the Gold Medal in these cases. Mr. Arthur G. Small, of Birmingham, is given a Gold Medal for a Leather Box for Chessmen, with ivory mounts. At a first glance, this design looks very like a tobacco-jar. It is some six or seven inches high, in red leather, with the legend round the top, below the lid: "Keep what you want, cast what you can; expect nothing back once lost or given." The box is spaced into four compartments, with tooled female single figure in arched panels set out between pilasters diapered prettily with white and green. The ivory feet do not seem to belong to the leatherwork, and the crown knob to the lid, of the same material, looks somewhat out of character with it. No. 2 Gold Medal is won by Miss Agnes M. Hawker, of Bristol, for a Stencilled Border, which is most original, and quite a beautiful scheme, though we do not quite know to what precise use it would be applicable. The ribbon has four running reindeer behind conventional trees, the foliage of which forms the top of this frieze, and at the extremities, in circular panels, are seen a pair of North American hunters on the trail, and facing each other. The charm of this design is the varied or graduated white background suggestive of a snow effect. Mr. Louis Fox, of Leicester, takes the third Gold Medal for the Shaded Head from the Antique, or Michael Angelo's "Dawn," drawn with silver-point refinement, extreme delicacy of modelling, and an artistic power of reserve. The vertical delineation of the shaded tint of the background tends to enhance the rounded formation of the facial features admirably. The Marylebone students, the Misses Margaret Free and Gwen White, cannot take their Gold Medals this year; but they both well deserve them. Miss Free has a group in oil-colours, showing a gilded chair, a lady's striped frock, a sunshade, and other personal effects difficult to treat broadly and handle successfully in colour in a quiet and harmonious way. Miss White sends one of the few outstanding exhibits to be seen this year, and which creates a new standard for stained wood design and its capabilities. Her white wood triptych is a thing to be remembered for delicacy and

refined design and a pretty sense of colour. The pedimented head contains a lunette of lovers and the same idea pervades the interior of the side doors seen when open, all the figures being in Stuart period costume. The centre panel is occupied by a poem charmingly written, and round it is a foliated border rising to the frieze-like top, with Cupids in the corners driving ribboned peacocks, while in the midst is another god of Love on mischief bent, ready to dart forth in quest of further incidents. "The Rape of Persephone" is the subject of an excellently-modelled and finely-composed panel of a group of six lamenting nude maidens bewailing the discomfiture caused the youthful-looking Pluto in the chariot, who, with four horses, is hastily making off to Hades with his precious prize. The work is intended for a marble panel to be placed in the side of a library. Mr. Arthur Woodford, of Nottingham, wins a Gold Medal for this capital scheme; but its architectural accessories are not quite a success. That possibly would be expecting too much. Mr. Francis Wiles, of Dublin, deservedly obtains a Gold Medal for a charming model of a young girl, excellent in every way.

Miss Grace Lodge, of St. Marylebone, is to be praised for her "stained wood," or, as we should say, painted, corner cupboard, with tastefully diapered sides and jewel-like borderings, the big panel being peopled with goblins and characters from fairy tales, rich in colour, and pretty in effect. A Silver Medal was awarded for this (53). A like recognition is given to Mr. Frank D. Wray, of Wandsworth, for some solid good drawings from the nude in full lengths of well-chosen subjects, and of high standard in execution. Close by we noted a side back study of a splendid model glancing over her shoulder, and seen in profile—a promising piece of shaded performance by Mr. Ines O. H. Johnson, from the same school; from whence a graphic charcoal sketch of an itinerant minstrel male figure, by Mr. Charles W. Farley, who also won a Bronze Medal well. The Study of Drapery (85), by Mr. Frederick Savage, from Birmingham, is brightly handled, giving the texture finely of a full-length skirt on an antique figure of a woman. This was awarded a Silver Medal. Miss Cecilia Adams well merited her prize for an excellent enamel panel of a monk, rich in tone and handsome in colour (435). The stencilled panel design of a cock and hen in Japanese manner and style won a Bronze Medal (211) for Mr. R. E. Slarks; but its particular purpose in a nursery is not quite clear. Mr. G. E. Bradbury's modelled memorial tablet to Jeanne d'Arc 1412-1431 deservedly won a Silver Medal (47). The panel is vertical, and the girl is seated in a devotional posture, flatly modelled, the profile dominating the rest, the bower behind her being merely suggested and charmingly managed. A very different exhibit is Miss Eileen Greig's painted chest in greens and blues, ornamented with Celtic forms, and with figure panels in front (1281) of varied scale. The effect is too gaudy; but we see the work is "Commended." It comes from Hammersmith School of Arts and Crafts.

ROYAL COLLEGE OF ART.

This exhibition is held in the classrooms behind the Science Schools in Exhibition-road. Perhaps the most striking example of dashing draughtsmanship is an oval full-size study cartoon for a Ceiling Decoration, done in charcoal, red and white chalks by Mr. H. E. Staufen (95) displaying an involved composition of floating figures powerfully handled and intended for colour; but the artist's small colour studies hanging near hardly please us so well. The stained glass shown is better than usual and the cartoons are well done.

higher standard now than they did ten years ago, so that fewer pictures reach their standard now than did then. Of the pictures they saw ten years ago, only those remain in their memories which impressed them strongly, whereas in the present show all are equally before them, good, bad, and indifferent, which gives the impression of a lower average."—Henry Holiday's "Reminiscences."

Mr. P. R. Paul shows two panels for a nursery window, illustrating "A Child's Garden of Verses," by Robert Louis Stevenson. The execution of the bright effects in the horn-toned quarry panes below the figures are quite remarkable. Miss Mabel T. Eckersley, in the School of Architecture, shows some colour decoration and figure-work from Rome and Perugia, and Mr. E. H. Llewellyn's similar colour studies from Fontainebleau deserves attention, while Miss Nellie S. Flaxen attracted our notice by her graphic drawing of a sculptured pier from the Temple of Diana at Ephesus, which is here excellently expressed by shading. This student's "Medallion" has a poor figure, too big for the architectural setting. Her studies and designs for woodwork are in many respects excellent and capable.

The chief exhibit in the Architectural Gallery this year is the "Restoration of the Temple of Jupiter Olympus," of which some sixteen gigantic columns of the Corinthian order still stand in a S.E. direction from the Acropolis. Formerly this temple boasted of 124 columns, so disposed as to present a triple row of ten in each front, and a double row of twenty in the flanks, all in Pentelic marble, the total length of the building being 354ft. by 171ft. wide. The height is stated to be 58ft., including the architrave. The author of this admirable and scholarly set of restorations is Mr. W. G. E. Jones, who is accorded the Travelling Scholarship in Architecture for 1914. His principal drawing is a fine and large perspective, showing one end of one flank of the Temple, which is octostyle, and dates from 174 B.C., when it was erected by a Roman architect. Vitruvius says that the foundations were prepared by Antistates Callaeschrus, Antimachides, and Porinus, architects employed by Pistratus; but the work was abandoned. Somewhere about 350 years afterwards King Antiochus employed a Roman named Cossutius; but the ruins of his work have yet to be completely examined. This restoration, which does Mr. Jones so much credit, is based upon Perouse. We hope to illustrate it at the close of the Exhibition. There is a good House-front in the same room, prepared for the British Institute Scholarship, by Mr. G. C. Styles, and it is designed in a Classic measure, with an ingenious plan, after the modern French manner (57). We did not think much of "An Artists' Colony" (58), by Mr. P. H. Hanbury. Miss Beatrice M. Gower shows some designs for woodwork screens, and Mr. C. S. Tresilian, on the same wall, has one very good example, even if it is rather late in its detail. The same set of students exhibit designs for canopied fountains; but we could not allocate them, as they were not named.

In the Sculpture Gallery we noticed the panels submitted recently for the Music-room Mantelpiece in the competition for the British School in Rome Scholarship, by Messrs. C. S. Jagger, H. Wright, and B. Hancock, which we saw at Crosby Hall in Chelsea a few weeks ago. Their connection with the Royal College of Art display is not very clear. The figure statuettes in full length from the life, by Messrs. L. A. Smith and J. A. Floyd, seemed to us to be very excellent and reserved in their treatment. Mr. W. Marsden won the Travelling Scholarship for Sculpture by his design for a Monument to Shakespeare. The Etchings on this occasion are well shown in a separate room, properly draped to set them off to advantage. Architectural subjects are represented by Mr. W. M. Keesey, who is always capable, and by Mr. Ray Jones. "The Two Corbices," by Miss Dorothy B. Martin (49) is one of the best etchings exhibited this year.

THE ATELIERS.

The announcement of last week, that a second Atelier is to be opened, because the first is full, may have surprised some who were inclined to be pessimistic, or even opposed to the movement, at its outset. It used to be said that the affair was "un-English" and that it could never flourish, even in London. But this prognostication seems to have been due to an over-hasty patriotism, interested opposition, or ignorance of what the Atelier meant and was to stand for. From whatever quarter, and by whatever reason, it came, this prophecy has thus far proved mistaken, however, and those connected with the movement, whether they be the promoters or younger men who have been able to avail themselves of its advantages, have no reason for regretting the course they have taken. Further, all are satisfied that the method, which the Beaux Arts Committee was formed to introduce, now requires only its completion by the foundation of a second Atelier, which will compete with the first, to enable it to advance very substantially, to modify, and reform the training of architects in this country.

The Ateliers differ from schools and similar institutions in this, chiefly: that whereas the schools are schools, and, as such, subject to necessary organisation and restraint, the Ateliers are really clubs, and submit only to such regulations as the members think fit to impose upon themselves. At the present Atelier this regulation is very slight indeed. The membership includes men of all ages. Some have well-known names and practise in many styles—for the Atelier imposes no stylistic limitation. Others, the younger and more constantly working members, have come on straight from one or other of the schools. Many work in offices all day and come to the Atelier only in the evenings and at week-ends—the place is always open, and every member has his key. But, whatever their circumstances, all are convinced that for those, whether students or practitioners, whose chief interest lies in their work, there is no place like the Atelier for discussion, criticism, and design.

It is not so surprising as some might think, therefore, that many give up their leisure, after their day's work, to come along to the Atelier for the pleasures of conversation and the pains of design. The man who has made some name for himself, and the young draughtsman of ability, find themselves in an atmosphere which quickly develops their qualities and a company which gives them their due. They find also that they have to reckon with a stream of criticism which passes no slipshod thinking or unreasonable design. One or two have fallen away on this account, but the better part remains.

The young student who does not know his Orders, perhaps, advances rapidly and learns his forms as items in an interesting reality rather than as part of a process of tedious but necessary toil. At all stages he can call upon the criticism and assistance of his seniors. He sees the larger schemes being made and lends a hand on the big drawings where there happens to be something he can do. And all the time he listens, and, if he can, takes a part in the discussion which is always going on.

Free discussion and reasoned criticism are the watchwords of the Atelier. They imply an attitude and an outlook from which no sound designer has anything to fear; but also one from which meretricious work, be it by one on the last pinnacle of eminence or the height of some popular fashion, can hope only that its ruthless dissection may be tempered by a charitable, if contemptuous, regard for the conditions under which it is done. The matter is turned over and over, and anyone who advances an opinion must give also his reason, chapter and verse, in its support. In the Atelier, at least, the day is done with—indeed, it never was—when an opinion or personal preference passed as a decision of weight. A judgment there must be free and reasoned if it is to count at all.

The basic tenets of the Atelier are simple enough and applicable to all building and to all styles. The necessity the promoters were

under of going to Paris in the first instance for their model of procedure does not imply that we hold any brief for the French or Beaux Arts style of design, and, as a matter of fact, that style is very little practised. From the French methods of making, rendering, and presenting a drawing we have learned, and are learning, much. These methods are chiefly helpful in the direction of speed, in order to leave the maximum time for study, and have no necessary connection with design. But so far as external design itself is concerned, we find that English or Classic models are generally preferred. Apart from the method of presentation—which, after all, is of minor importance—what has been gained from Paris is the lesson which France is always prepared to teach the whole world in almost any line of endeavour. And that is the effort, and eventually the habit, of approaching every problem in a reasonable fashion, working from premises which are known towards the ultimate and definite solution.

Now the promoters feel sufficiently strong to run the second Atelier without any direct aid from France. Certain modifications will be made in accordance with the experience gained. Arrangements must be contrived, in so far as it be possible, to meet the conditions of London, which differ widely from those prevailing in Paris. For instance, a very substantial reduction in the fees is contemplated. Signs are not wanting also that the architectural world in London is altering some of its views to meet the Ateliers. The modifications in the educational side are already marked. They form the best possible commendation of the lead we have given. We look upon the efforts which are being made to follow our example with feelings of pleasure and hopes for their success.

These hopes are not solely altruistic, as at first sight they may appear to be. Those who were responsible for the inauguration of the movement have, from the first, realised that one Atelier, working away alone, cannot do all that an Atelier should, cannot fully display the strength of the method. For the root idea of an Atelier is that its members shall work together on, and take a proud interest in, the products of the Atelier as a whole, rather than that each member should work separately for his own hand. In this way some counteraction to the exaggerated individualism in design, which is our bane in England, is set in motion, and a man learns early to work with others, as, sooner or later, in architecture, at any rate, if he is to do permanent work, he must.

The work of the coming year should, therefore, prove exceptionally interesting, especially to working members. The Atelier method is now really to start, with all its essential parts; two, or more, Ateliers, competing under a common jury: two, or more, teams under a common referee. There is nothing un-English in this. We shall see indeed if men on this side of the Channel cannot pull together in the Ateliers as well as they contrive to do in any other direction in which they really try.

THE R.I.B.A. EXAMINATIONS.

The Preliminary Examination, qualifying for registration as Probationer R.I.B.A., was held in London and nine provincial cities on June 16 and 17. Of the 150 candidates admitted, forty-one were exempted from sitting, and the remaining 109 examined, with the result that eighty-seven passed and twenty-two were relegated to their studies. The passed and exempted candidates, totalling 128 altogether, are as follows:—

Cyril Edward Abbott, Gilbert Leonard Appleton, Douglas Gordon Armstrong, Harold Edward Asser, Morris Bader, Walter Barton, Albert Beasley, Clayton Moffat Bentley, Tom Blakeley, Howard Gilbert Boulton, Leslie John Bown, Eric Wensley Bragg, Faith Brooke, Frank Collin Brown, Bruce Burge, Alfred Vincent Butney Burr, William Frederick Cale, David Arthur Carmichael, Ronald Gundry Carnall, Harold Bertram Challen, George Stanley Chester, Benjamin Bernard Chevalier, Lionel Clement Erskine Clark, Henry Frederick Clarke, John James Collins, Ernest Cormier, Alexander Cullen, Murdoch Currie, Arthur Edwin Davidson, John Davies, John Alfred Depledge, Horace George Dolman, Thomas William Dowsett, Robert

Bancroft Dunkerley, Nicholas John Durant, Leslie Marriott Earle, Ralph Victor Eastman, Albert Edgar Eberlin, Harold William Edwards, Thomas John Evans, William Cecil Evans, Eric George Felgate, Alfred Stockley Foster, Albert Robert Fox, Harold Griffiths, Reginald Thomas Grummitt, Franklin Leslie Halliday, Charles Kendall Hanson, Frederick Claude Smith Harrison, John Holliday Hughtan, Edward Taylor Heath, Mark Oliver Hill, Percival Theodore Horns, Clifford Evans Holman, Felix Holt, Topham Becher Dabridgecourt Hough, James Houston, Cyril Ewart Howard, William Burrows Clement Hunkin, Norman Stuart Hunt, Harry Jackman, Harold Thomas Jackson, Francis Raymond James, William Peterson James, Frank Edward Jefferies, Harold Jones, Hume Victor Kerr, Edgar Graham Kiralfy, Albert Leslie Knott, Frank Henry Langley, Horatio Edward Arthur Larkum, Edgar George Latian, Edward Price Lavender, Alfred Drysdale Lewis, Archibald Ernest Lewin, Henry Thelwell Lloyd, Charles Roy Lynam, Matthew J. Lynch, Richard James Masey, Cyril Jack Mead, Clifford Edmund Mee, Bernard Alexander Miler, William Morris, Harold Leggett Mullett, Cecil Jack Noke, Edward James Nutt, Arthur Trevor Owen, Montague William Padgett, Edwin Pallett, Denis Hele Parrott, William Paulden, Leslie Frederick Phelps, Edwin Phillips, Aston Charles Pickett, Douglas Horace Selin Piteber, Edward James Potter, John William Anderson Poyer, James Rodfern, Stanley Reeves, Frederico Reina y Garcia del Busto, John Eric Reynolds, Charles William Robertson, Ronald Chard Rosevear, Charles Douglas St. Ledger, Bernard Cecil Senearate, Leonard Senyard, William Arthur Shannon, Archibald Althur Simpson, Eric Hayward Skipper, Lambertus Louis Theodor Sloop, Alfred Ewart Smith, Ernest Morris Smith, Thomas Steen, Harold Rocksby, Ernest Albert Streetfield, John Stuart Teasdale, John Thomas, Harold Warwick Thompson, Wilfrid Twiss, Michael Theodore Waterhouse, B.A. Oxon, Francis Howard Hippersley Webb, Harold Comington Wheatley, Guy Charlton Wilkins, Harold Douglas Williams, Herbert Trevor Bailey Williams, Arthur Wilson, Barry Ernest Wilson, Harry Wilson Wood.

The Intermediate Examination, qualifying for registration as Student R.I.B.A., was held from June 12 to 19. Eighty-one candidates were examined, of whom forty-seven passed and thirty-four were relegated. The passed candidates are as follows, the names being given in order of merit as placed by the Board:—

Austen St. B. Harrison, Thomas Rayson, Francis Milton Cashmore, Norman Pristo Keep, William James Watt, Neville Wynne Jones, Leslie Archibald Norris, Wilfrid Bernard Gosling, Henry Bartholomew Tunnard, George Saba Shuber, John James Douglas Burt, Leonard H. Foster, Thomas Smith Shearer, James Robert Blake, Wilfred Henry Harris, Thomas Moss Bridge, Joseph Dawson Gordon, Edgar Lync, jun, James Monteith McLean, John Adams Webb, Norman Arthur Blackburn, Joseph Rushbrooke Keyte, George Vyvyan Spruway, Frederick Wentworth Turner, Harold Morgan Lewis, John Stewart Thomson, Richard Ross Neely, George Bevan, jun, Harry St. John Harrison, Thomas William Vivian May, Horace Beverstock John Nelson Meredith, Reuben Walter Carey, Francis Eric Gooder, Leonard Heywood, Charles Allen Hinton, William Donald Key, John Gordon McBeath, Ion Beresford Pite, Clement Lawrence Pope, William Carter Preston, Percy William Rollin, Lester Howard Sacre, Norman Woodford Slater, Harley Clarence Victor Strickland, Albert Stringer Tanner, James Bernard Millard Walsh.

The number of failures among the relegated candidates in each subject of the Intermediate Examination was as follows:—

A. Principal Styles and General History of Architecture	5
B. 1. Simple Applied Construction	18
B. 2. Theoretical Construction	14
C. 1. Historical Architecture:—	
(a) Greek and Roman	1
(b) Byzantine and Romanesque	—
(c) French and English Gothic	3
(d) Italian, French, and English Renaissance	1
C. 2. Mathematics and Mechanics	—
C. 3. Design	22

The following Probationers possessing the certificates required under the regulations were exempted from the Intermediate Examination, and have been registered as Students, viz.:—

Howard Dennis Archer, Thomas Braddeok, David Arthur Carmichael, Edward Robinson Ferrihand Cole, Ernest Cormier, Arthur Edwin Davidson, Harold John Hugh Dicksee, Thomas William Dowsett, William Harkess, Bernard Alexander Miller, Robert Ainslie Threadgold, Arthur Wilson.

The Final and Special Examinations, qualifying for candidature as Associate R.I.B.A., were held in London from June 25 to July 3. Of the ninety-one candidates examined, forty-five passed, and the remaining forty-six were relegated. The successful candidates, given in alphabetical order, were as follows:—

Richard Anderton, Richard Alfred Barber, Herbert Phillips Bryant, Andrew Stuart Burnett, George Wilfred Calderer, Kenneth Cameron, Walter Llewellyn Clark, Harold Thoresby Cooksey, Colin Addison Dickeson, Edward Harold Montague Ebbs,

Joseph Charles Fowell, William Hubert Godwin, William Holgate Harrison, Frank Hearne, James Hembrow, Ernest James Hickman, Percy Howard, Basil Hughes, William John Isaac, Eric Rawlstone Jarrett, Bernard Jessop, Albert Frederick Kaitenbach, Frederick Lawrence Kruckenberg, Godfrey Horton Ledger, William Leonard Boghurst Leech, James Macgregor, Ebenezer James Maclac, Egerton Alwyn Lawer Martyn, Stanley Russell Miller, Abdulla Bhangsi Peermahomed, Thomas Luff Perkins, Richard Manning Haig Philp, Geoffrey William Ridley, Cedric Gurney Ripley, Horace Edwin Rolley, Arnold Silcock, Charles Ernest Stafford, Gerald Stanley, Herbert Samuel Taylor, James Oshert Thompson, Gilbert George Lee Tyte, Harold Gerard Waddington, Percival Mitchell Ware, Charles Taylor Whiteley, Arthur Jackson Wood.

The number of failures among the relegated candidates in each subject of the Final Examination was as follows:—

A. Design	32
B. Construction:—	
(1) Foundations, Walls, Roofs, &c.	27
(2) Iron and Steel	35
C. Hygiene	21
D. Properties and Uses of Building Materials	11
E. The Ordinary Practice of Architecture ...	20
F. The Thesis	2

Every candidate for the Final Examination is required to submit among his Testimonies of Study a thesis showing advanced and individual work in one only of the following subjects:—(1) Historical Architecture; (2) Science, as applied to Building; (3) Design, including Decoration. The thesis, which may be either an illustrated essay or a design with a detailed report, is assessed by examiners specially appointed for the purpose, who also examine the candidate orally in his thesis. Since this regulation came into force, the following candidates have obtained distinction in their theses on the subjects indicated below:—

December, 1912.—William Godfrey Newton "The Contribution of Imperial Rome to Architectural Development." William George Thoms "Working Drawings of a Factory, with all construction and details fully worked out, stress diagrams and calculations, and a detailed and comprehensive report thereon." June, 1913.—Joseph Hill: "The Gothic Towers of England." William Wilson Munno: "The Medieval Spires of England, their Design and Construction." December, 1913.—William Wallace Frikin: "The Problem of Reverberation in Buildings." Harry Beckett Swift Gibbs: "The Life and Work of James Gibbs, Architect." Henry Birkett Leighton: "Electricity and its Application to Buildings." William Paterson: "The Growth and Development of the Medieval House." June, 1914.—James Oshert Thompson: "Elementary Education and Physical Culture."

LONDON COUNTY COUNCIL.

At the very close of the protracted meeting of the Council on Tuesday, the last to be held before the recess, the Special Electricity Committee presented a report based upon the one proposed by Messrs. Merz and McLellan in March last, and recommended the promotion by the Council of a Bill next session to establish a fresh undertaking and a fresh authority for the purpose of controlling its operations, which would, if sanctioned, be actually carried out by a private company. The Committee considered that for the supply to the county town of London a new electricity authority is preferable, consisting of but thirty-one members, of whom the majority would represent the London County Council, and the rest the neighbouring county councils and county boroughs. The new authority will be empowered by Parliament to set up a new undertaking with a two-fold object:—(1) The gradual establishment of large generating stations down the river, from which supplies in bulk will be given to such existing undertakings as wish it. (2) The right to acquire by agreement existing undertakings, whether municipal or company, and combine them so as gradually to bring about one unified scheme. It is proposed that the electricity authority or its constituent bodies should share in the profits of the undertaking, and be liable to make good any loss out of the rates. It is proposed that two-thirds of the capital for the new works should be found by the electricity authority, and the whole of the money for the purchase of the existing concerns by this central authority, the remainder to be found by the company to whom the management of the undertaking would be handed over for a period of fifty years. To insure continuous control, the appointment of a statutory

technical committee is recommended, a more or less permanent body which will be responsible for seeing that the operations of the company are technically sound, and that the money allocated to it is properly spent. The public authority, however, retains the final control of all funds voted by it. The committee, it is suggested, should consist of the chairman of the authority (ex officio), the engineer of the authority, the financial adviser to the authority, and an outside member appointed by the Board of Trade. The area to be covered is 964 square miles, with a population of 7½ millions. It contains seventy existing undertakings, and about eighty electric generating stations; 60 per cent. of the electricity sold in this area is at present produced within the county of London. After a short discussion the reception of the report was, by consent, postponed until after the recess.

The Highways Committee recommended the Council to put in hand the construction of a connecting double line of electric tramways between Lea-green and Eltham directly Parliamentary sanction is obtained under the Bill which has now passed both Houses; to reconstruct the trackwork of the tramways in Burdett-road, etc., from West India Docks to Penhurst-road, and to provide an additional weather shelter on the Embankment at Blackfriars Bridge. These recommendations were agreed to.

The Council considered a recommendation of the Establishment Committee to the effect that, the terms of the contract notwithstanding, payments in advance be made to Messrs. Holland and Hannen and Cubitts, the contractors for the building of the new County Hall, in respect of materials delivered on the site but not fixed. The committee thought it desirable that such advances should be made, having regard to the abnormal demands which would obtain when the present labour dispute in the building trade was settled, to the delay which might arise if the material worked specially for the new County Hall was not delivered by the time by which it was required, and to the possibility of the sub-contractors suspending their operations on work relating to the new County Hall. Mr. E. R. Debenham, the chairman of the committee, said that those who would receive the money would be, through the contractors, those sub-contractors outside London who had no dispute with their workmen.—Mr. J. D. Gilbert, who moved that the recommendation be referred back, asked for an explanation of this statement, in view of the fact that the Council had decided that the stone should be worked in London.—Mr. Jesson seconded.—Mr. Debenham stated that no payment would be made for any work done in London, except to the quarryman for having the stone worked up in London, as stipulated, and Mr. I. Salmon said that the undertaking that the stone should be so worked had been faithfully kept. After further discussion as to whether in doing as proposed the Council would be "taking sides" in the dispute, the reference back was defeated, on a division, by 67 votes to 42, and the recommendation approved.

Messrs. W. E. Blake and Co., Ltd., of Fulham, having given an assurance of their preparedness to comply with the requirements of the Council in respect of rates of pay and conditions of labour, their tender for the construction of the new Sessions House at Newington, within a period of twenty-one months, has, it was reported, been accepted.

The Council having last week decided to undertake, at an estimated cost of £80,000, the widening of Grove-road, Bethnal Green, between Wennington-road and the north side of the bridge carrying Grove-road over the Hertford Union canal, the Improvements Committee now stated that it is desirable that there should be no delay in the execution of the improvement, and they accordingly recommended that tenders should be invited from selected firms for the reconstruction in reinforced concrete of this bridge, and for the execution of paving works in Grove road. The same Committee

recommended approval of the leasing, at £8,750 a year, of a site on the west side of Kingsway at its junction with Aldwych. The site has an area of about 23,230 square feet and frontages to Kingsway and Aldwych of about 253ft., to Drury-lane of about 114ft., and to Kean-street of about 121ft. They further advised the approval of drawings for a branch bank to be erected at the corner of Kingsland High-street and Dalston-lane for the London and South-Western Banking Co., Ltd. The elevations will be in Carrara ware, with a granite base.

The Building Act Committee recommended that application be made to Parliament in the session of 1915 for an amendment of the London Building Act of 1894, section 122, in order to provide that it shall not be lawful for any person, upon land of which the surface is below the level of the highest tide, and which is so situate as not to admit of being efficiently drained at all times by gravitation into an existing sewer of the Council, to erect any building except with the permission of the Council, and subject to, and in accordance with, such regulations as the Council may from time to time prescribe with reference to the erection of buildings on such land. This would make the section applicable to all buildings and to the area between the highest tide, instead of, as at present, only to the area below the level of Trinity high-water mark.

An interim report on the question of the playgrounds of new and existing schools was made by the Education Committee, arising out of the recent report on playgrounds of the Departmental Committee of the Board of Education. The Council's Committee recommended:—

(a) That the Council concurs in the following recommendations of the Departmental Committee of the Board of Education on Playgrounds:—*New Schools.*—(i.) The shape of the playgrounds should be more carefully scrutinised, and passages, forecourts, etc., should not be counted as forming part of the minimum space required. (ii.) (a) Except in very small schools, playgrounds should be separate for boys and girls. (b) The playgrounds for girls and infants need not be separated. (v.) That—(a) Where a site is expensive (regard being had to the price of land and the resources of the authority), the Board may accept a playground below the measurements specified in section iv. (a) and (b) below. (b) The precise degree of reduction from this standard shall be decided on the merits of each case, but in no case shall the reduction bring the playground below the measurement specified in section iii. (a) and (b). (b) That the playground areas set out in the following recommendations (iii. and iv.) of the Departmental Committee on Playgrounds be taken as the standard in the case of new schools—(iii.) Where other provision is made for games—(a) Each undivided playground for 200 children and upwards should provide—(i.) 20-sq.ft. for each older child. (ii.) 16-sq.ft. for each infant. (b) Each undivided playground for less than 200 children should provide 2,000-sq.ft. together with—(i.) 10-sq.ft. for each older child. (ii.) 6-sq.ft. for each infant. (iv.) Where no other provision is made for games—(a) Each undivided playground for 200 children and upwards should provide—(i.) 20-sq.ft. for each older child. (ii.) 16-sq.ft. for each infant. (b) Each undivided playground for less than 200 children should provide 2,000-sq.ft., together with—(i.) 20-sq.ft. for each older child. (ii.) 6-sq.ft. for each infant. *Existing schools.*—(c) That, in view of the fact that the Board of Education do not propose to depart from their present practice in regard to playground areas in existing schools, the Council do make no change in its present practice of considering the case of each school on its merits. *General.*—(d) That, provided that the question of roof playgrounds is considered on its merits in each particular case the Council concurs in the following recommendation of the Departmental Committee of the Board of Education on Playgrounds—(x.) A roof playground should be accepted, and if it covers virtually the whole of the building should be regarded as satisfying the requirements of the children, other than infants occupying one floor.

The Council decided, after some discussion, that application be made to Parliament for authority to lease land with frontages to important thoroughfares when such lands had to be acquired as part of an estate, the remainder of which the Council may decide to acquire and dedicate for use as a public open space.

Asked whether it was a fact that the purchasers of the Duke of Bedford's estate had offered to sell the whole or part of it to the Council, Mr. Andrew Taylor informed the Council that the purchasers had submitted proposals with regard to the estate, but the Improvements and Public Control Committee had recommended the Council not to purchase any part of the property.

BUILDERS' BENEVOLENT INSTITUTION.

The sixty-seventh annual general meeting of the Builders' Benevolent Institution was held at Koh-i-Noor House, Kingsway, W.C., at 4 p.m. on Wednesday, July 22. Mr. Frederick Shingleton, M.V.O. (president) was in the chair. The annual report and audited accounts for the year ending July 7, 1914, were read and approved. The following elections took place:—President: Mr. George R. Holland (Messrs. Holland and Hannen and W. Cubitt's, Ltd.). Treasurer: Mr. Frank May, J.P. (Messrs. Holland and Hannen and W. Cubitt's, Ltd.).

The following members of the committee retired by rota and were re-elected: Sir John Mowlem Burt, J.P.; Mr. J. Carmichael, J.P.; Mr. A. B. H. Colls, Mr. F. J. Dove, Mr. W. Downs, Mr. Edmond J. Hill, Mr. Fredk. Higgs, Mr. R. J. Holliday, Mr. Frank M. May, Mr. L. C. Randall, Mr. E. S. Rider, Mr. T. F. Rider, Mr. Thos. Stirling, Col. G. Haward Trollope, V.D.; and Mr. Hubert S. Ward, F.C.A.

Hon. Auditors: Mr. John T. Bolding and Mr. Hubert S. Ward, F.C.A.

Additional Trustees: Mr. George R. Holland (Messrs. Holland and Hannen and W. Cubitt's, Ltd.), Mr. H. Arthur Bartlett (Messrs. Perry and Co., Bow, Ltd.), Mr. A. B. H. Colls (Messrs. Trollope and Sons and Colls and Sons, Ltd.), Mr. J. W. Chessum, J.P. (Messrs. J. Chessum and Sons).

Various alterations were made in the rules of the institution.

RESEARCH WORK ON WATER EXAMINATION.

At the meeting on Friday of the Metropolitan Water Board the Water Examination Committee stated that they received an exhaustive report prepared by the Director of Water Examination respecting the work carried out at the Board's laboratory during the twelve months ended March 31, 1914. This report, the tenth by the director, appears, the committee add, to be not only of scientific interest, but of great practical importance. The report deals with seven subjects:—(i.) Search for pathogenic microbes in river water and sewage. The director's long-continued researches lead him to conclude that the typhoid bacillus cannot be uniformly present in raw river Thames water in the proportion of 1 typhoid bacillus per 9 c.c. of water. This is an important conclusion, because it can be shown by other tests that the river water is purified at least 1,000 times before delivery to consumers. As regards sewage, the director has shown that the typhoid bacillus cannot be uniformly present in the proportion of 1 typhoid bacillus per 0.00066 c.c. of sewage. Now, 0.00066 c.c. of sewage contains 704 excremental bacteria, which is about the number present in 17 c.c. of river Thames water, and, as previously noted, the river water is purified at least 1,000 times before delivery to consumers. (ii.) Methods for the isolation of the typhoid bacillus. Bacteriologists are constantly searching for some method enabling them to isolate with ease and certainty the typhoid bacillus from infected materials. The director has instituted a critical comparison between the (1) direct malachite green solid, (2) indirect liquid oxgall, and (3) indirect liquid brilliant green methods. He has obtained far the best results by the first method, which is the one he himself has used for a number of years. (iii.) Influence of temperature on the vitality of the typhoid bacillus. The director has carefully repeated his previous experiments, and confirms the view he has already expressed—namely, that the typhoid bacillus lives much longer in very cold water than in water at summer temperatures. Adequate storage of river water would thus seem to be of special importance during the five cold months of the year (January, February, March, November, and December). (iv.) Study of streptococci in excremental matters. The director was the first to advocate the use of the streptococcus in the examination of waters. Since then (1898) a great deal of work has been done on

the subject, and recently American bacteriologists have been seeking to show that human excremental matter can be distinguished from the dung of the lower animals by the streptococcus test, used quantitatively. The director has investigated these claims in an exhaustive research; but the matter is of so highly technical a character that the report itself must be consulted in order to appreciate the significance of his conclusions. (v.) The value of storage. There are few persons who still remain in doubt as to the value of storage; but the exact reason why stored waters are so much safer than raw waters is matter for speculative inquiry. The director supports the devitalisation theory, and does not consider that purely physical, mechanical, or chemical changes suffice to explain the observed phenomena. (vi.) Lime as a bactericidal agent. The authorities in charge of the Columbus (Ohio) Water Purification Works have already taken advantage of the information set forth in the director's eighth research report to improve the efficiency of their plant. The director shows that if their results and conclusions are read in a broad and tolerant spirit they afford valuable confirmatory evidence of the correctness of his original investigations. (vii.) Vitality of the cholera vibrio outside the animal body. In conclusion the director shows that Greig's researches in India amply corroborate his own "findings" as regards the typhoid bacillus.

HOUSE-BUILDING IN BRISTOL.

LESSENING STRUCTURAL COST.

The Bristol sanitary committee arrived at an important decision on July 23, on a point that will affect house-building in that city, and will mean a saving in initial cost and in subsequent expense due to repairing roof-leakage. Under the Improvement Act, Bristol possesses special local powers, and by enforcing one provision of that measure the civic authorities have hitherto required each house to be divided from its neighbour by carrying up the party-wall above the tiles or slates. In future these projecting walls or parapets will not be insisted upon. The matter arose, says the *Western Daily Press*, on the following report read by the clerk, Mr. Wise:—

"With reference to the housing scheme now being considered by the housing of the working-classes sub-committee, drawings have been submitted by the city valuer, in which parapet walls (required under Section 35 of the Bristol Improvement Act) have been omitted, and the attention of the sub-committee has been called to this, and a statement made that, if the sanitary and improvement committee insist on the provision of these parapet walls, the cost of building at Parson-street, where it is proposed to build 136 houses, would be increased by £800, and, at Stapleton-road, where the number proposed is 115, by £450. In November, 1904, the Bristol Society of Architects petitioned your committee to repeal the clause in the Improvement Act referred to above, and in February, 1905, the late city engineer reported the results of inquiries he had made on this subject from thirty-nine local authorities of the largest towns in England, which showed there was a growing tendency to omit parapets on domestic buildings under 35ft. in height, but to require them on warehouses and factories, and he recommended that clause 35 should be so amended as to read, after the word 'building':—

And it be enacted that all separate side walls or party walls shall be well and closely lined up to the underside of the slates upon the roofs of the buildings, and that in all domestic buildings under 35ft. in height, the slates, tiles, or other incombustible roof covering shall be properly and solidly bedded in mortar or cement on the top of such wall; but as to all public buildings, chapels, places of worship, breweries, distilleries, manufactories, and warehouses, proper parapets of the height and thickness as specified for party walls shall be built on such side walls or party walls."

"Your committee, however, decided that it was not desirable to go to Parliament for powers to amend the Improvement Act.

Fraser H. Stevens, Photo.

THE BRISTOL GENERAL HOSPITAL EXTENSIONS.—Messrs. OATLEY and LAWRENCE, Architects.

Rough elevations have been supplied by the city valuer, but before going further the sub-committee ask for your committee's decision on the point. Your engineer sees no great objection to the omission of the parapet walls, provided the party-walls are carried right up to the underside of the tiles; but, of course, if this is allowed in the present case it will be very difficult for your committee to enforce their provision in the case of private buildings."

The chairman of the committee (Alderman Lloyd) asked Mr. Wise to explain the legal position.

Mr. Wise said he did not recommend the committee, if they thought these parapets should be done away with, to attempt to get the Bristol Improvement Act altered in Parliament. That was a question they had considered on many occasions; but owing to the fact that powers were given by that Act which would not now probably be granted, the effect of going to Parliament to do away with one provision would be that their powers in other directions would be taken away. He thought, however, they need not let the provision stand in the way. If the conclusion, as a matter of policy, was that these parapets should not be required in cases of buildings of small height, treating everyone and the public alike, he thought they might waive the provision.

Mr. Coole said he was greatly in favour of the suggestion that the parapets should not be insisted upon. For years in St. George they did not enforce them, but when St. George was brought into Bristol in 1897 new houses were required to have these walls carried up. He hoped if they did anything at all it would not be for a particular committee, but for the public at large.

The Chairman said he could not conceive they would favour a committee of the council and not the general public. If they consented to this, builders must know, and must be allowed to do exactly what they were doing as a corporation.

Mr. King asked if the change proposed was not better for the tenant?

The Chairman: You could not have a better authority than Mr. Coole.

Mr. Coole replied that the houses were better without the parapets, there being less liability to leakages.

The Sheriff (Mr. Cottam Castle) suggested that parapets had an advantage in case of fire.

Mr. Forestier Walker said it was unquestionably a fact that insisting on the erection of these parapet walls prevented

hundreds of houses going up at Avonmouth. The extra walls made a difference to the builders, and prevented houses being erected.

Mr. Thorne gave it as his experience that there was less trouble of leakage without parapets.

Mr. Dowling supported the proposal to omit parapets, providing the tiles came down on the wall.

The Chairman remarked that the tiles or slates would have to be cemented to the top of the wall.

Mr. Coole moved that the construction of these walls be not insisted on.

Mr. Maggs seconded this. He asked, seeing the committee were so unanimous about this thing, was it not strange the thing should have been allowed to go on so long?

The Chairman: We grow in knowledge. You agree with what the late engineer recommended, that this exemption should apply to domestic houses of a certain height, while power is still retained to deal with factories and other buildings of large height.

The resolution, framed on the lines suggested by the chairman, was unanimously carried.

THE BRISTOL GENERAL HOSPITAL EXTENSIONS.

The new wing of the Bristol General Hospital, opened on Monday last, has been erected at a cost of £40,000. The architects are Messrs. Oatley and Lawrence, of Bristol.

Provision is made for a female ward with sun balcony facing south; a maternity ward, for the reception of the very poor in difficult cases, and a new dental department, which has hitherto been carried on at Colston-parade. The maternity ward contains twelve beds, and the female medical ward twenty-five beds. The building also includes accommodation for resident medical staff, registrar's room, accommodation for lady students, and additional bedrooms for nurses, as well as dining-halls for nurses and the sisters. In connection with the medical ward there is also a new clinical laboratory. The garden roof is a feature that will be much appreciated by those who are concerned in the work of the hospital. The builders were Messrs. W. Cowlin and Sons. The position of the wing could scarcely be bettered. It affords uninterrupted sunshine and air, and has an excellent outlook. On the basement floor are placed: The dental department, containing an entrance from Commercial road; porter's room; two surgeries; recovery-room; conversation-

room, arranged for eight chairs, in the first instance, with space for increasing the number to twelve or more when required; also a workroom and offices; dining-room accommodation for sisters and nurses and also for laundrymaids; new laundry, consisting of receiving-rooms, washhouse, drying department, with the ordinary modern dry-closet system, through which hot air is blown by an electrically-driven fan, also a place for the slower drying of woollens; finishing-room, airing-room, and room for sorting and packing. On the ground floor are six suites of private sitting-rooms and bedrooms for resident officers; officer's smoking- and common-rooms; mess-rooms for men students and lady students, and also for the matron and assistant matron; private room for the visiting staff; registrar's room, and sundry offices. The first floor is devoted to women's medical twenty-five-bed unit, comprising a ward of twenty-two beds with sun balcony at the south end; one single-bed ward, and one two-bed ward; sister's room; ward-kitchen; larder, and the necessary rooms for sorting linen and patients' clothes; also a sanitary wing containing the usual equipment. The second floor is another twenty-five-bed unit, as it is capable of being converted so as to provide accommodation practically identical with that on the first floor, but it is now arranged as a maternity ward for twelve beds—ten in a large ward and two in a separate ward. It contains a day-room, which room can serve a double purpose, it being possible to wheel the babies' cots into it at night. At the south end is an open-air balcony large enough to contain all the beds if desired. The administrative portion of the ward is much the same as on the floor below, but contains a room for washing the babies, an operating-room, a room where patients may change and bathe upon arrival, and also a changing-room for the surgical staff. On the roof of the ward is a garden or airing-ground for the women patients. A fire-escape staircase is provided at the southern end of the ward communicating from the roof-garden and from each floor level to the ground. At third floor level the nurses' sleeping accommodation has been extended by the provision of twenty-two additional rooms. The building is constructed of fire-concrete. It stands on concrete pillars carried down to the rock, which lies at a depth of about 30ft. below the ground, and the construction is arranged so that, for the most part, it would be possible to clear away all the internal partitions and build others in,

new positions without in any way interfering with the main construction of the building. The heating is by low-pressure hot-water, the circulation being accelerated by means of electrically-driven pumps. In the large wards the warming is supplemented by open fires in the centre of the floor. A water-softening plant has been provided having a capacity of 1,000 gallons per hour. The softened water is used for the hot-water supply, laundry purposes, and boiler-feed make-up. It is estimated that the introduction of this plant will save something like 50 per cent. in the cost of soap and 35 per cent. in the cost of soda. The new pathological department has been erected on land behind the museum.

THE NATIONAL FEDERATION OF BUILDING TRADES EMPLOYERS.

THE CARDIFF MEETING.

[FROM OUR OWN REPORTER.]

When the delegates to the half-yearly meeting of the National Federation of Building Trades Employers of Great Britain and Ireland met, at Cardiff, on Wednesday morning, they read, with prolonged cheering, the result of the ballot of the members, and unanimously adopted the recommendation of the Executive Council to declare a lock-out of the operatives of the 12 unions which remain obdurate in the London dispute, unless they come to a settlement with the masters on or before August 15. This ultimatum was posted to the Secretaries of the various unions on Tuesday night.

The result of the ballot was:—

For lock-out	7,319 votes
Against lock out	1,739 votes

Majority for ... 5,580

The delegates, therefore, entered the conference with full knowledge of the figures, but there remained a feeling of expectancy and anxiety as to what the recommendation of the Executive Council would be in face of that result. Mr. William Thomas, of Cardiff, the year's president, presided over an unusually large attendance, representative of the whole Kingdom, and they possessed themselves in patience during the official welcome given by the Federation to the City by the Lord Mayor (Alderman James Robinson), who was thanked on the proposition of the president, seconded by Alderman Jessop (Huddersfield), and supported by Alderman Bowen (Birmingham).

The Secretary (Mr. A. G. White) then read the report of the Executive Council as follows:—

The Executive Council adopted the report of the Administrative Committee on the result of the ballot for a lock-out, which was: 7,319 votes for, and 1,739 against. (Loud cheers.) It despatched the following ultimatum to Executives of the general unions or trades which are still obdurate:—

Dear Sir, I am instructed to give you notice that unless the present dispute in London is brought to an end so far as your society is concerned on or before August 15 next, this Federation will issue instructions for an immediate lock-out of the members of your society.

Whilst this Federation regrets that any such course is necessary, I am desirous to point out that this action has become imperative in consequence of all reasonable suggestions for a settlement put forward by the accredited representatives of the employers and operatives having been rejected by the London operatives, although accepted by the London employers.

This Federation has always recognised and appreciated the general, loyal observance of agreements by your society throughout the provinces; but it is obvious that if a section of your society in London can successfully break agreements that have been entered into, after all formal requirements on either side have been complied with, and can receive the support of the provinces, then no agreements throughout the country will any longer be a safeguard to the trade.—Yours faithfully,

A. G. WHITE (Secretary).

UNIONS CONCERNED.

The Secretary added that the last paragraph of the ultimatum had been omitted from the communication sent to the last four societies in the following list, because they had no rules previous to the dispute. The names of the societies were: The National Association of Operative Plasterers, the Operative Bricklayers' Society (London

Order), the Amalgamated Society of Carpenters and Joiners, the General Union of Carpenters and Joiners, the United Operative Plumbers' Association, the London Plumbers' Society, the National Union of Operative Heating and Domestic Engineers, the United Builders' Labourers' Union, the National Union of Gasworkers and General Labourers; Navvies', Builders' Labourers', and General Labourers' Union; the United Order of General Labourers of London, and the National Amalgamated Society of Operative House and Ship Painters and Decorators.

The Executive Council further resolved that it be called together again on August 18, to receive the report, and that, meanwhile, the Administrative Committee be empowered to deal with any matter that may arise under this issue.

This report was discussed in private, and it was afterwards announced to the Press that the report and recommendation of the Executive Council had been unanimously adopted, with the utmost enthusiasm.

OTHER SUBJECTS.

The President gave a hearty welcome to the representatives from South Africa and New South Wales and from the International Federation, and remarked that their presence showed how combination amongst employers of labour was spreading, not only throughout the Colonies, but on the Continent. About two months ago he had the pleasure, with the Secretary and the President of the Institute of Builders, of attending the meetings of the International Federation in Holland, and he was glad to report that the United States employers had now promised to become allied to the international movement. (Applause.)

Mr. B. I. Greenwood (London), in supplementing the President's welcome, said it was true they spoke different languages, but there were some characteristics which were international, and some phases of human character were common to all nations. They all had similar interests, wherever they lived they all desired to act fairly by the men whom they employed—(hear, hear)—but they were also determined not to be frightened and overborne by the men they employed. (Applause.) They all understood and recognised the sanctity of agreements, in whatever nation they happened to be born. (Renewed applause.)

Mr. F. Van Ophem (Belgium), representing the International Federation, said he brought "the greetings of your European fellows, and of expressing to you their feelings of friendship and admiration for your great and splendid nation. I apologise, gentlemen, for not speaking the English language perfectly; but I hope that, in the early future, I shall be able to express myself more correctly, and thus be better able to discuss the questions which have crossed the frontiers of our respective countries, the international solution of which is forced upon us by the growing and prosperous movement of international labour organisation. More and more we must devote ourselves to these relations between countries, and if in England, on account of a great economic progress, the immediate necessity of these international solutions is, perhaps, less evident, it may, however, be affirmed that there is something useful for every country in the examples taken from another. This is the reason why the International Federation is so glad to number among its members the English associations, thus allowing it to form a hearty friendship and to find at its meetings and congresses the support of your practical and authorised advice.

"The International Federation doesn't seek to touch national autonomy in any way, for this must be complete; but it tries to establish very close bonds between all associations which in the world endeavour to improve our industry and make it tranquilly prosperous, by dispelling disputes and by making them less violent, and, above all, less prejudicial to the people who bear their effects. Your office, gentlemen, as ours, and as that of all men of order, is to see disappear from society the acute disputes which

leave, to victor and vanquished alike, a feeling of hatred born of the bitterness of the struggle. But the desire for conciliation, great as it may be, must never make us forget or deny those principles which ought to be considered as sacred.

"Once more you have given a proof of the spirit predominating in your Federation, by the solution of the London Building Trade dispute. In this you showed a very large spirit of conciliation; but, at the same time, you showed, too, that the solidarity between your associations and their members was not a vain word, and, if it had been necessary, a national lock-out would have come to the support of your rights; and you showed also your decision not to yield before the omnipotence of labour. We must congratulate you greatly, and we thank all the active and devoted men who, in the hour of difficulty, were found standing in the breach for the defence of your interests. From this disturbance, which could easily have overturned, economically, an entire nation, the International Federation will, after you, carefully draw conclusions and transmit them to all its members, in order that at future meetings they may contribute to support the principles or rules of which we can generalise the application, taking into consideration the customs, habits, and necessities of each individual country. You see, gentlemen, the International Federation has only one object: to inform and to be informed, to be the recording centre of all experiments, of all initiative, and to put itself at the disposal of all, in order to help to enrich the national domain by international wealth. A country such as yours, with her glorious past and her preponderating progress, is called upon to help international efforts which aim at the creation of continued connections between associations of various nationalities, but of similar tendencies. From these connections are born close and hearty bonds, because, knowing each other better, a mutual appreciation and friendship follows. If this international understanding could become a reality in all classes of society, countries and nations could work in peace, and all the clouds which bear so heavily upon the economical progress of peoples would be dispelled.

"Gentlemen, I have been led too far away from my subject; but if I have insisted at some little length, it is because I think the collaboration of the English Federation absolutely indispensable if we are to realise the objects of the International Federation. The recent meetings of our Executive Council, which Messrs. Thomas, Rice, and White attended, have shown that the bonds established between the European associations of our industry have been riveted for practical reasons, and will have a happy influence in some countries where the organisation of employers is not in a very flourishing state. We hope to meet you all at Berne, at our congress, to which I here reiterate a formal invitation. You need have no fear of difficulty on account of language; we have arranged for several interpreters to hold themselves at the disposition of English-speaking delegates. You shall see at Berne that our efforts are far from being unproductive, and that the understanding between the federations of various countries is true and permanent, because it is established on a firm basis.

"Next year we shall hold an important meeting at San Francisco; it will allow us to make a very interesting and instructive trip, and will bring us into contact with the American Building Trades Employers and their institutions. At the end of this trip, we shall visit the great American World's Fair, and join the delegates of the United States and Canadian Associations in a general meeting, which will, I hope, bring about the adhesion of their associations to the International Federation. At the present moment this Federation counts nearly one hundred thousand members, and we are persuaded that next year we shall count, with the American members, one hundred and fifty thousand. If we pin our faith to the value of numbers, certes this Federation is important, from the fact that in our days more than one hundred thousand Building Trades

Employers, face to face with international labour concentration, have shown an imperative desire to unite for the defence of their interests. If, on the contrary, we consider only the existence and working of the International Federation, we learn that the employers are following the evolutions of progress, taking their wise resolutions and finding their strength in a close union of all those, whatever their nationality, who have at heart the development of our industry far from revolutionary agitations. To-day, when everything belongs to democracy, it is good to affirm that a strong desire of social peace must not force us to abandon the principles of untouchable dignity. You will help us to affirm these principles, and, asking for your support, I am certain that I shall find it always inspired largely by those feelings which have always done honour to the great English people. I wish to your labours, gentlemen, fruitful results for the prosperity and greatness of your industry and your Federation."

Mr. Carr (Durban) said they had some labour difficulties in South Africa, but they were facing them boldly and meeting them with a considerable measure of success. (Hear, hear.)

Mr. Ridge (New South Wales) said Australia was generally credited with being in advance of England in dealing with labour problems, but it was open to doubt, for the Labour Government in power gave as much favour as they could to the men's unions.

HALF-YEARLY REPORT.

The sixty-eighth half-yearly report of the Executive Council was submitted as follows: 2. Membership.—The Federation comprises the following county Federations:—Northern Counties, Lancashire, Cheshire and North Wales, Yorkshire, Midland Centre, London, Southern Counties, Eastern Counties, South-Western Counties, and South Wales, together with the Dublin Building Trades Association, the Belfast Association, and as Colonial members, the South African Federation. The Scottish Federation are honorary members. There has been a further increase in the membership. The total number of local Associations affiliated is now 154, with an aggregate membership of about 6,222.

The Federation is affiliated to the International Federation of Building and Public Works Contractors, with headquarters at Brussels. Further particulars are to be found in the "N-F-Record" for June.

3. State of Trade: Continues to improve. Unemployment is low, and there is some apprehension that there will be a shortage of labour should the trade get busy; this is believed to be due partly to the demands of other industries, and partly to the considerable emigration which has been going on for some years past.

So far as the demands of other industries are concerned, there are signs that the trade boom in the iron, coal, and shipbuilding industries is ending, and a slump may be expected soon. This will set free some labour and relieve the building trade.

4. Boards of Conciliation.—The National Board has held six meetings, at which the following appeals and other matters were considered:—

The notice of the Operative Society of Bricklayers to terminate its membership of the Conciliation Scheme expired on May 1; it is understood, however, that recent amendments of the rules in the direction of speeding-up procedure have met the objections which caused the withdrawal, and that there is a prospect of a further vote being taken with the object of re-adhering to the scheme. At the annual meeting of the Board in March, the carpenters and joiners of Nottingham appealed for an advance of 1d. per hour and an alteration of the walking-time rule. An advance of 3d. per hour to 10d. was granted, the walking-time rule to remain unaltered. Various alterations of the rules were agreed to for the purpose of ensuring more prompt action, and it was decided to call the attention of those unions which remain outside the scheme to the improvements and to the number of settle-

ments effected by the Board. There have been a number of favourable replies received in respect to the proposed conference on Standing Joint Demarcation Committees, and it is hoped to arrange for a meeting in the autumn. Having regard to the events which brought about the London dispute and to the assurances of the union representatives on the Board that their Executives were agreed on the necessity for the strict observance of agreements entered into between employers and workmen, the Board decided to offer its services to the disputants. These were accepted with a reservation which limited the Board to recommendations, and by a suggestion by representatives from the London Master Builders' Association, and certain operative unions whose members are involved in the dispute. A conference was first held, at which both parties fully stated their case, after which the Board recommended that an undertaking or guarantee of the local working rule agreements by the general unions, whose branches had entered into them, should be deemed a sufficient guarantee for their observance, and that London should come under the Conciliation Scheme. The recommendation was accepted entirely by one party and conditionally by the other, and at a further conference the Augmented Board made detailed recommendations for the settlement of the dispute. These were accepted by one party and rejected by the other. As no settlement had been arrived at when the quarterly meeting of the Board was held on June 8, a deputation from the Executives of ten general unions whose members are involved in the dispute came before the Board with suggestions for a settlement, and the Board reported them to a meeting of the E.C. of this Federation the same day, as a result of which further negotiations took place, as elsewhere reported. Meanwhile the Board adjourned until June 19, when it was reported that the recent negotiations had failed to effect a settlement, whereupon the Board recommended the parties to refer the matters in dispute to the final decision of some third party. The carpenters and joiners of Leicester appealed for an advance in wages of 1d. per hour, the employers counter-claimed the abolition of walking-time. The Board granted an advance of a halfpenny and the abolition asked for. The joiners, bricklayers, and builders' labourers of Leamington appealed for an advance of 1d. per hour in wages, and an adjustment of the overtime rule. The Board granted an advance of a halfpenny and altered the overtime rule to time and a quarter for first two hours and time and a half afterwards. The National Joint Committee of Appeal has held four meetings, at which the following appeals and other matters were considered. The Doncaster operatives appealed against a refusal of the employers to sign the rules as settled at a previous hearing. It turned out that this was the result of a misunderstanding. The Board confirmed its previous decision as to overtime, with a qualification for jobs outside the four mile radius. The Colwyn Bay operatives appealed for an advance from 8d. to 9d. per hour in wages. The Board granted an advance of a halfpenny as from December 1, 1914. The Accrington operatives appealed on a question of the non observance of a certain local rule by members of the Master Builders' Association. The Board decided that the latter were not parties to the rules, and therefore had not violated them. The Manchester employers appealed against a refusal by the operatives to fix ceiling slabs made by a certain firm from Burton-on-Trent. The decision was in favour of the contention of the operatives, who relied upon the demarcation rule in force in Manchester. The Nottingham operatives appealed in respect of certain defaulters who had promised to join their union, and whom the employers now alleged were exempt in their capacity as foremen. The Board decided that a man regularly employed as a foreman, whether using the tools or not, has the option of either being a member of the Operatives' Union or not; but where a man has left his society in debt, he must pay up

his arrears or he may be deemed an objectionable. The Aberdare operatives appealed for an advance of a halfpenny per hour; 9d. to 9½d. The Board granted a halfpenny as from January 1, 1915, and fixed a period of two years for the decision to endure. The Newcastle-on-Tyne operatives appealed for an advance of a halfpenny per hour; 10d. to 10½d. The Board granted an advance of a halfpenny as from January 1, 1915. At the annual meeting the operatives reported that there was a desire expressed by their members to be granted the same privilege to contract themselves locally out of the National Agreement as had been assumed by London. The opinion of the Board was that it would be much better that London should come into the scheme. The Leeds operatives appealed for an advance from 9½d. to 10½d. per hour. The Board granted a halfpenny per hour advance as from May 1, 1914, the boundary rule to be made to agree with the one now in force with the plasterers' labourers. The ever-time rule to be altered to time and a quarter for the first two hours. Decision to endure two years. The Coventry operatives appealed for an advance of wages from 9½d. to 11d. per hour, a reduction of the working hours, and alterations of the walking time overtime, and latting rules. The Board granted an advance of ½d. per hour from January 1, 1915, and dealt with the other points raised. The Hereford operatives appealed for an advance from 8d. to 9d. per hour in wages. The Board granted an advance of a halfpenny per hour as from July 1, 1914. The Malvern operatives appealed for a similar advance and received a similar decision. The York operatives appealed for an advance of wages from 9½d. to 10½d. per hour, and for a revocation of the boundary rules as decided by the Board last year, when an advance of ½d. had been also granted. The Board decided that the wages and rules must remain as at present. Appeals from Birkenhead, Huddersfield, Swansea, and Southport were withdrawn, having been settled locally meanwhile.

5. Forms of Contract and Sub-Contract.—During the half-year the negotiations in regard to these have been in the hands of the Institute of Builders, which has tried to press matters forward, and it is hoped will be able soon to report favourably of the progress made.

6. Finance Act Valuations.—The provisions for relieving the building trade of the liabilities imposed upon it by the Finance Act, 1909-10, which were lost last year by the withdrawal of the Revenue Bill, have been reintroduced in the Revenue Bill for the current year. The deputation which had the matter in hand before has examined the new bill, and will report to the E.C. The committee has received valuable assistance from the officials of the E.P.C. in this connection.

7. Priced Schedules with Tenders.—A demand for priced schedules with tenders having been made by a committee of the St. Helens corporation, the matter was taken up both by the Lancashire and Cheshire Federation and the National, and after some correspondence an opportunity was afforded for an interview by deputation with the committee in question, and it is hoped the corporation will now fall into line with the general practice.

8. Strikes.—The labour unrest still prevails to a considerable extent, and its results would have been probably more in evidence than they are but for the safety valve afforded by the conciliation arrangements in force for dealing with claims which, unless dealt with promptly, are a fertile source of dispute. The London dispute has lasted twenty four weeks, and was fully reported on in the June issue of the "Record." Upon the decision of the National Federation to take a vote for a lock out becoming known, the operatives' unions at once met and resolved to individually approach the employers and try to negotiate a settlement. The masons and crane drivers at once did so, and negotiations have been proceeding since, with the result that settlements have been effected with the masons, crane drivers, and wood working machinists. A strike has pre-

vailed for some time at Coventry, due mainly to the same kind of syndicalist activity which caused the trouble in Dublin and London, and a lock-out occurred in Darlington, because the operatives broke the local working rule agreement by striking against the employment of non-union men. The employers in each case have maintained their position successfully.

9. Conference of Secretaries.—It is proposed to hold a conference of the Secretaries of the Federation in October next. Suggestions for the agenda and promises of contributions are desired.

10. Publicity.—Owing to the London dispute the building trade has obtained an unusual amount of attention from both the daily and technical Press. The Committee has also sanctioned the publication of additional literature for organisation purposes, obtainable through the Secretary.

11. The Measurement of Ferro-Concrete.—The Concrete Institute has undertaken, in conjunction with the Quantity Surveyors' Association, to try to standardise the method of measuring ferro-concrete. The opportunity was availed of to have the proposals considered by a joint committee representing this Federation and the Institute of Builders, and in the result some useful suggestions were made to send forward to the Concrete Institute.

12. The National Insurance Act (Part II.)—The Board of Trade having decided that certain amendments were needed in this Act to overcome administrative difficulties which had revealed themselves in practice, consulted with representatives of the industries concerned, ourselves among the rest. The most important changes for employers in the Amending Act are: The simplification of the conditions for a refund to employers, under Section 94. The time for making application is made two months after the termination of an insurance year, and the refund is a fixed amount of 3s. for each workman in respect of whom the employer has paid forty-five contributions during the insurance year; there is no need now for the employment to be continuous, as hitherto. The re-vesting of the provision in Section 96 for return of contributions where short time is worked. The provision as to refund in the Act is substituted by a provision for exemption of employer and workman from payment of contributions under certain conditions of short-time working. The passage of the Bill through Parliament is being watched, as attempts are being made to require indentured apprentices to be insured, and to weaken the safeguards contained in the clause which disqualifies for benefit those unemployed in consequence of a trade dispute at the works, etc., where they were employed when the dispute arose.

13. Organisation.—The following new associations are reported as having joined the Yorkshire Federation—viz., Spen Valley and Mirfield Master Masons, Normanton and Wombwell and District.

Mr. Cook (Preston) called attention to the lack of apprentices in the building trade. In the North it was almost impossible to get a proper supply of apprentices, for parents seemed to have no regard for the future career of their boys, preferring to take a few extra shillings a week they were able to earn in employment for which no apprenticeship was required.

Mr. John Lloyd (Neath) said the present labour troubles were nothing to be compared with the difficulties master builders would have to face when they found a dearth of skilled workmen in the near future, owing to the present lack of apprentices.

Mr. Renshaw (London) said it was shown, after the Census of 1901, that the proper proportion of boys who ought to have entered the building trade as apprentices was 2,500, while the actual number apprenticed was only 500. He had no doubt that the position to-day was still worse.

Mr. Taylor (Bradford) said they would never get over the difficulty until they paid apprentices better wages than at present. The day had long gone by for paying boys 5s. a week and advancing them a shilling every one or two years.

After further discussion, it was decided, on the proposition of Mr. Cook, to add a paragraph to the report urging Federations and Associations and individual firms to give the question of increased apprenticeship their most serious consideration, with a view to supplying the reasonable requirements of the trade.

The remainder of the conference was occupied in private discussion of tactics in dealing with the lock-out question, all the other questions on the agenda being relegated to the next meeting of the Federation in London.

Later in the day the delegates visited Cardiff Castle, at the invitation of the Marquis of Bute, and on Thursday they made a cross-channel trip to Ilfracombe.

THE ANNUAL DINNER.

On Tuesday night the delegates were entertained at the Royal Hotel by the Cardiff Master Builders' Association, whose president (Mr. J. E. Turner) occupied the chair.

Mr. F. G. Rice, president of the Institute of Builders, proposed the toast of "The Lord Mayor and City of Cardiff." In a humorous speech he referred to a sentence in the programme prepared in connection with the visit of the Federation, in which it was stated that the municipal enterprise of the city of Cardiff was "alarming." Personally, he thought the more suitable word was "charming." (Applause.)

Sir John Courtis, in the unavoidable absence of the Lord Mayor, said he could assure the visitors that there was no piracy in Cardiff to-day. The pirates came from without, and one of the things stolen from Wales was a great share of its pure water-supply. (Laughter.)

Mr. W. Lawrence, jun., President of the London Master Builders' Association, proposed the toast of "The Architects, Surveyors, and Engineers." He hoped that in the event of a lock-out, the architects in the provinces would not insist on the carrying out of contracts. (Hear, hear.)

Mr. H. Teatler, F.R.I.B.A., Cardiff, responding, said that it might be desirable to give all jobs to members of the Federation, but it would hardly work in Glamorgan, where the principal work was done by the county council or the corporation, who insisted on the lowest tenders being accepted.

Mr. C. H. Priestley, the Cardiff City water-works engineer, also responded.

Sir John Courtis proposed "The National Federation of Building Trades Employers of Great Britain and Ireland." In view of recent events, he said, it behoved every employer of labour to identify himself with an organisation similar to the Federation. The time had come when employers would have to stand shoulder to shoulder to deal with the matters put forward by the employees. In London the master builders had exercised commendable patience in the dispute now pending, and they deserved the support of all right-thinking men. Every year increasing demands were made on the employers, and it was only by organising that they could protect themselves. (Applause.) Sir John congratulated Mr. William Thomas on his election as President of the Federation, and coupled his name with the toast.

The President of the Federation, in replying, said the main object of a Federation of that kind was to safeguard the interests of its members and to protect them against attack, and, by being strong, to secure peaceful relations with other organised bodies, and, in particular, with the organisations of the workmen. To this end they had fostered the creation of conciliation boards representative of employers and operatives, and provided the machinery for the adjustment, as far as practicable, of disputes which might arise between them. That machinery had been of incalculable benefit to both sides during the ten years it had been in existence. It had prevented many disputes from becoming strikes, and it had brought about better relations between the executives of some of the general unions of operatives than had subsisted formerly. He thought that those executives understood that there was no hostility on the part of the Federation to trade unionism, so long as it was developed

with regard to the rights of others and with scrupulous respect for, and observance of, agreements duly entered into with our branches.

Unfortunately, as you are aware (continued the President), a number of trade-unions in London have seen fit to break away from their working-rule agreements, and violate them so seriously as to compel the London employers to take action, and which has, in turn, induced the Executive Council of this Federation to take the serious step to-day of sending an ultimatum to the executives of those general unions whose London branches still remain obdurate. Authority to do this has been conferred upon our Executive by a vote of the whole of our membership, when the vote in favour of a lock-out was

7,319 for, 1,739 against.

(Loud cheers.) This grave step has only been taken after every means of negotiation has been tried, and every effort made to secure a settlement by consent. The London employers have willingly complied with every suggestion made to them, with a view to facilitate a settlement, and settlements with some of the trades have been effected. It is now necessary that those still outstanding should accept similar terms. (Applause.)

I can only express the hope that in the action we have taken to-day, solely in defence of the principle that agreements duly entered into must be honourably lived up to, we may enjoy your support and that of the public at large. (Cheers.)

Mr. G. Macfarlane, J.P. (Manchester), proposed the toast of "The Cardiff Master Builders' Association."

The chairman, replying, said that the local association was delighted to have the pleasure of entertaining the National Federation Association representatives. It was an extraordinary fact that on the last occasion when the National Federation visited Cardiff they had also to vote on the question of a national lock-out, and the idea might go abroad that the air of Cardiff had something to do with the fostering of that kind of feeling between employer and employed. He could, however, assure them that such an idea was quite erroneous, because the ballot on each occasion had to do with matters antecedent to their Cardiff meetings. (Hear, hear.) At the same time, he might remind them that the Cardiff Master Builders' Association were not strangers to labour disputes, for he remembered the time when not a single mason's operative would work for a Cardiff master builder for a period of fifteen months. It took them seven years to come to an agreement with the masons' operatives, and during that time the masters had to import men from nearly every part of the Continent, and had to accommodate them with beds on the canal wharf. That dispute was disastrous to all parties concerned, and he hoped that the present trouble would soon adjust itself. (Applause.)

Mr. E. Griffiths (vice-president of the Cardiff Master Builders' Association) proposed the toast of "Our Guests," to which Mr. W. L. Yorath, Cardiff city coroner, Mr. F. Van Opem, Belgium, and Mr. Carr, South Africa, responded.

A new lounge and other improvements have just been carried out at the Hotel Metropole, Whitby. The structural alterations were executed by Messrs. J. Brain and Sons, of that town.

A large block of drug warehouses is about to be built at Old Trafford, Manchester, for Messrs. Boots. The premises will be five stories in height, and the main frontage will extend to thirty bays by a depth of six bays. Messrs. Bromley and Watkins, of Prudential-buildings, Nottingham, are the architects.

The Peter Lyall and Sons Construction Company, Limited, of Montreal, have been awarded the largest building contract ever given out in Canada—that of the Grand Trunk and Canadian Pacific Railways Union Station at Toronto. The competition was particularly keen, tenders being sent in by some of the principal building firms in Canada and the United States. The amount of the accepted tender is between three and four million dollars. The architects of the railway-station are Messrs. Ross and Macdonald and Hugh G. Jones, of Toronto.

Corrente Calamo.

At the half-yearly general meeting of the National Federation of Building Trades Employers of Great Britain and Ireland, at Cardiff on Wednesday, our special report of which appears on another page, it was decided that the national lock-out of all men engaged in the building trades should commence on August 15, unless the London dispute is brought to an end. It was reported that there was a majority in favour of this step of 5,580. That majority is very much more than the necessary two-thirds, and should convince all reasonable trade-unionists that the employers throughout the country are in earnest, and that their action is endorsed by all the subsidiary trades. There are some signs that this is recognised. As we stated last week, the plumbers had practically effected a settlement; but were holding back for a few days before signing the agreement in the hope that a joint settlement would be reached. The four labourers' unions met this week for the purpose of drawing up a scheme of settlement. The bricklayers, plasterers, and the carpenters and joiners have been waiting until a national lock-out was declared, hoping that the Parliamentary Committee of the Trade Union Congress will take up the matter and call a conference.

We are now in the seventh month of the London dispute, and the loss to the men in wages, levies, and out-of-work benefit is considerably over a couple of millions sterling, all of which has been simply thrown into the gutter, against the thrice-expressed recommendations of the officers of the men's responsible unions, at the instigation of the small, but mischievous, group of Syndicalists who are seeking to "federate" the unions, to serve their own purpose. It is not likely that the employers will endure any longer the provision of means to protract the struggle furnished by the levies on the men at work in London and the provinces. On the other hand, the majority of the men, especially in the provinces, are sick of contributing to the support of men in London who are needlessly idle. In one society sixty-nine provincial branches have passed resolutions protesting against further levies to keep London men out of work against the advice of their own union officials, and the national executive of the union has sent out ballot papers to all its members to say "Yes" or "No," whether the dispute shall be longer recognised. If a majority returns negative replies, those who remain on strike will receive no benefits, and other unions will quickly follow the example by taking a similar ballot of all their members. In view of all these facts the ultimatum of the National Federation of Building Trades Employers is the one means left to bring matters to an issue, and we are glad it has been proclaimed. It will be bad to be all idle together; but it will be better than struggling on to keep things going mainly for the benefit of a lazy minority, who are living on the subsidies of their fellow-workers, and suicidally playing into the hands of those who are straining every nerve to kill genuine Trade-Unionism and substitute Syndicalism in its stead.

The Government Housing Bill is a fraud. The provision of houses for the workmen at

Rosyth is obviously all that is wanted. It was read a second time last Friday; but the big batch of amendments handed in directly after will make its progress through Committee neither rapid nor easy. Sir Arthur Boscawen and Mr. Weigall each handed in an instruction to the Committee to divide the measure into two parts, one dealing with the agricultural districts and the other with what is roughly called the Rosyth question, and to report this second part first to the House. Mr. Worthington Evans, Mr. Charles Bathurst, Mr. Hills, Lord Alexander Thynne, Mr. Stanier, Sir Randolph Baker, Mr. Weigall, and Sir Arthur Boscawen also tabled a number of amendments with the object of subjecting the operations of the Board of Agriculture to the supervision, in a certain degree, of the local authorities. Another change proposed is the substitution of the Local Government Board for the Board of Agriculture. A third batch of amendments would restrict the operations of the Central Department to cases where there is a local demand for housing accommodation, expressed through the local authorities and confirmed by public inquiry conducted in the district. If Ministers want to promote the building of houses, the best thing they can do would be to restore a feeling of confidence and security among those whose business it was till the policy of the Government brought them almost to ruin. Besides, as Mr. Prothero, the new member for Oxford University, estimates, 40,000 cottages built for agricultural labourers are now occupied by persons in the employment of the Government and local authorities, and these should, and might, be set free for the use of the class of men for whom they were originally intended. What advantage, moreover, will the agricultural labourer with a family get out of the rise in wages promised by the Government if he has to pay 3s. 6d. or 4s. instead of 1s. or 1s. 6d. a week in rent? And why are the claims of the town worker—who has been hit hardest of all—to be relegated to the Greek Kalends?

The "Great Budget" is always with us. Hardly a day passes but one case or another comes before the Courts. Whatever harm this masterpiece of muddling has done to the community, it has indeed been good for the lawyers! The latest judgment is that of the House of Lords, confirming the Court of Appeal's reversal of the view of Mr. Justice Horridge about Reversion Duty. In regard to the reversion of land upon the determination of a lease, the Act provides that a duty of 10 per cent. shall be paid upon the difference between the total value of the land at the beginning and at the end of the term granted. It is also declared that, beyond the rent reserved in the lease, all "payments in consideration of the lease" are to be reckoned in arriving at its original value. In this case the lessee had agreed to, and did, expend £6,000 on erecting houses upon the land. Yet the Referee and the Judge would only allow the capitalisation of the rents to be the original value of the land leased. The Court of Appeal, and now the Lords, fortunately reversed this strange ruling, and hold that the £6,000 expended by the lessee on building must come in. So the Crown's view of the value of the reversion on which duty was chargeable had to be much cut down. Any man of business would say at once that to leave out this payment in getting at the original value of the lease was as absurd as it was unjust.

The City of Bristol Health Committee, as will be seen from a report elsewhere, determined last week to recommend a capital expenditure of nearly fifty thousand pounds in the building of houses in Bedminster and in the vicinity of Stapleton-road. It is made clear that this represents only the beginning of the policy of construction. It is asserted that there is a great shortage of good houses at low rentals in Bristol at present, and consequently a large amount of overcrowding. Private enterprise has, it is contended, not been equal to the necessities of the situation, and that is one reason why the committee has decided to recommend the council to take a definite step. However that may be, we are sure private enterprise will be stimulated by a decision arrived at simultaneously to relax the building regulations with regard to parapets on houses under 35ft. in height, as requested more than ten years since by the Bristol Society of Architects. Bristol, it seems, is able to do this without going to Parliament. It goes without saying, we take it for granted, that as the chairman and the city engineer pointed out, private builders will be allowed to do what the city is going to do with regard to its own buildings.

The proposal of the Special Electricity Committee of the L.C.C. to promote a Bill in the next Session of Parliament to establish a new undertaking and a new authority for the purpose of controlling the electric-lighting of London, which would actually be carried out by a private company, is a compromise, of course; but it has features which deserve careful consideration. No one can deny that the present system is chaos, with over seventy authorities engaged in supplying in the Metropolitan area from sixty generating stations on nearly fifty different systems. There is no real competition: some of the authorities are alive to public needs, some are not. If the L.C.C. scheme succeeds the public will be safeguarded by owning the greater part of the capital and receiving the greater part of the profits. Whether, on the other hand, commercial management and rapid development in the interests of the consumer will be insured by the placing of the operations of the concern in the hands of a private body, even under strict municipal control, we are not yet sure. If that really can be achieved, it may be that the principle will be extended by-and-by in other directions, and we may see municipal control and private enterprise not hostile, but working amicably together, as they might, for the common benefit.

A sensible decision was given with reference to cremation at the Liverpool Consistory Court on Tuesday, when the Rev. Leslie Paterson, vicar of All Saints' Church, Speke, sought permission to construct a chamber beneath the floor of the sanctuary of the church, and to place in the chamber a cinerary casket containing the ashes of his late wife. Chancellor Dowdall granted the faculty; but as petitions of this kind were still rare, and the one dealt with the first in the Liverpool diocese, he made some observations on the case. In 1881 Mr. Justice Stephen determined that cremation was not a criminal offence, unless its object was to avoid a coroner's inquest or carried out in such a way as to be a public nuisance. In 1894 Chancellor Tristram decided that although cremation was not contemplated by ecclesiastical law, it was not contrary to that law, and this decision had never been

disputed. Interments in churches, although common until the middle of the last century, were now very generally prohibited on sanitary grounds. Mr. Asquith, when Home Secretary, ascertained that the Church Building Act of 1818, the Public Health Act of 1874, and the Burial Act of 1853 did not apply to the burial of ashes within a church, which was, therefore, lawful even in those cases where the burial of a body would be unlawful. That, of course, is so, and it should be borne in mind by all who prefer the safe and reverent custody of the remains of their near and dear ones, to the chances and changes of the overcrowded cemetery.

Architects bothered with echoes and reverberations in auditoriums will be interested in Bulletin No. 29 of the University of Illinois, obtainable in this country of Messrs. Chapman and Hall, Henrietta-street, Covent Garden, price 20 cents. The auditorium of the University of Illinois seems to have furnished a particularly tough acoustical problem. The building is shaped nearly like a hemisphere, with several large arches and recesses to break up the regularity of its inner surface. The original plans of the architect were curtailed because of insufficient money appropriated for the construction. The interior of the hall, therefore, was built absolutely plain, with almost no breaking up of the large, smooth wall surfaces; and, at first, there were no furnishings except the seats and the coco matting in the aisles. The acoustical properties proved to be very unsatisfactory. A reverberation, or undue prolongation of the sound existed, and, in addition, because of the large size of the room and the form and position of the walls, echoes were set up. If an observer stood on the platform and clapped his hands, a veritable chaos of sound resulted. Echoes were heard from every direction, and reverberations continued for a number of seconds before all was still again. Speakers found their utterances thrown back at them, and auditors all over the house experienced difficulty in understanding what was said. On one occasion the University band played a piece which featured a xylophone solo, with accompaniment by the other instruments. It so happened that the leader heard the echo more strongly than the direct sound, and beat time with it. Players near the xylophone kept time to the direct sound, while those farther away followed the echo. The confusion may well be imagined.

An investigation of the acoustical properties of the auditorium was begun in 1908 and has continued for six years. It was decided at the outset not to use "cut and try" methods of cure, but to attack the problem systematically, so that general principles could be found, if possible, that would apply not only to the case being investigated, but to auditoriums in general. This plan of procedure delayed the solution of the problem, since it became necessary to study the theory of sound and carry out laboratory investigations at the same time that the complex conditions in the auditorium were being considered. The author spent one year of the six abroad studying the theory of acoustics and inspecting various auditoriums. The main echoes in the auditorium were located by means of a new method for tracing the path of sound, the time of reverberation was determined by Sabine's method, and a general diagnosis of the

acoustical defects was made. Hangings and curtains were installed in accordance with the results of the study, so that finally the acoustical properties were improved. The results of the survey show that curved walls are largely responsible for the formation of echoes because they concentrate the reflected sound. It seems desirable, therefore, to emphasise the danger of using such walls unless their action is annulled by absorbing materials or relief-work. Large halls with curved walls are almost sure to have acoustical defects. We note that the report, which is very fully illustrated, attaches little value to the popular ideas that a cure is to be sought by the use of wires and sounding-boards, or that it is of much use for architects to model auditoriums after those already built that have good acoustical properties. It does not follow, it is asserted, that halls so modelled will be successful, since the materials used in construction are not the same year after year. For instance, a few years ago it was the usual custom to put lime-plaster on wooden lath; now it is frequently the practice to put gypsum plaster on metal lath, which forms an entirely different kind of a surface. This latter arrangement makes hard, non-porous walls which absorb but little sound, and thus aggravate the reverberation. Further, a new hall usually is changed somewhat in form from the old one, to suit the ideas of the architect, and it is very likely that the changes will affect the acoustics.

Mr. Samuel Bird has been elected, for the second time, Master of the Tylers' and Bricklayers' Company; Mr. Richard Moreland, jun., Upper Warden; and Mr. H. J. B. Moreland, Renter Warden.

At the Garden Village, Knebworth, on Friday, the Countess of Lytton laid the foundation-stone of a new church, now being erected close to the centre of the village, on a site of one acre, and, when completed, will accommodate seven hundred persons.

The Lyon Memorial Hall at Hodnet, Staffs, was opened last week. It is built of red bricks, with stone dressings, seats in the assembly-room 250 persons, and cost £1,200. Mr. C. E. Davenport, of Hospital-street, Nantwich, was the architect, and Mr. T. S. Gresty, of Willaston, the builder.

A Local Government Board inquiry has been held into an application of the rural district council of Billericay for sanction to a loan of £9,000 for sewerage and sewage-disposal works for the parish of Hutton, near Shenfield. Messrs. Wilcox and Raikes, of Birmingham, are the engineers.

At the meeting on Tuesday of the Surrey County Council at Kingston, the county surveyor (Mr. A. Dryland) reported that the experience of the past year, in which the necessary repairs had been trifling, had confirmed his opinion as to the satisfactory results of the use of tarred slag for main-road surfaces.

The Brighton Town Council have received the sanction of the Local Government Board to a number of loans, including one of £13,700 to buy land adjoining the new Brighton and Sussex Grammar School for a playing-field, and one of £1,500 for the purchase of land as a site for a hostel and playing-field for the women students of the Day Training College.

The executive committee of the City and Guilds of London Institute have appointed Mr. Alfred J. Margetson, B.Sc. (Lond.), M.Sc., at present assistant professor at the City and Guilds (Engineering) College, Kensington, to the Professorship of Civil and Mechanical Engineering at the Technical College, Finsbury, vacated by Professor E. G. Coker, on his appointment to the Chair at the University College.

Two new recreation-grounds in the heart of thickly-populated areas in Birmingham were formally opened to the public on Monday evening. They are situated in Sheepcote-street and George-street West respectively. The total cost of the former is £3,997 5s., comprising site £3 4d. and laying out £557 5s. The open space at George-street West—now to be called the Brookfields Recreation Ground—has cost £6,853 8s., the site accounting for £5,833 8s., and the laying out for £1,020.

FENCED-IN TRAMLINES.

At the closing meeting of the sixth annual Conference of the Tramways and Light Railways Association, held at Newcastle-on-Tyne last week, Mr. J. A. Brodie, engineer to the Liverpool Corporation, read a paper on "Town Planning in Relation to Tramways." He appreciated the importance of the relationship between improved means of conveyance and the development of town areas. Main streets and roads had always been the principal features in old plans of towns, and they must continue to form the real backbone and frame to which details of any effective planning scheme were to be fitted. The success and prosperity of any town depended on its facilities for traffic, and there was little doubt that speedy local passenger transport was likely to play a very important part as effecting the development of town areas in the future. Although about four millions sterling had been expended in Liverpool during the past fifty years, it could safely be said that none of the most important streets in the old part of the town were of width in excess of the present requirements. It was not far from the truth to declare that the new era of road improvement and widening was about to commence. Experience in connection with street improvements near the centre of a town showed that four-fifths of the whole expenditure went in payment for houses and compensations, all of which would have been avoided if ample width for traffic had been originally provided. Ample width was now a matter of the greatest possible importance where general traffic was considerable, and 80ft. should be regarded as the minimum in any thoroughfare leading towards the centre of any considerable community. With regard to tramways, the factor leading to success would be speed. They must go for increased speed, combined with safety for passengers, comfort for occupiers of frontal property, and reasonable economy. The average speed, he suggested, might be increased to twenty miles an hour, and safety provided by fenced lines in wide streets. The question of noise would have to be considered along with speed. Competent engineers would not find the problem of resilient and silent tires incapable of solution.

Alderman Smith, Liverpool, thought it necessary that trams should travel at high speeds, and this demanded wide roads. He did not believe that people would travel in tunnels if they could travel on the surface.

Mr. Stephen Sellon, referring to diagrams presented by Mr. Brodie, asked why he had not contemplated running cars at the side instead of in the roadway?

Mr. Brodie, in reply, said it was safer to run fast cars in the centre of a road, and people occupying houses along the route would be less troubled with noise than if cars were run at the side.

Mr. Harry England observed that cars would be able to maintain a high speed at the side of the roads if they had their own right-of-way.

It was decided unanimously by the Court of Common Council on Tuesday that a bust of the late Mr. Joseph Chamberlain should be executed and placed in the Guildhall.

It is proposed by the London County Council to link up the comparatively little-used line of tramway terminating at Waterloo Station with the Blackfriars-road route and other lines, via New-cut and Great Charlotte-street. The works committee of the Southwark Council in a report issued on Tuesday, offer no objection.

At a meeting of the Staffordshire Education Committee on Saturday, it was reported that plans for the erection of the hostel and farm buildings in connection with the Staffordshire Farm Institute had been submitted to the Board of Agriculture, and that the estimated amount of £23,000, exclusive of cost of land, had been agreed to.

A Local Government Board inquiry was held on Tuesday at Astwood Bank, by Mr. C. H. Eyles, inspector, to consider an application made by the Feckenham Rural District Council for sanction to borrow £1,940 for the purpose of the purchase of land and the erection of working-class dwellings at Astwood Bank. Messrs. Dieks and Waldron, of Evesham, have prepared the plans for the houses.

Building Intelligence.

GALASHIELS.—At a recent meeting of the town council, the burghs building committee reported, in connection with the proposed extension of the burgh buildings and the accommodation for the police department, that the sketch plans submitted to the council in January by Sir Robert S. Lorimer, A.R.S.A., F.R.I.B.A., of Melville-street, Edinburgh, had been forwarded to the Scottish Office, and approved of, so far as the police department was concerned. Thereafter Sir Robert Lorimer prepared completed plans giving effect to a variety of alterations suggested on the sketch plans, and he estimated the cost of the extension at approximately £5,750, with an additional £2,500 for a tower and clock. The completed plans had been approved by the committee, and had been examined by the anonymous gentleman who had been interesting himself in the matter, and he had intimated his desire to bear the expense of the tower and clock. Further subscriptions towards the cost of the extension to the amount in all of £650 had been intimated, while others had been promised. The committee recommended that the completed plans be approved of, and that Sir Robert Lorimer be instructed to prepare specifications and schedules, and thereafter obtain and submit to the council estimates for the execution of the work. The committee's report was adopted.

KINGSWOOD, BRISTOL.—Mr. William Douglas has given a new nursing home to Kingswood, near Bristol. The building is in Hanham-road, and has a frontage of 36ft. and a depth of 40ft.; the elevation is of red brick and Bath stone dressings. To the left of the vestibule is a waiting-room, and behind it are a storeroom, kitchen, and offices. On the right of the vestibule are a committee-room and a dining-room 13ft. 5in. by 22ft. On the floors above are eight bedrooms, two bath-rooms, and a boxroom. The staircase is lighted by a lantern light from the roof. Mr. Thomas Mackay, of Kingswood, is the architect, and Mr. S. Milsom, also of Kingswood, the contractor.

MANCHESTER.—The Central Branch for Accidents and Out-patients of the Manchester Royal Infirmary, which has been built on the site of the Grosvenor-street Chapel and Roby School, Piccadilly, is rapidly approaching completion, and will be ready for occupation in a few weeks. The exterior of the new hospital is plain to a degree, being of red brick, with very little ornamentation. Opening from the entrance-hall are consulting and examination rooms. A special room for accidents is provided, and there are two observation wards, each having two beds. On the ground floor there are also an operating theatre, an X-ray room, and an isolation room. The total number of beds in the institution is fourteen, of which ten are on the first floor, where two wards will have three beds each and two others two beds each. Accommodation is provided for the staff, their sleeping accommodation being on the second floor. Throughout the buildings the floors are of terrazzo, covered by linoleum. The walls in all the patients' departments are tiled, and all corners are rounded. The cost of the building has been £25,000.

NORWICH.—At the last meeting of the city council of Norwich the Special Committee re Flood Protection and Housing reported recommending that tenement dwellings of two stories, self-contained dwellings with three or four bedrooms each, and a few dwellings with two bedrooms be erected in Starling-road, and that a competition be arranged and plans and drawings for the erection of the dwellings be invited from architects resident within seven miles of Norwich who are Fellows, Associates, or Licentiates of the Royal Institute of British Architects, or members of the Society of Architects; three premiums of £20, £15, and £10 respectively be offered, and Councillor Boardman act as assessor on behalf of the committee; and, further, that power be delegated to the Special Committee re Flood

Prevention and Housing to select a plan, and invite tenders for carrying out the work for submission to the council. After a long discussion, and several divisions, an amendment was carried that the city engineer, Mr. A. E. Collins, be instructed to prepare and submit plans and specifications for the work.

NEW CATTON, NORWICH.—The Bishop of Norwich has consecrated at New Catton, a suburb of Norwich, the church of St. Luke's, which has been provided through the generosity of some anonymous donor or donors. The cost of the church approximates to £6,000. It is of red brick, is plain in treatment, and gives accommodation for over 600 people. This most modern of Norwich churches is possessed of a fine Early English font. For years it stood in the garden of St. Andrew's, and has now been handed over to St. Luke's in a state of restoration. The architects of the new church were Sir Arthur Blomfield and Sons, and the builders Messrs. Youngs and Son, of Norwich.

OXFORD.—The Lady-chapel of St. Mary Magdalen Church, Oxford, which has just been dedicated by the Bishop of Oxford after restoration, was built on the site of a chantry erected in the 12th century by the Carmelite Friars. Among its chief features are its massive buttresses with niches to contain figures, and its balustrade. The roof and the balustrade have been restored. The stonework of the four buttresses has been repaired, and in the niches have been placed statues of the Virgin Mary, the prophet Elijah, King Richard I., and Bishop Hugh, of Lincoln. The Virgin and Bishop Hugh were, it is believed, two of the figures which originally filled the niches. King Richard has been chosen because he was born in the Palace of Beaumont, which stood near the church, and the prophet Elijah as the patron saint of the Carmelites.

WHITEKIRK.—The scheme for the restoration of Whitekirk Church, Haddingtonshire, which was burned down by incendiaries in February, has now so far advanced that it has been possible to appoint an architect to prepare plans and obtain estimates. Sir Robert Lorimer, A.R.S.A., F.R.I.B.A., of Edinburgh, has been selected. The funds subscribed and otherwise available are £6,400, but this leaves about £1,600 still to be raised to allow of the complete restoration.

Plans by Mr. Temple Moore, of Hampstead, have been adopted for the new church of St. Augustine to be built in Rock-avenue, Gillingham, near Chatham. The estimated outlay on the first section of the church is £5,500.

Mr. W. M. Cross, M.Inst.C.E., held an inquiry at the Public Hall, Whittlesey, last week, as to the application of the rural district council of Whittlesey to borrow the sum of £2,634 for the erection of working-class dwellings. Mr. Alan W. Ruddle, architect, of Peterborough, produced and explained the plans.

The Evesham rural district council adopted last week a plan prepared by Messrs. Wilcox and Raikes, civil engineers, Birmingham, for connecting Harvington with the village water scheme, by laying a main from Littleton across the River Avon at the Fish and Anchor ford. The estimated cost of this is £2,200. The council is erecting cottages in the village at an estimated cost of £3,400.

Memorial stones of a new Baptist school-chapel were laid last week at the corner of London-road and Vesey-street, Newcastle-under-Lyme. The assembly-hall will be seated for 300 adults, and there will also be three class-rooms. Messrs. George Barnes and Sons, of London, are the architects, and Messrs. Tompkinson and Bettelley, of Longton, Staffs., are the builders. The cost of the present section of the scheme will be £2,100.

A memorial to the musicians who perished in the wreck of the Titanic was unveiled at the headquarters of the National Orchestral Association, Archer-street, Soho, London, last week, by Mr. Landon Ronald. It takes the form of a decorative mantelpiece in one of the club-rooms, with a centre panel executed in bronze showing in relief and figures of Music and Fame. Eight portrait medallions also form part of the memorial. It was executed by Mr. Paul R. Montford, sculptor, with Mr. Maurice E. Webb as architect.

Engineering Notes.

BLYTH.—Large harbour extensions are to be carried out at Blyth. In the upper harbour there will be coaling berths for ships up to 10,000 tons. Staith Jetty will be 1,570ft. long, and there will be a depth alongside of 30ft. at low and 45ft. at high water. The contract has just been placed with Messrs. Mitchell Brothers, Limited, Glasgow. The cost will be borne partly by the Blyth Harbour Commissioners and partly by the North-Eastern Railway Company. A large tidal basin with a deep-water area of 15 acres is being dredged. Future improvements of the harbour consist of the extension of the East Pier by the construction of a monolithic concrete pier 1,120ft. long, the reconstruction and extension of the West Pier, and the provision of basins.

METROPOLITAN WATER BOARD.—This authority accepted on Friday the tender of Messrs. Dick, Kerr, and Co., Ltd., amounting to £673,811, for the construction of reservoirs No. 6 and 7 at Littleton, and incidental works authorised by the Board's New Works Act of last year, and Mr. T. C. Deverell, M.Inst.C.E., was appointed resident engineer at the reservoir works at a salary of £600 per annum, with house rent free. Mr. Deverell was the resident engineer during the construction of the King George reservoir, his salary then being £500 a year. Messrs. S. Wilkes and E. A. Park were promoted in consequence of the retirement through ill health of Mr. Sidney Marsland, the assistant district engineer of the Kent district. It was decided to purchase as a site for filters to be constructed at Hanworth 37½ acres of land of Mr. J. C. G. Pownall at £5,500, or about £145 per acre, and 27½ acres of the Rev. F. Salt at £3,750, or £135 per acre. It was reported that Messrs. Thomas Dockwra and Co. had completed the laying of a 48in. main for the purpose of carrying the unfiltered water of the New River from Southbury-road to Bush Hill basin, and of a 48in. main to carry the water of the New River over Maiden's Brook, authorised by the New River Company's Act of 1896, at a total cost of £9,194, and that the power-station buildings at King George's reservoir had been carried out by Messrs. Charles Wall, Ltd., at an expenditure of £16,180.

SOUTH SHIELDS.—An important scheme of dock extension has been embarked upon by the Middles Docks and Engineering Company, South Shields. The new dock, which will be the largest in Shields Harbour, will be 630ft. long and 80ft. wide at the entrance, with a depth of 26ft. of water over sill. Provision is made in the scheme for the erection of a deep water quay about 750ft. long, which will be fitted with an electric gantry travelling crane. The work will be completed in about two years, and a commencement will be made in the near future with the construction of a second new dry dock. Messrs. Edmund Nuttall and Co., Manchester, are the contractors, and the designs have been prepared by Mr. T. Hanning, M.Inst.C.E., of Newcastle.

At the meeting yesterday (Thursday) afternoon of the City Corporation, a petition to the Local Government Board was sealed for an order sanctioning the Cloth-Fair Improvement Scheme, 1914, pursuant to Part II. of the Housing of the Working Classes Act, 1890, Section 29 (b), as amended by Section 23 of the Housing and Town Planning Act, 1909.

Mr. F. O. Stamford, A.M.I.C.E., Local Government Board Inspector, conducted an inquiry at the Old Grammar School, Ashford, Kent, on Wednesday week into the application of the West Ashford Rural District Council to borrow £3,300 for the purpose of providing proper water supplies in Bethersden, Great Chart, Hothfield, Kingsnorth, and Shadoxhurst.

At a special meeting of Evesham Town Council on Monday, the town clerk reported he had received the formal sanction of the Local Government Board to a loan of £1,800, to be repaid in eighty years, for the purchase of a site in King's-road, for houses for the working classes, and he had made arrangements with the Public Works Loan Commissioners for the loan.

COMPETITIONS.

THE SHAKESPEARE MEMORIAL NATIONAL THEATRE.—We have received the following, in addition to the particulars given in our last two issues: The names of the architects sending in designs, and also their designs, will be seen only by the assessor and the sub-committee. The drawings may be the original working drawings of buildings erected, or they may be elevations of buildings designed but not erected. Not more than five drawings or photographs should be submitted, and not more than two perspectives. A short report of the designs may be included, and also a list of buildings of importance designed or erected. All drawings to be sent in a portfolio on or before September 15, 1914, to the Secretary, the Shakespeare Memorial Committee, 3A, Dean's-yard, Westminster Abbey, S.W.

NEW SCHOOL, SUNDERLAND-ROAD, GATESHEAD.—Members and Licentiates of the Royal Institute of British Architects must not take part in the above competition, because the conditions are not in accordance with the published Regulations of the Royal Institute for Architectural Competitions.

The Herts County Museum, in Hatfield-road, St. Albans, is being enlarged, at an outlay of about £1,500. The builders are Messrs. Salisbury and Son, of Harpenden, and the additional showcases are being made by Mr. J. S. Gibbs, of Fleetville.

The death occurred in Edinburgh on Friday of Mr. David Rutherford, A.R.S.I., for the past half-dozen years chief sanitary inspector for the city. Mr. Rutherford, who had been in failing health for some time, had been in the employment of the Edinburgh Corporation for about twenty years.

The girls' secondary school is in course of erection in St. George's-avenue, Northampton. The school, which is being built by Messrs. Pullen and Sons, is to accommodate 300 pupils, and the cost will be £16,546, exclusive of furnishing, as the laying out of the playing-fields. Messrs. Sharman and Archer, of Wellingborough, are the architects.

Tenders, amounting to £6,088, have been accepted by the West Riding Standing Joint Committee, for the furnishing of the new police headquarters at Wakefield. The total estimate for the building and furnishing, it was stated, was £37,938, and the actual expenditure when completed would be £38,285.

The foundation-stone of the new church of St. Cuthbert, Preston, was laid the other afternoon. The first section of the church to be erected will consist of the chancel, part of the nave, with the vestries, which will cost over £7,000. The architect is Mr. Temple Moore, of London, and the contractors are Messrs. Ullathorne, of Selby.

On Saturday, at Chilcompton, Lady Kathleen Thynne laid the first foundation-stone of a new church house, which is to be erected in the parish. The members of the C.E.M.S. have agreed to carry out the work of erecting the building in their spare time. Mr. H. G. Tovey, of Midsomer Norton, will act as hon. architect, and has prepared plans. Mr. A. G. Target, one of the churchwardens, is the clerk of the works, and hon. treasurer to the scheme.

A Ceylon pavilion has just been added to the public galleries of the Imperial Institute. The scheme of internal decoration is based on Sinhalese designs and colouring. The designs are taken partly from sculptured decoration found on ruined dagobas at Anuradhapura, and partly from Kandyan painted pottery, with the addition of proverbs and sayings written in Sinhalese characters. The exhibits include specimens of Kandyan woodcarving, metal-work, pottery, and painting; also photographs illustrating the tea industry and water-colour sketches and photographs of Ceylon scenery.

A service was held in the partly erected new church of Urr, near Dalbeattie, on Saturday in the course of which a memorial-stone was laid in the chancel. The church, which is estimated to cost £3,000, will be the fourth on or near the present site, the first having been erected in 1606, the second in 1752 and the third in 1815. A panel from the pulpit of the first church, bearing the initials of the then minister, Mr. John Thomson, has been presented and will be fixed to the pulpit of the new building. A stone from the belfry of the church recently demolished, with the figures 1815 on it, is to be built into the new west gable. The architect is Mr. P. Macgregor Chalmers, of Glasgow.

Our Illustrations.

REBUILDING PREMISES IN BISHOPSGATE FOR THE LEATHERSELLERS' COMPANY.

The rebuilding of Nos. 54 to 66, Bishopsgate, is for a bank or insurance premises, with offices over, as shown by the accompanying plans. It will be seen that the

Mr. HOWARD CHATFIELD CLARKE, F.R.I.B.A., Architect.

central feature of the façade is the arching over the existing entrance to St. Helen's-place, which has been included in the design. At present the entrance is through iron gates, the premises being the property of the Leathersellers' Company. As will be seen from the illustrations, the offices are approached from St. Helen's-place, and are planned so as to be easily divisible or dealt with in large areas. Two blocks of offices have already been built in St. Helen's-place, each occupying the site of four of the old houses formerly existing, and the present block is suggested to be carried out on similar lines, the elevation being built wholly in Portland stone. The architect is Mr.

diagonally across an approximately square site, with many aisles diminishing into angles on the north and south sides. The effect should be very interesting, because although the church will be nearly as wide as it is long, its shape brings the sanctuary (and for that matter, the pulpit, too) into view from every part of the church. On account of a loose subsoil and a deep pit already dug on the site (not to mention the want of space on the land at disposal) the vestries and a large clubroom have been arranged for most economically in a basement. The church will seat 600, and the cost is estimated at £7,000 complete. It will be built of brick, with brick facings, stone being used only in the

windows, doorways, etc. The drawing here reproduced is now on view at the Royal Academy. Mr. Temple Moore, F.R.I.B.A., is the architect.

WELLGARTH CORNER, HAMPSTEAD GARDEN SUBURB.

This house overlooks the extension of Hampstead Heath, and is faced externally with Chesham grey sand-faced bricks, the chimney-stacks, quoins, and window-reveals being executed in reds. The porch and

mottled facing-bricks. The towers, east and west wings, will be roughcasted, finished with a rough surface, and distempered. Doulling stone will be employed to upper part of towers. The tile-hanging to lounge, north end, to be bright red sand-faced tiles, contrasting with roof-tiles, which are dark brindled. Roofs to tower and shelter: The floors to shelter and towers, expanded metal and concrete; the framework to shelter will be in light steelwork, cased in concrete, and finished in cement rendering. The moulded

"WELLGARTH CORNER," HAMPSTEAD GARDEN SUBURB.

MR. HERBERT A. WELCH, A.R.I.B.A., Architect.

niche over are executed in Portland stone. The windows are double-hung sashes, and the roof is covered with red sand-faced tiles, with bonnet-shaped hips. The hall is panelled in oak, which has been treated with liquid lime to finish a greyish colour. Elsewhere the joinery is in deal. The architect is Mr. Herbert A. Welch, A.R.I.B.A., 7, New-square, Lincoln's Inn, W.C. The accompanying drawing is now on view at the Royal Academy Exhibition.

EXTENSION TO DOXFORD HALL, NORTHUMBERLAND.

The illustration shows a view of the end of the new wing which has just been added to this mansion. On the ground floor is a library, 56ft. by 25ft., separated from two small rooms by an archway, through which the drive passes. On the first floor are bedrooms. The library interior is finished in mahogany, left untouched from the tool, with special plasterwork to ceiling and beams. The stone used on the building is from a local quarry, and the roof is covered with Westmorland slates. Messrs. Mauchlen and Weightman, of Newcastle-upon-Tyne, are the architects.

HYTHE CONCERT HALL: SELECTED DESIGN.

The requirements of the Hythe Corporation in this competition were to provide a concert-hall, public shelter, and tea-rooms upon the old baths site, which lies between the sea front and South road. In this, the first premiated design, Mr. Arthur Wintle, of 418, Strand, W.C., has arranged the public shelter and tea-rooms facing the sea in such a way that they can be used in conjunction with the concert-hall, which has been placed with its main entrance towards South road. The various divisions are concentrated into one block, with a view to facilitating supervision and reducing the requisite staff to a minimum. The old baths building has been utilised, thus allowing the building as a whole to be planned on a more liberal scale than would otherwise have been possible. The scheme has been divided into three portions: (1) Entrance vestibule and cloak-rooms, etc., fronting upon South road. (2) Concert-hall and gallery. (3) Shelter tea-rooms and balcony. The materials proposed to be used are: Concert-hall, north entrance and chimney-stacks facings, 2in. purple

work to the south elevation will be run in cement, which will be subsequently painted. The concert-hall will have a light steel roof, carried upon cast-iron columns, the lattice girders supporting the clerestory wall being used decoratively. The ceiling to the concert-hall and the proscenium will be constructed of fibrous plaster. Mr. Charles F. A. Voysey was the professional referee who selected this design on behalf of the Hythe Corporation.

A tower is being added to the Roman Catholic Church at Donnybrook, near Dublin. Messrs. W. H. Byrne and Son, of Dublin, are the architects, and Mr. Michael Green, of Donnybrook, is the builder.

The foundation-stone of a church hall was laid on Friday, at Hightown, Sefton, near Liverpool. It will accommodate 200 persons, and is being built from plans by Messrs. Shephard and Bower, of Royal Liver Building, Liverpool.

The Metropolitan Asylums Board have purchased 57 acres of land at Hyde Stile, two miles from Godalming, for the purpose of erecting a tuberculosis sanatorium for women, with accommodation for 200 patients. The land lies at an altitude of nearly 400ft. above sea-level, and is sheltered by the higher hills of Hindhead and the Hog's Back.

In the matter of the application on behalf of William Frederick Russell, temporarily residing at his Majesty's Prison, Wandsworth, lately Queen's Wood-road, Forest Hill, and Hollingbourne-road, Herne Hill, formerly Alscot-road, Bermondsey, builder's foreman, formerly master builder, the order of discharge has been suspended for two years.

A municipal secondary school for boys in Leaf-square, Pendleton, Salford, was opened on Thursday in last week by Sir William Mather. In the twelve classrooms of the school there are places for 330. There are also three laboratories (two chemical and one physical), an art-room, manual-instruction room, gymnasium, library, dining-room, and kitchen, head and assistant masters' rooms, and an assembly-hall. The cost for building was £20,000.

The old tower of the Royal University in Earlsfort-terrace, Dublin, which dates from 1884, and is in course of demolition in consequence of the erection of new buildings for University College on its site, is to be re-erected by H.M. Board of Works at the rear of the new College of Science adjoining Kildare-place, by Messrs. G. and T. Crampton, contractors, of Ballsbridge, Dublin, who are also the builders of the new University College, which is being constructed from plans by Messrs. Doolin and Butler, of Dublin.

LEGAL INTELLIGENCE.

PARKER - STREET AND KINGSWAY FRONTAGES.—On three days this week Mr. John Hubert Oakley, of the firm of Messrs. Daniel Smith, Son, and Oakley, sat at the Surveyors' Institution as arbitrator in a compensation claim in respect of two of the three interests in a site in Parker-street, that of Mr. Wheatner and that of Mr. Delissa Joseph. The witnesses for the claimants include Sir David Burnett (Messrs. Fox, Burnett, and Baddeley), Mr. B. I. Breach (Messrs. Farebrother, Ellis, and Co.), Mr. W. Hurst Flint (Messrs. Humbert and Flint), Mr. J. H. Townsend Green (Messrs. Weatherall and Green), Mr. James Boyton (Messrs. Elliott, Son, and Boyton), and Sir Alexander Stenning. For the Holborn Borough Council there were called Mr. H. Chatfield Clarke, P.S.I.; Mr. Leslie Vigors; and Mr. Howard Martin (Messrs. Thurgood and Martin). The Holborn Borough Council, under Michael Angelo Taylor's Act, sought to acquire a strip of the frontage of the site for the widening of Parker-street. The loss of the strip would, it is alleged, do away with the Kingsway frontage. The arbitrator announced on Wednesday afternoon that he should reserve his award.

A CRUCIFIX IN A MEMORIAL WINDOW TO AN ARCHITECT.—The Chancellor of Durham (Dr. P. V. Smith) held a Consistory Court on Friday at St. Oswald's Church, Durham, for the purpose of hearing an application by the vicar and churchwardens of the parish for a faculty to confirm the insertion of a stained-glass window in memory of the late Mr. C. Hodgson Fowler, P.S.A., F.R.I.B.A., for many years architect to the Dean and Chapter of Durham. Mr. E. Laidler stated that the window was a gift by Mrs. Hodgson Fowler, and that there was no opposition. The Chancellor, giving judgment, said the window was of two lights, with representations of Bishop Hugh of Lincoln and St. Paul of Rochester. In a lower space there was a figure of Mr. Hodgson Fowler, kneeling and presenting the ground plan of the church, and there was a crucifix at the side. The window had been put up without a previous faculty, which was an unfortunate thing. He felt it was impossible to grant a faculty for a window containing such a representation without holding a Court to consider the matter and seeing the actual window itself. It was well known that before the Reformation the crucifix and other images were used in connection with Divine worship. All that was swept away at the Reformation on the ground that it led to superstition. It was hardly 40 years since the Privy Council gave a decision that figures of historic representation might be allowed, but the objection to figures in a church was confined to cases in which there was a risk of their being the subject of superstitious reference or abuse. Since that time the introduction of historic sculptures had become extremely common, and there were more and more of them every day. Simultaneously with that, there had been attempts made to introduce the crucifix in churches, and decisions given in 1901 and 1906 on the subject clearly defined what was legal and what was illegal. The Chancellor said that the window itself, he considered, had not the figure of a man engaged in prayer, but a figure of the late Mr. Fowler holding in his hand the plan of a church, which he was presenting before God. If that were done before the crucifix, he thought the objection might prevail. He thought they might take it that the crucifix was there, but that it did not form part of his actual devotional act. That being so, he was prepared to grant the confirmatory faculty.

The Stepney Borough Council have decided to purchase a site in Arbour-street, at £11,000 for the erection of municipal buildings.

Mr. A. B. Blaschek has been appointed successor to Mr. Leese as deputy surveyor of the Forest of Dean, and director of the proposed forestry demonstration area there.

Mr. I. J. Williams, for the past four years curator of the Corporation Art Gallery and Museum at Cyfarthfa Castle, Merthyr Tydfil, has been appointed Director of the Art Gallery of the National Museum of Wales. Mr. Isaac J. Williams was for fifteen years art instructor under the Merthyr Corporation, and was especially identified with art and handicrafts.

The Pottery's Fund Committee, the object of which is the discovery and assistance of women and girls suffering from lead poisoning, states in its report for 1913 general willingness to comply with the voluminous new code of regulations issued last year has been noticeable, and in some cases abandonment of the use of lead has been an indirect result of their enforcement. For example, Messrs. Doullton, in the Potteries, now employ a glaze which is harmless for all their white china.

PROFESSIONAL AND TRADE SOCIETIES.

ANTIQUARIES AT NEWMINSTER.—The other afternoon, there was a meeting of the Newcastle-on-Tyne Society of Antiquaries on the site of Newminster Abbey, near Morpeth. The party was received by Mr. George Renwick, Springhill, owner of the Abbey grounds, an examination of whose recent excavations was the main object of the visit. Mr. Joseph Oswald explained to members that Newminster was founded in 1138, by Ranulph de Mereley of Morpeth, that its chartulary was edited by Canon Fowler, and published by the Surtees Society, and that it met the fate of all similar establishments in this country in 1539. Mr. Renwick by his arduous work had made many important discoveries since the society was there a year ago. One of these was the base, seven feet square, of a massive pier, which was Late Transitional or of later date, about 1200. That pillar stood between two of the three chapels on the east side of the south transept. Of such chapels there had been six in all. By means of the pillars which separate these chapels, and other remains, they were able to lay out the outline of that part of the church, which was found to follow the traditional Cistercian plan. Mr. Renwick had cleared out the great accumulation of soil and debris from the cloister garth, and by the beautiful pieces of arcading he had erected with the carved stones saved out of it, had given visitors a good idea of the extent of the cloisters and their ambulatories. Several interments of exceptional interest had recently been found. One of these had its covering almost perfect, and its Latin inscription set forth that it was the burial place of Johanna, the Lady of Stanton (a property five miles west of Newminster), the wife of W. Corbett. He, Sir Walter Corbett, a Shropshire man, lies in an undisturbed grave by her side.

THE EDINBURGH ARCHITECTURAL ASSOCIATION.—Through the generosity of Sir R. Rowand Anderson two special prizes of £40 each have just been awarded by the Edinburgh Architectural Association. The prizes were offered for the encouragement of the study of the development of steel construction, more particularly as exemplified in the work of France and Germany, and were open to any two members of the architectural profession in Scotland, over twenty-one and not over thirty years of age, whom a special committee appointed by the council of the Edinburgh Architectural Association should deem most suitable for prosecuting this special study. The prizes have been awarded to Mr. William Paterson, A.R.I.B.A. (Pugin Student 1913), of Edinburgh, and Mr. James McLaren Brown, of Hamilton, N.B., who will be required to spend not less than eight weeks studying on the Continent.

THE NATIONAL SOCIETY OF ART MASTERS.—The annual meeting of the National Society of Art Masters was held on Friday at the Victoria and Albert Museum. Mr. H. Schroder, the retiring President, delivered an address, remarking on the importance of a definite policy as to the future of art education, and deploring the general failure to grapple with its present-day problems on the part of those concerned in the administration of schools. As to current reforms, the scheme for superannuation of teachers in secondary schools was practically an accomplished fact, and only awaited the legislation promised by the Chancellor of the Exchequer. The council had gone ahead with a scheme of examinations for course certificates after full discussion with the Board of Education. These certificates would insure that anyone obtaining them had passed through a course that was consistent and educationally sound for his particular work. A drawing certificate for teachers in elementary schools had been established this year. With regard to secondary teachers, a definite step had been taken that would help to establish the Society as the chief art-teaching body in the country. He had been enabled to safeguard the Society and Schools of Art, provision having been made for repre-

sentatives of the Society to be on the advisory board connected with the certificate. They had now to deal with an entirely new problem—handicraft and manufacture, and not art, taking the predominant place, and the school that turned out an inordinate number of art class teachers and art masters simply because it had a course of work already to hand was a thing of the past. The report, which was adopted on the motion of the President, stated that the examinations for the drawing certificate had been very successful. The number of full members—392—showed an increase of twenty on last year. The question of grants to schools of art was discussed, the President moving that the meeting express regret at the action of the Board of Education in reducing the grant to small schools.—Mr. Parkinson pointed out that the small schools supplied many students to large schools, and to cut out the small schools would be to limit the supply.—Mr. Bedford urged that the question was one of life or death to the small schools, which the Board was starving out of existence. The resolution was carried. Another resolution, also moved by the President and carried, urged the Board of Education to make grants to districts in relation to the all-round educational facilities which local authorities offered. The annual dinner of the Society was held at the Holborn Restaurant in the evening. Mr. H. Schroder presiding. In replying to the toast of "The Visitors," proposed by Mr. W. B. Dalton, the President-elect, Mr. W. R. Colton, R.A., remarked that in France they dealt with art on a commercial basis, and the art of the country was not the worse. There were two principals to be considered—the producer and the consumer. In England we were worrying and striving to produce the producer of art. We ought also to consider and to endeavour to educate the consumer. It was the training of the nation to a higher appreciation of what was fine in design that would make the country in the future. The official policy today seemed to be to let students, masters, and education authorities have a slack time.—Mr. Frank Warner, who also replied, referred to the great progress of the silk industry, resulting from a more general appreciation of design and colour; this was mainly the result of the work of the art schools. Mr. Alan Cole proposed "Success to the Society of Art Masters," and the President returned thanks.

MANCHESTER ARCHITECTS VISIT BIRMINGHAM.—On Saturday the Birmingham Architectural Association received a visit from the members of the Manchester Architectural Association, who made a tour of the city and inspected some of the architectural features. The new galleries of the Royal Society of Artists in New-street were first visited, and the visitors were much impressed by the galleries and the collection of works contained in them. The magnificent stained-glass windows of the Cathedral by Burne-Jones and Morris were next inspected, and afterwards the party proceeded to the Victoria Law Courts, where the stately entrance-hall and fine woodwork of the courts were admired. The journey was continued to Aston Hall. A number of modern churches, all by Birmingham architects, were visited—viz.: St. Benedict's, St. Gregory's, St. Oswald's, and St. Agatha's. Afterwards the party proceeded to the Red Lion Hotel, King's Heath, for tea, this building being an excellent example of the Cotswold style. From thence the party went to Bournville and viewed the group of buildings round the green. On returning to the city the visitors were entertained to dinner at the Queen's Hotel.

UNIVERSITY COLLEGE.—In connection with the School of Architecture the following awards have been made: Carpenters' Company Travelling Studentship, H. Norman Jepson; Evening Design Class Prizes, F. E. Crutchley and R. A. Walter; Additional Prize for Sketching and Measuring, R. A. Walter.

A return presented by the Corporation states that a net outlay of £11,370 was incurred last year on street paving in the City of London.

Correspondence.

"CAKES AND ALE."

To the Editor of the BUILDING NEWS.

SIR,—Having, not so long ago, to act professionally in connection with a competition of the first importance, I was somewhat depressed by the display of incapacity on the part of those who, as elected representatives of the people, constitute the authority responsible for the choice of the design for the building in question.

When the plans were on view the utmost was made of the occasion, and admission to view became a privileged and exclusive affair, no one being admitted unless armed with a special permit, a janitor in livery being employed to guard the portal, and a policeman in uniform was placed in charge of every room. I was very amused with all this, and particularly with the inane remarks passed upon the designs by those on whose vote the ultimate choice of an extremely costly and conspicuous building scheme depended.

I was not surprised to witness the very inadequate attention given by these guardians of the public purse to the essentials of the project or to hear vulgar designs much belauded; but I thought the climax was reached when one portly and very consequential councillor "took the cake" by remarking, almost immediately after his fussy arrival, on meeting some of his confrères: "I say, you fellows, any sherry and sandwiches?" Finding nothing of the sort going, he left promptly. Fortunately, there was a professional assessor employed in the contest referred to, and I know him well.—I am, etc., F.R.I.B.A.

The Local Government Board have given their sanction to the borrowing by the town council of Bury, Lancs, of £40,720 for extensions at the Chamber Hall electricity power station.

At an adjourned meeting of the Birmingham City Council on Tuesday, the scheme for the extension of Holyoak Asylum was approved on the recommendation of the asylums committee. The watch committee's recommendation that extensions be carried out at the Victoria Courts and police offices at an estimated cost of £29,925, and this scheme was also sanctioned.

A tablet containing a list of the vicars has been erected in St. Mary's Church, Chigwell. The memorial has been designed in the Fifteenth Century style. It is composed of dark oak, enriched with tracery and moulded cornice. The latter contains a carved running ornament, and is surmounted by a pierced foliated cresting. The memorial has been executed by Messrs. Harry Hems and Sons, of Exeter.

A sub-committee of the highways committee of the Cumberland County Council have had under consideration various schemes for dealing with the bridge over the Greta at Keswick, on the road to Crosshwaite, beside the pencil mills. The full committee have adopted their recommendations for the construction of a ferro-concrete bridge, of one span, 36ft. wide, including a 6ft. wide footpath, at an estimated cost of £2,600. The recommendation will come before the county council next week.

At Tuesday's meeting of the Atherstone Board of Guardians the chairman reported having had an interview in London with Mr. Kitchin, chief architect to the Local Government Board, with regard to the alterations proposed to be carried out at the workhouse. As a result of that interview he recommended that the infirmary be extended, at an estimated cost of £3,027; that a new kitchen be erected, at a cost of £682; and that a residence be erected on workhouse premises for the master, at a cost not exceeding £600. The recommendations, which will involve an outlay of about £5,700, were adopted.

The inauguration of the tower that the town council of Aberdeen have erected on the historic field of Harlaw, near Inverurie, in memory of Provost Davidson and the burghesses of Bon Accord, who fell in the battle fought there on July 24, 1411, took place on Friday. The memorial, which has been erected near the site of Drum's Cairn, where Sir Alexander Irvine of Drum fell, is a hexagonal tower, about 45ft. in height, and 13ft. in diameter at the base. Built of rough granite stone, largely composed of boulders got near the site, the monument bears several inscriptions. The designer is Mr. William Kelly, architect, A.R.S.A., Aberdeen.

REBUILDING IN BISHOPSGATE, LONDON, E.C., FOR THE LEATHER

PARLIAMENTARY NOTES.

THE LUMSDEN APPEAL.—Mr. Roysd asked the Chancellor of the Exchequer on Thursday in last week whether, in view of the equal division of opinion of the House of Lords in the Lumsden appeal, and of the provisions of the Revenue Bill, which, if passed into law, would exempt builders' profits from claims for increment value duty, he would agree that the Commissioners should pay the costs incurred by Mr. Lumsden in prosecuting his appeal. Mr. Montagu replied that the Chancellor of the Exchequer regretted that he did not see his way to accede to the request.—Mr. Chamberlain asked whether the Chancellor of the Exchequer did not give something like a promise that in a fair test case the Treasury would pay the expenses of both parties, and did he not think that a case of this kind, where the Government propose to repeal the decision by amending the law immediately after it has been given, was a fair case for paying the expenses? Mr. Montagu: My right hon. friend is of opinion that the matter is on all fours with minus site values in Scotland, when the same decision was arrived at.—Replying to Mr. Chamberlain, Mr. Asquith said he understood that this case (which had already been decided in favour of the Crown by the Revenue Judge and in the Court of Appeal) had now been decided in favour of the Crown by the House of Lords. The Government were prepared to introduce and pass this Session a one-clause Bill as suggested by Mr. Chamberlain, giving relief to those who were affected by the decision, provided the measure was treated as unopposed.

THE PREPARATION OF VALUATION LISTS.—A deputation representing the Conference of Assessment Committees in England and Wales waited on the President of the Local Government Board on Friday, Sir J. W. Spen, M.P., acting as spokesman for the 360 committees, and presented a resolution strongly deprecating the proposal that the preparation and approval of valuation lists for local rating purposes should be transferred to a Government Department. In reply, Mr. Herbert Samuel said they were a little premature in their alarm. There was a proposal that the preparation of valuation lists should be transferred to the Land Valuation Office, but there was no proposal that the preparation of valuation lists should be transferred to a Government Department. The assessment committees would continue as they had done in the past. The existing gross inequalities in rating assessment became of greater importance when the Imperial Parliament proposed to give grants in aid of local rates on the basis of rateable values. If there was to be a special rating of land with a view of lowering the rates on houses and improvements, they must have a special assessment of land valuation, and the Valuation Office had been for the last four years accumulating enormous masses of material as to the actual value of the land for the whole country.

THE PROPOSED NEW R.I.B.A. CHARTER.—In the House of Commons on the 17th inst. Mr. Stuart-Wortley asked the President of the Board of Education whether the Royal Institute of British Architects was applying for a grant of a new Charter; whether an opportunity would be given for petitions to be presented by persons whose interests are affected by the modification of such Charter; by what authority the questions raised by such petitions would be heard and determined; and whether he could give any information as to the time of such hearing and the procedure to be followed.—Mr. J. A. Pease: I am informed by the Lord President of the Council that no petition to the King in Council praying for the grant of a new Charter to the Royal Institute of British Architects has been lodged at the Privy Council Office. Should any such application be made, formal notice of the presentation of the petition would be published in the *London Gazette*, and persons interested could then lodge petitions for or against the Charter *pro et contra*. All such petitions, together with the original petition, are referred by his Majesty to a committee of the Lords of the Council for consideration and report.

MOTOR-OMNIBUSES AND ROAD MAINTENANCE.—In the House of Lords on Tuesday it was agreed, on the motion of the Earl of Donoughmore (Chairman of Committees) "That it is desirable that a Joint Committee of both Houses be appointed to inquire and report as to the present law relating to the running of motor-omnibuses and trolley vehicles under statutory powers and otherwise; whether any amendment is necessary with respect to the control to be exercised by local authorities; and what contribution, if any, should be payable towards the cost of road maintenance by the proprietors of such vehicles." Lord Monk Bretton suggested that the terms of reference should be enlarged so that the inquiry should include the question of establishing a Board of Control for London.

THE VENTILATION OF THE HOUSE OF COMMONS.—The Select Committee which is inquiring into the question of the ventilation of the House of Commons considered on Thursday in last week a joint recommendation for experimental trials of a new system from Professor A. H. Barker and Dr. Leonard Hill. These experts state that to make the trials fully adequate it is necessary on occasions that the House of Commons or Committee-rooms should be crowded. To obtain a crowd is a difficulty; but the help of the War Office might be sought and soldiers borrowed for the purpose. Failing this, London hospitals might be asked to send contingents of nurses off duty to make the crowd. The Committee, presided over by Mr. Charles Bathurst, unanimously resolved to ask the Office of Works to give their authority for the conduct of such experiments during the coming autumn.

Harrogate Corporation have received the sanction of the Local Government Board to the borrowing of £6,000 for the enlargement of the Kursaal.

A new police-station is to be built near the town-hall, at Batley, and in harmony with that institution, at a cost of about £6,300.

A labour exchange is about to be built in Lord Edward-street, Dublin, from plans by Mr. A. Robinson, architect to H.M. Board of Works. The cost will be about £12,000, and the builders are Messrs. Collen Brothers, of East Wall, Dublin.

Mr. H. R. Hooper, M.Inst.C.E., has held an inquiry on behalf of the Local Government Board at the town-hall, Burton-on-Trent, into the town-council's application for sanction to borrow £25,000 for the purposes of improving the gas undertaking.

The Harrogate Corporation has received the sanction of the Local Government Board to the borrowing of £6,000 odd for the enlargement of the stage at the Kursaal. The scheme is to provide a stage area double the width and treble the depth of the present one.

The tower of the church at Holme-next-Runcton, Norfolk, is about to be strengthened and repaired in accordance with a report made by Mr. Herbert Green, the diocesan architect. The builders' work is to be entrusted to Messrs. Neal Bros., contractors, of North Elmham, Norfolk.

Lord Derby formally opened on Friday the first part of the new hospital for crippled children at Leasowe, near the seashore of the Worrall Peninsula, and laid the foundation-stone for the administrative block. The plans for the sanatorium were drawn up by Mr. T. W. Haigh, architect of the new children's infirmary in Liverpool.

A new wing added to the Howell School for Girls at Denbigh, was formally opened on Monday. The Drapers' Company of London had made a grant of £7,500 towards the cost of the additional wing, of which Messrs. J. Barnsley and Son, Birmingham, were the builders, and Messrs. Comyns and More, London, the architects.

The King, having learned that there were at Windsor several pieces belonging to armour shown in the Tower of London, has commanded that these should be returned to complete those suits of which they originally formed part. The armour in question belonged to Henry VIII., William Somerset, Earl of Worcester, and Sir John Smythe.

The corporation of Wrexham discussed on Tuesday the proposed erection of a town-hall, and the borough surveyor was directed to prepare a plan showing the whole of the properties bounded by Henblas-street, Queen-street, Rhosddu-road, the northerly boundary of the vicarage grounds, Chester-road, and Chester-street, and to colour on the plan the lands and buildings belonging to the corporation.

The new drill-hall which has been erected by the Staffordshire Territorial Force Association in Nineveh-road, Handsworth, for the accommodation of the North Midland Mounted Brigade Field Ambulance of the Royal Army Medical Corps, was opened by Colonel J. H. Wilkinson on Saturday. The buildings are of brick, the front elevation being faced with coloured Stourbridge bricks, with Hollington stone dressings.

An open verdict was returned at the City Coroner's Court on Tuesday, at an inquest on Thomas Alexander Ross, a scaffolder, of Stepney, who had been locked out owing to the building strike, and whose body was recovered from the Thames at Custom House Quay, Lower Thames-street, on Saturday. The widow said her husband had been very much worried, because he had no work. He had been receiving 10s. a week from his Union, but earned much more than that when employed.

Our Office Table.

As a memorial to the late James Mitchell Whitelaw, whose promising career as an architect was cut short by his death in July last year, while bathing, at the early age of twenty-seven, a committee of architects, with Mr. Arthur G. Shoosmith as chairman and Mr. George Pildes, 11, Melbury-road, Kensington, as secretary, are arranging for publication of some of his principal studies, with an introductory essay, at the price to subscribers of one guinea. It will include numerous prize designs of the Royal Institute of British Architects, the Royal Academy, and the Glasgow School of Art; various other design studies, a series of beautiful measured drawings, and many miscellaneous freehand drawings. The committee have fortunately secured permission to include as a frontispiece an excellent portrait in charcoal done from the life not long before Mr. Whitelaw's death. The plates, about forty in number, will be done in collotype, measuring approximately 15in. by 11½in., and will be issued in book or portfolio form as desired.

An improvement has been carried out at Carlisle Cathedral by the corporation, with the consent of the Dean and Chapter. A dangerous corner of the churchyard wall has been cut away at the entrance to Paternoster-row from Castle-street, and a fine view of the nave and other portions of the Cathedral from the north opened up. Formerly this interesting part of the Cathedral, which includes the window of the north transept, containing stained glass in memory of the children which Archbishop Tait lost by death from fever when Dean of Carlisle, was half-hidden from view from the north in Castle-street. Now, with the light railing and gateway which have been put up in place of the heavy wall, the full beauty of the northern portion can be seen. It has been suggested that for the heavy railing from Paternoster-row to the main entrance lodge there might be substituted a light ornamental railing, and the trees along the churchyard wall removed. If the suggestion were carried out an unobstructed view would be given of the whole of the northern and eastern portions of the Cathedral.

Mr. P. Harris Mitchell, of Chard, has lent to the Victoria and Albert Museum a Gothic bench, for many years in the Green Dragon Inn at Combe St. Nicholas, Somerset, and this is now exhibited in the Department of Woodwork, in Room 21. The woodcut in Parker, in spite of its bad drawing, shows that an important detail of decoration has been lost since his day—viz., the figure of an angel bearing a shield, which formerly constituted the terminal of the curious overhanging beam on the left side of the bench. This loss is the more regrettable as the device on the shield, which appears to have been a goat's head, might have afforded a clue to the origin of the bench. It has been set up against a background of linenfold panelling, and adjacent to a Gothic window-frame in oak, from Hadleigh, Essex, recently presented to the Museum by Mr. A. H. Fass, while other appropriate furniture is placed in the neighbourhood. In Room 52 is also displayed a recent purchase of a quantity of plasterwork, decorated in "grisaille," which was acquired for the Museum from an old house at Stodmarsh, Kent. These panels fall into two groups, one representing the story of Diana and Acteon, flanked with full-length drawings of a lady and of her maid in costume of the middle of the 16th century; and the other group consisting of emblems of four of the planets—Jupiter, Venus, Mercury, and the Moon—each with one of the signs of the Zodiac and a landscape emblematic of one of the months. Technically, they suggest a simple and effective method of wall-decoration, to which those now endeavouring to revive the art of mural painting might well give their attention.

Mr. Thomas Cave, of Broadwaters, near Kidderminster, has been pursuing inquiries into the life-history of Richard Baxter and his ministry in the parish church of Kidderminster. All biographers of that divine have

been led astray, Mr. Cave shows, by following, without independent investigation, the subjoined passage (p. 84) in Mathew Sylvester's "Reliquiæ Baxterianæ," a folio volume published in 1695—viz.: "The congregation was usually full, so that we were fain to build five galleries after my coming thither." This has been accepted as stating that on either side, both north and south, of the parish church of Kidderminster two tiers of galleries were erected for the great divine, and that a fifth gallery was built up at the west end of the church. By careful study and comparison of several documents in the Registry of the Diocese of Worcester, and entered between 1651 and 1680, Mr. Cave proves that the said "five galleries" were a number of additions, each of a few pews, in continuity and on the same level, on the south side of the nave of the church. Indeed, the comparatively low pitch of Kidderminster church makes it highly improbable that a double tier of galleries could have been raised against the nave arcades.

In the first annual report of the Forestry branches, recently constituted in the Board of Agriculture and Fisheries and the Office of Woods, it is stated that the total area of woodlands in England and Wales is 1,884,100 acres. Over 95 per cent. of this area is privately owned, and it is probably producing not more than one-half of its maximum yield. A conservative estimate of the value of the property would be between £25,000,000 and £30,000,000. The detailed treatment of this woodland lies in the hands of woodmen who work for the most part under the direction of land agents. At present there are no indications that the academically-trained forester will participate to any extent in its direct management. In regarding the afforestation problem from an economic point of view, the outstanding feature is the absence of accurate information as to the actual afforestation area and of the productive capacity of the land in question. To meet these difficulties the Board propose to collect accurate information by means of organised inquiries or surveys, and to secure land for commercial planting in typical districts where there is a large area of uncultivated land, and where a prima-facie case for afforestation has been established. The total expenditure on education amounted to £1,000, divided equally among the forestry schools at Oxford, Cambridge, Bangor, and Newcastle, that amount being exclusive of a proportion of a sum of £1,200 granted to the Royal Agricultural College, Cirencester, in respect both of agriculture and forestry.

That the price of timber must, on the whole, continue to rise steadily is the view expressed in this annual report of the State Forestry Branches. One disquieting fact revealed is that as definite surveys are made into the extent of virgin forests in various parts of the world, the results disclose that the reserves are by no means as large as had been anticipated. The total area of woodland in England and Wales is 1,884,000 acres. Over 94 per cent. of this is privately owned, and, says the report, it is probably producing not more than one-half of its maximum yield. It is not possible to make an accurate estimate of the value of this property, but a conservative estimate would be between 25 and 30 million pounds sterling. The improvement of existing woodlands is an important matter. If it were possible to raise the production by even 10 per cent., an effect equivalent to the afforestation of at least 100,000 acres would be obtained.

Timber merchants are constantly on the look-out (says the Bulletin of Kew Gardens) for new sources of lumber, and at the present time attention is being paid to the forests of Eastern Siberia, Manchuria, and Korea, from whence a good class of pine wood, equal in quality to yellow and red pine of North Europe, and Canadian yellow pine, is procured. During the last two or three years several experimental cargoes have been brought to European ports, where the timber appears to have created a good impression, although the heavy freight charges incidental to its 12,000 miles journey are a serious handicap. A Liverpool merchant gives the

freight charges per standard of Canadian pine to Liverpool as about £2 2s. 6d., whereas the charges per standard from Eastern Siberian ports are about £7 10s. In its favour is the fact that larger timber can be procured, at the present time, from the Far East than from the readily accessible European and North American forests, imported logs of Siberian pine being from 18ft. to 23ft. long. Siberian yellow pine is the timber of *Pinus koraiensis*, a tree growing up to 150ft. high in Eastern Siberia, Korea, and Manchuria. It belongs to the five-leaved group of the genus, and is recognised by its cylindrical, resinous winter buds, by the pubescent bark of the young wood, its dark green leaves 3½in. to 4½in. long, each with two glaucous lines running the full length, and by its cylindrical lines, which are from 5in. to 7in. long, with stalks an inch or so in length. The scales of the cones are large and prominent, and the basal ones are recurved. It has been grown in English gardens since 1861, the date of its original introduction by Mr. J. G. Veitch. It does not, however, take kindly to our gardens, and few fine specimens are known.

It seems, from the report of the American Wood Preservers' Association, in conjunction with the United States Department of Agriculture, that there was an actual falling off in the quantity of wood-paving blocks treated during the two years 1912 and 1913, compared with the record of 1911, and in this industry the status is not encouraging. One reason, doubtless, is the increasing use of concrete for street-paving, as the wear on wooden paving, under heavy traffic, is necessarily rapid, and where conditions are severe it is not practicable to prolong the life of the pavement by arresting decay, to any such degree as is possible where the traffic is light and where the deterioration of the blocks takes place mainly through decay of the wood. We know that here in London by now! Altogether, the increase in the use of treated timber was about 22 per cent. compared with the quantity treated in the year 1912. This increase represented an increased consumption of 29½ per cent. of creosote oil and 27½ per cent. in zinc chloride, while in other preservatives of miscellaneous character the increase was about 26½ per cent. It thus appears that the use of zinc chloride is advancing at about the same rate as the use of creosote.

The health committee of the corporation of Hull adopted on Friday last a housing scheme estimated to cost £110,000. The site selected, known as the New George-street area, is largely a slum district. It is proposed to demolish 252 dwellings reported to be unfit for human habitation and to erect 282 dwellings, at a cost of £250 each. The yearly income is estimated at £3,435, and the charge on the rates at £2,382, or a little over a halfpenny rate. It was urged that it was unfair to charge rentals which would not cover the whole charges and to saddle provident ratepayers with the loss. Alderman Askew, the chairman, replied that if they perpetuated slum areas they equally saddled the ratepayers with the cost.

In his annual report upon the work of his department for the year ended March 25, Mr. Lessel S. McKenzie, the city engineer of Bristol, states that the number of dwelling-houses erected during the year is the lowest number but one on record, and that with the number of void houses reduced to 2,600, the housing question will very soon become serious, if it has not already done so. "It would appear," Mr. McKenzie goes on to state, "that as regards the housing of the poorest of the poor, the most practical solution would be for the work to be taken in hand by the local authority, aided by grants from the National Exchequer. During the year a town-planning and city development sub-committee was appointed by the sanitary committee, but very little, so far, has been done. However, the Local Government Board having now considerably simplified the procedure under the Town-Planning Act, which hitherto was very cumbersome and costly, it would appear to be wise to seriously consider the advisability or

otherwise of preparing a scheme of town planning under the Act, especially in view of the necessity, which must shortly arise, of the extension of building operations."

In a lecture given at the closing session of the International Municipal Congress on Town Planning, held at the London County Hall, Spring Gardens, Senator Fletcher presiding, Mr. C. M. Robinson, Rochester, New York, a town-planning architect, read a paper in which he stated that eight of the more populous States had conferred upon their cities the right to establish city-planning commissions. The members of the commissions served without remuneration, and they were given the privilege of employing experts. The State legislation provided the machinery for town planning. There was also legislation for promoting the efficiency of town planning. Several States had the right to lay out land beyond the city limits. At the present time certain States had extended their control even further, and some, including New York, had set no definite limit, and had followed the lines of the English Town-Planning Act. The State of Pennsylvania had passed an Act giving to Philadelphia the right to establish a metropolitan town-planning commission, which would operate for twenty-five miles. So far they were feeling their way very carefully and slowly, each State acting independently by itself. They were approaching the English town-planning legislation not in a federal, but in a State, way.

Presiding at the ordinary general meeting of the British Portland Cement Manufacturers, Ltd., at London on Monday, the Hon. F. C. Stanley said that, with regard to the company's trading, it was a matter for congratulation that, in a period of considerable difficulty, they were able to show results substantially better than for the previous year. They had exceeded the profits of the earlier year by £24,000, and this increase would have been appreciably greater had not financial conditions adversely affected constructional work. Another factor that had acted against them had been the frequently recurring labour disputes in all parts of the country, and notably in London and Dublin. The London dispute still continued, and in the meantime their deliveries to London, which was the greatest cement-consuming area in the world, was held up. He ventured to say, however, that with improved financial conditions, cessation of labour disputes, and more settled trade conditions, they would, before long, witness more prosperous times again. The gross profit for the year amounted to £338,428, an increase of over £24,000. After deducting directors' and trustees' fees, debenture stock interest, and certain other items, there remained a balance of £250,500. Together with the balance of £31,000 brought forward, they had a total of £283,068. The directors recommended that the balance of the preliminary expenses, amounting to £11,755, be written off, that £40,000 be added to the depreciation reserve, and that a dividend of 7 per cent. be paid, leaving £64,322 to be carried forward. The report and accounts were adopted.

President MacLaurin, of the Massachusetts Institute of Technology, announces the resignation of Professor James Knox Taylor of the Department of Architecture and the appointment of Mr. Ralph Adams Cram to Professor Taylor's place as senior professor of architecture. Mr. Cram will continue the active practice of his profession, and it is believed that his presence on the Faculty will insure the school being kept in close touch with the problems of the day and the needs of the profession. Professor William H. Lawrence, a graduate of the Institute, who has for many years been Professor of Architectural Engineering in the department, will assume the position of chairman of the Department of Architecture and will be responsible for the administrative routine.

The association of vanadium with petroleum and asphalt, and its relationship to the formation of asphaltic deposits, is dealt with by Messrs. R. M. Bird and W. S. Calcott in a paper published in the Bulletin of the Philosophical Society, University of Virginia.

Trade News.

WAGES MOVEMENTS.

COVENTRY.—After a stoppage of work of nearly three months, terms of settlement have been arrived at in the Coventry building trade dispute. The majority of the workpeople returned to work on Monday, and the remainder will resume work as the jobs are ready. The terms of settlement finally accepted were suggested by Sir George Askwith, who presided at conferences of the parties in London, a further meeting of the parties being held at Coventry. The agreement provides for a halfpenny an hour advance in wages to the various sections of the skilled workmen, as from January 1, 1915, and an advance of a halfpenny and increased payment for overtime from December 1 to the labourers; no further alteration to be made before April, 1916.

The dock commissioners of Ipswich have considered and adopted the plans and specifications drawn up by their engineer for the important improvements authorised by a private Act last year.

In the House of Lords on Tuesday the London County Council (Tramways and Improvements) Bill was read a third time, and the Mall Approach Improvement Bill was given second reading. Both measures have passed through all stages in the House of Commons.

A Local Government Board inquiry was held at Barnwell on Tuesday, before Mr. H. R. Hooper, with reference to the application of the urban district council for sanction to borrow £2,300 for the purchase of Cellfechan Farm, to be utilised as public walks and pleasure-grounds.

At yesterday's meeting of the City Corporation the improvements committee reported the continued illness of Mr. Frank Sumner, city engineer, and on their recommendation he was granted a further three months' leave of absence.

Mr. John Horace Castle, of Bedford, has been appointed surveyor to the Gooale Urban District Council. Mr. Castle has had previous experience at Worksop, Southgate, and Islington. Mr. W. Granger, who has been assistant surveyor at Gooale during the past two years, has obtained a similar appointment at Loughborough.

The marriage of Mr. Banister Flight Fletcher, F.R.I.B.A., F.S.I., C.C., barrister-at-law, eldest son of the late Professor Banister Fletcher, F.R.I.B.A., formerly M.P. for North-West Wilts, and Lady Bamford-Slack, widow of the late Sir John Bamford-Slack, formerly M.P. for Mid-Herts, took place at the Temple Church yesterday (Thursday) afternoon.

With reference to the scheme framed by the highways committee of the London County Council providing for a tramway from Victoria to Westminster Bridge by way of Victoria-street, Broad Sanctuary, Parliament-square, and Bridge-street, the works committee of the Westminster City Council report that they consider the proposal to be extremely undesirable. Apart from other considerations, the width of these streets was not such as to allow of the construction of tramways.

The Northants and East Midlands Surveyors' Association met at Northampton on Friday. An inspection was made of the Far Cotton tramway extension and the Bridge-street improvement works that are being carried out under the direction of the borough engineer, Mr. A. Fidler, who is the president of the association. The members afterwards visited the new South Bridge. Messrs. Alchin's engineering works, Messrs. Mulliner's motor body-building works, and Messrs. Phipps' brewery.

The Bradford Sewerage Committee propose to accept the tender of Messrs. Wm. Best and Sons, the contractors for the Angram Waterworks, for the completion of the construction of the tunnel to carry sewage from Frisinghall to Esholt. Messrs. Best originally secured the tender; but on an error being discovered in their tender, the contract was given to Messrs. Pethick, Dix, and Co. The latter were unable to complete the contract owing to financial difficulties. The amount of the tender is £121,616.

A guild has been established at Coventry with the object of preserving historic buildings and places of natural beauty. The City Guild has been formed on similar lines to the society at Stratford-on-Avon, which, though only two years old, has already done much good work. The guild will appeal to private owners and public bodies to preserve existing buildings of interest and places round which the religious and municipal life in the past has centred. The guild hopes also to guard open spaces now in use.

From the experiments recorded in this communication it is suggested that the Peruvian deposits of vanadium sulphide and oxide, which occur in alternate layers with asphaltite, are probably formed in the following way: Vanadates in solution in ground water come into contact with oils bearing hydrogen sulphide, and thus yield vanadium sulphide, which may travel with the oil and be deposited by meeting with carbon dioxide. In presence of atmospheric oxygen the vanadium sulphide acts as an oxygen carrier and converts the accumulating mass of oil into asphaltite. That this latter change may rapidly occur is shown by actual experiment in presence of oxygen, but no "asphalting" of mineral oil occurs when oxygen is excluded. The formation of asphaltite thus appears to be essentially an oxidation process in which active catalytic agents, such as vanadium, play a part.

At Brighton, Mr. Edgar Dudley, an inspector under the Local Government Board, held an inquiry on Tuesday into an application by the town council for leave to borrow £9,470 for purchase of properties in Makeborough-street and Western-road for urgently-needed street improvements.

The Wandsworth Borough Council, at their meeting on Wednesday, unanimously agreed to a scheme submitted by the City and South London Railway Company for the improvement of the means of access to the station near Clapham Common, including the provision of escalators.

The death has taken place at Whitby of Mr. Henry James Walker, architect, in his 66th year. The deceased was born in Ulverston, and was engaged in the building trade at Scarborough and Harrogate, until 1881, when he was appointed agent to the West Cliff Estate at Whitby by the late Sir George Elliott, Bart.

Tattershall Castle, Lincolnshire, will be opened to the public by Earl Curzon of Kedleston on August 8. The ceremony will be attended by representatives of the leading archaeological and antiquarian societies, and the party will be conducted round by Lord Curzon and Mr. W. Weir, the architect, who has been in charge of the works.

A Select Committee of the House of Commons have approved of the Glasgow Corporation Tramway Bill as it left the House of Lords. Opposition to that part of the Bill which proposed to construct a bridge across the Kelvin, and a new road running through Queen Margaret College to connect Queen Margaret Drive on the north side of the river and Byres-road and Great Western-road on the south side, was unsuccessfully entered by the University of Glasgow.

At the annual meeting of the Devonshire Association, held at Tavistock on Friday, Professor A. M. Worthington presiding, Mr. Hugh R. Watkin read an interesting paper on the use of a Norse standard of measurements by the Normans in the eleventh and twelfth centuries in building Torre Abbey and the churches of Kingskerswell and Cockington. Evidence showed, he said, that the Normans used the same Norse measurements to be found in Russia in the present day.

The Bannan Loch waterworks, which have been constructed by the Renfrew County Council for the purpose of augmenting the present supply obtained from reservoirs at Carmunnock, in the County of Lanark, were inaugurated on Thursday in last week. The works will serve growing districts in the parishes of Eastwood, Mearns, and Cathcart, lying immediately to the south of Glasgow. They have been constructed at a cost of over £25,000, and they increase the available supply by 300,000 gallons per day. Messrs. W. R. Copland and Sons, of Glasgow, were the engineers, and Messrs. Kinniburgh, Ltd., of Glasgow, the contractors.

At the last meeting of the corporation of Stoke-on-Trent, the gas committee recommended that the gas undertakings of the borough be placed under the control of a chief engineer; that Mr. W. Langford, the engineer of the Longton gasworks, be appointed chief engineer and manager, at an annual salary of £700, and that Mr. Robert Surtees be appointed chief assistant to the gas engineer, and resident engineer of the Burslem works. After a sharp discussion, an amendment was, however, carried that, pending the appointment of a chief engineer, Mr. Langford take over the control of the various works, and that he prepare and submit forthwith to the committee a report as to the advisability or otherwise of combining the four gas undertakings.

FURNITURE AND HARDWOODS.

Table listing furniture and hardwoods with prices. Includes items like Teak, Oak Planks, Walnut, Mahogany, and Rosewood.

STONE.

Table listing stone products such as Red Mansfield, Darley Dale, and Portland Stone.

* All F.O.R. London.

New school premises, added to the Tabernacle at Dursley at a cost of £800, have been opened by Sir Ashton Lister.

The salary of Mr. W. W. Shennan, surveyor to the Wirral Rural District Council, has been increased by £100 per annum.

The corporation of Folkestone have instructed Messrs. Mansergh to proceed with their tunnel scheme of sewerage, which is estimated to cost £29,000.

The corporation of Southampton decided at their last meeting to raise the salary of Mr. E. C. Rodda, their waterworks engineer, from £300 to £400 a year.

The canal connecting Buzzard Bay and Cape Cod Bay, shortening the distance between Boston and New York by seventy miles, was opened on Wednesday.

The foundation-stone has been laid of a Carnegie free library at Taibach, Port Talbot. It will cost £2,500, will be Classic in character, and has been planned by Mr. John Cox, surveyor to the Margam Urban District Council.

The roads and bridges committee of the Warwickshire County Council have decided to proceed with the reconstruction of the dangerous canal bridge on the main road between Bedworth and Bulkington, over which there has been much discussion for years past.

The first group of sixteen houses has just been completed of a garden tenants' estate suburb at Shirley, near Southampton. The estate has been planned by Mr. G. L. Pegler, F.S.I., assisted by Mr. C. J. Hair, A.R.I.B.A., of Southampton.

The death has occurred, at the ripe age of 85 years, of Mr. John Jones, a Carnarvon stonemason, who had become a personality through his association with the work of restoration which has been proceeding in the Castle for the last 40 years.

A 3,500,000 dol. office building is to be constructed at St. Paul, Minn., for the general offices of the Northern Pacific Railway and Great Northern Railway. It will be 290ft. by 232ft., thirteen stories high, with a basement and sub-basement.

The chapel for the grammar-school at Guildford, Western Australia, has just been consecrated. It is Early English in style, and the cost, about £40,000, was borne by Mr. C. H. Oliverson, of London.

There has been launched from the yard of Messrs. Duxford and Sons, Ltd., Sunderland, a steel caisson for the South Pier head at that port. It is 60ft. in diameter, 22ft. high, and weighs 2,000 tons.

TRADE NOTES.

The flat roofs over the additions to the offices of the South Manchester Guardians, Withington, have been waterproofed throughout with Pudlo, the powder which makes cement waterproof.

Under the direction of Mr. G. H. Lingner Barker, architect, Moscow Court, W., Boyle's latest patent "air-pump" concealed ventilator has been applied to Christ Church, Westbourne, Bournemouth.

In our notice last week, on p. 131, that Claridge's Patent Asphalte Co., Ltd., had opened an agency in Manchester to come with the work in the North Midlands District, the address of their representative, Mr. E. J. Thompson, should have been given as of 36, Spring Gardens, Manchester, instead of Spring Chambers.

CHIPS.

An hotel estimated to cost two million dollars is about to be built at Hartford, Connecticut, from plans by Messrs. Warren and Wetmore, architects, 3E, Thirty-Third-street, New York.

The foundation-stone had been laid of a new Sunday-school in connection with Holy Trinity Church, Gresley, near Derby. Messrs. Naylor and Sale, of Derby, are the architects, and Mr. Hodges, of Burton, is the contractor.

The Roman Catholic Bishop of Middlesbrough has laid the foundation of a permanent church of St. Lawrence at Lartington, near Barnard Castle. The contractors are Messrs. Lyons, of St. Peter's Works, Norton-by-Malton.

Consideration is being given to a scheme for linking up Eastbourne, Bexhill, and Hastings by a broad coastal road. The cost of construction is estimated at £65,000, and it is hoped that the Road Board will make a substantial grant.

Mr. Edward A. Crane, of the architectural firm of Messrs. Rankin, Kellogg, and Crane, Philadelphia, has resigned his office as city architect of Philadelphia. Mr. Crane had served his city in that capacity without-salary, since January 1.

The post of General Manager, Federated Malay States Railways, has been filled by the appointment of Mr. G. H. Fox, formerly chief resident engineer for construction, who has been succeeded by Mr. F. D. Openshaw as chief resident engineer for construction.

The foundation-stone of a Roman Catholic church of St. Peter has been formally laid at Mill Hill, Blackburn. The estimated cost is £7,000. The architects are Messrs. Pugin and Pugin, of London and Liverpool, and the builder is Mr. D. Haworth, of Blackburn.

Mr. Herbert Kelly, of 233, Camden-road, N.W., and of 108, Finchley-road, N.W., builder, of the firm of Messrs. Herbert and Edward Kelly, of Finchley-road, Hampstead, who died February 11, aged 71 years, left estate of which the net personalty has been sworn at £166,133.

The late Mr. W. Piffe Brown, solicitor, by his will, has left £1,000 each to five Gloucester churches—St. Nicholas, St. Michael, St. Mary de Lode, St. Mary de Crypt, and St. John the Baptist—"to be applied in or towards external repairs and restoration of such churches."

Mr. Otto M. Eidlitz and Mr. Burt L. Fenner, architects, in partnership in New York, have been appointed members of the Commission on Building Districts and Restriction of Height for that city. The commission are not expected to issue their report and recommendations for at least a year.

Toronto's building permits are making an excellent showing this year. For the six months ending June 30, the total was 13,476,140d., as compared with 13,584,725d. for the corresponding period last year. At Montreal, on the other hand, the building permits showed during the six months a falling off of 1,420,376d. in the value of the permits issued.

There is now under construction in Victoria, B.C., a reinforced concrete trunk sewer about two miles long, which is to drain about 425 acres in a rapidly-growing residential section of the city, as well as 1,000 acres in Esquimaux and 800 acres in Saanich. The sewer starts with a 27in. diameter and increases to a 36in. pipe at the outfall near Macaulay Point.

TO CORRESPONDENTS.

We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.

It is particularly requested that all drawings and all communications respecting illustrations or literary matter, books for review, etc., should be addressed to the EDITOR of the BUILDING NEWS, Effingham House, 1, Arundel-street, Strand, W.C., and not to members of the staff by name. Delay is not infrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

* Drawings of selected competition designs, important public and private buildings, details of old and new work, and good sketches are always welcome, and for such no charge is made for insertion. Of more commonplace subjects—small churches, chapels, houses, etc.—we have usually far more sent than we can insert, but are glad to do so when space permits, on mutually advantageous terms, which may be ascertained on application.

When favouring us with drawings or photographs, architects are asked kindly to state how long the building has been erected. It does neither them nor us much good to illustrate buildings which have been some time executed, except under special circumstances.

NOTICE.

Bound copies of Vol. CV. are now ready, and should be ordered early (price 12s. each, by post 12s. 9d.), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLVI., XLIX., LIII., LXI., LXII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXXI., LXXII., LXXIII., LXXIV., LXXV., LXXVI., LXXVII., LXXIX., LXXX., LXXXI., LXXXII., LXXXIII., LXXXIV., LXXXV., LXXXVI., LXXXVII., LXXXVIII., LXXXIX., XC., XCI., XCII., XCIII., XCIV., XCV., XCVI., XCVII., XCVIII., XCIX., C., CI., CII., CIII., CIV., and CV. may still be obtained at the same price; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Handsome Cloth Cases for binding the BUILDING NEWS, price 2s., post free 2s. 4d., can be obtained from any Newsgate, or from the Publisher, Effingham House, 1, Arundel-street, Strand, W.C.

Telephone: Gerrard 1291.

Telegrams: "Timeserver, Estrand, London."

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 6d. (or 3fr. 30c.). To India, £1 6s. 6d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 6d.

* Our Direct Subscription Agents for Australia are Messrs. E. T. Kibblewhite and Co., Printers and Publishers, 19, York Chambers, 105, Liverpool-street, Sydney, New South Wales; for Japan, Messrs. Z. P. Maruya and Co., Ltd., 11-16, Nonhasbi Tori Sancho-me, Tokyo; who will receive Subscriptions at £1 6s. per annum on our account. Copies of the Papers will be sent by us direct to the subscribers' addresses.

* The special rate to Canada is £1 1s. 8d. = 5dols. 27c. for 12 months, and 10s. 10d. = 2dols. 64c. six months. Our Direct Subscription Agents for Canada are Messrs. Sells, Ltd., 302, Bhaughnessy Buildings, McGill-street, Montreal, who will receive Subscriptions, £1 1s. 8d. per annum, on our account.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED, and crossed London County and Westminster Bank.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation Advertisements) is 6d. per line of Eight Words (the first line counting as two), the minimum charge being 4s. 6d. for 60 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

SITUATIONS VACANT AND PARTNERSHIPS.

The charge for advertisements for "Situations Vacant" and "Partnerships" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

SITUATIONS WANTED.

Advertisements not exceeding Thirty Words, inclusive of name and address, are inserted under the heading "Situations Wanted," free of charge.

Rates for Trade Advertisements on front page, and special and other positions, can be obtained on application to the Publisher.

* Replies to advertisements can be received at the Office, Effingham House, 1, Arundel-street, Strand, W.C., free of charge. If to be forwarded under cover to advertiser, an extra charge of Sixpence is made. (See Notice at head of "Situations.")

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations or stop orders for serial advertisements must reach the office by Tuesday morning to secure attention.

D. P.—No.

RHO.—Thanks, no.

L. J. M.—We know of none.

A. M.—The Leeds Fireclay Co. make a very useful dovetailed brick (Shoppee's) of light weight, and entailing no thrust on walls.

A. L.—See our Directory under "Shop-fronts."

BUILDER.—To encase a timber lintel with rebated stone as you propose, is not only a "sham," as you recognise, but it would be a bad piece of construction also; it would make a patched job on the soft where you appear to intend rendering the wood with cement. Nothing could be worse. The width of the span is not stated, and a flat brick arch in the interior of the wall, in any event, should be built. A solid lintel keyed as drawn, if deep enough, and a proper bearing stone used (laid on its natural bed), the work would stand, provided the load is not excessive, and the width of the span proportionate.

LIST OF COMPETITIONS OPEN.

Table with 3 columns: Date, Description, Name/Address. Includes Sept. 7—Designs for Public Elementary Schools at Lindasiret, York-road, Battersea; Oct. 31—Laying Out Show Grounds, Wayville West, Adelaide; Dec. 31—Planning Workmen's Settlement, Campine Coalfield; No date—Drawing or Photograph of English or Continental Metal Work.

LIST OF TENDERS OPEN.

BUILDINGS.

Table with 3 columns: Date, Description, Name/Address. Includes July 31—St. Stephen's School, Alterations to, Congleton; 31—Council School, Alterations to, Steeple; 31—Electricity Building, King's Hill, Weynesbury; 31—Church, Boom; 31—Four Houses, Pontlanfraith; 31—Council School, Alterations to, Tollebury; 31—Provided Infants' School, Additions to, Brighton; 31—Cottage, Alterations to, Houghhead Station, Duss; 31—Offices, Alterations to, Carville-road, Wallsend; 31—Restoring House at Toddlehill Farm, near Ellon.

CHARACTER IN ARCHITECTURE.

Individuality in design—the impress of mind upon matter—is, in architecture, to be measured by the degree of thought instilled. The plasticity of a medium is limited only by the amount of mental force applied; and since a force, to be effective, must be constant, character is almost synonymous with constancy, and shares its invariableness; for that which continually shifts and changes cannot possess definite character, either good or bad. Endurance, permanence, and constancy are thus the essential bases of character.

When, therefore, we speak of character in design, we refer to a mental impress. In art, in architecture, the artist and architect are shown forth in their work. Strong character is either definitely good or definitely bad; for among the average and mediocre we find copyism, and the adoption without thought of ideas at second hand, and in this case we can expect no definite expression other than that of the original designer, mangled or misinterpreted, possibly, when we make fac-simile quasi-correct copies of pictures; and, where the architect reproduces without the ability to define, modify, or improve traditional form, character, or mental impress, we do not look for and cannot expect effective work.

We have been told that the characteristics of Egyptian, Roman, and Greek are shown forth in their buildings. Where national style exists, more or less, we should naturally look for such. Where there is no national style there can be no national impress; and, therefore, in modern work we find, in place of the catholic, universal and average, the particular, partial, and individual. Walking along the streets we may frequently recognise this and that building as emanating from a certain hand or brain, and although it is said that this position may and does at times become modified and subject to change synchronously with a change of head draughtsmen, this is but further evidence in support of the main proposition, that character resides in measure related to brain-power; that, in this country, more particularly, perhaps, than on the Continent, with its academic influences, or in America, with a national style of a sort, we find in architecture the impress of the individual. Here we may say generally of our contemporary work that the mind is not only a measure of the man, but of his building; and the paucity of invention, the offence or the pleasure resulting to us from his work is a direct isolated impress as of a solitary die upon plastic clay. Perchance, say what we like about decadence of style, want of perman-

ence of traditional methods, and the like, there is in defined, individual impress much compensation for want of so-called national style.

If we fully understand that modern English architecture, if it has character, owes it to individual, as distinct from collective, influence, we shall see how vainly true character and expression are sought by the copyist, and the disher-up of old-time form and line at second hand; for, if we desire to impress genuine character upon our work and to stamp it with definite quality or character, we must press hardy our minds on matter, and establish direct contact with the media. There must be independent thought, an absence of reliance on precedent and example. We must eliminate from our minds not tradition (that would be folly), not the subconsciousness of contemporary attainment, which would be presumptuous; but the mind must be free, the attack of the brain upon the medium immediate and frontal; to the end, we might say, that impress upon the plastic may be whole-souled. If there be such a thing as originality, these principles of action will lead us to it; but it were better that we should say of a building that it has "character" rather than mere novelty.

Every designer has in him the power to accomplish original work and to give character to such work, and for this we look, the public looks, and the client pays; but too often necromancy and mountebankism supplant the originality we love, and patchwork inconsistency gives the death-blow to character, the unity of effect, which is the outcome of definite character. Earnestly we seek to discover character and true originality, encumbered of principles of design such as we have put forward. Too often, day by day, we fail to discover aught but shallow artifice; until it comes to this (and we all know it), that we walk along our streets, and the brand-new building never for a moment diverts our gaze. We never alter our pace, we do not trouble to cross the street to look at that which we intuitively feel is but a characterless replica of thousands, such. Lack of brain impress—that seems the trouble, and the cause of want of definite quality, of character; lack of a noble self-reliance, and absence of grasp and grip. If there be any excuse for it, it may be that the art of architecture being founded on practical construction, we cannot deal with our media with the facility and freedom of craftsmen engaged upon mere ornamental detail. No doubt, we need to proceed cautiously in our endeavours to evolve and give character and novel effect to architectural device; but,

say what we may, no reasonable excuse can be advanced for not seeking to remodel and refine old-time forms to suit immediate position and present duty.

Doubtless, we cannot all have master minds, and so it results in practice that one invents and others copy, and so, it may be, things are duly ordered to be. We are all supposed to have brains, but we do not all use them, is perhaps a better way of explaining why so much repetition lutes our city thoroughfares, adding year by year little of interest; the really powerful works of architecture, of definite character and expression, appearing as a few first-magnitude stars in a host of lesser luminaries. If we desire character in architecture we must, too, be sufficiently definite and stable ourselves to lay upon inert matter some measure of the dignity of life.

Style details, after all, should be regarded rather as words (or phrases, perhaps) ready-made and practically unalterable; or as fabric, of special print in line and colour, which we cut and fashion with resultant individual impress. In this way, true and definite character may be produced in old-time form as rearranged to suit practical needs; for, fine and noble, beautiful and gracious qualities of design are the result, not of particular detail, mould, or device, but of the manner in which such style details are grouped and modelled to general theme or ultimate effect, preconceived in the mind of the designer.

Character in architecture is therefore a direct reflex of character in the man. Firmness and constancy are reflected in stone and marble. The changeling, with his here-to-day and gone-to-morrow method, cannot impress character in design, because in truth he has no character to impress. If we desire to give definite expression to our work we must be definite ourselves, must launch, with all the confidence we can command, into the deep waters of independent thought and action, holding to sound first principles of design. True style, as outflowing from noble character, must result when we throw aside mental props and are loyal to our own thought and perception. Success, then, will be a measure of the sincerity and depth of that thought.

EXAMINATIONS IN ART, 1914.

The Reports of the Examining Committee for Art in England have been issued by the Board of Education. Beyond a general note at the head of these departmental reviews of the work done during the past two or three months there is no abstract, though a synopsis of some sort would have been useful, and might have been looked for. We here not, how-

ever, overlooked the "general observations" which are printed at the tail end. The examiners' initial remark is to the effect that fewer incompetent works were submitted this year than in 1913, but that still there is much room for improvement in this direction, and the fault is set down to the likelihood of students insisting upon entering these examinations contrary to the advice of their masters.

The results comprise less than 150 passes. Women are distinguishing themselves throughout the country pretty much as women have been doing of late at the Royal Academy, while in the National Competitions women are very much to the fore. In these Examinations in Art the proportion stands at about 62 women to 145 men. It is not easy to be exact as to the precise figures, as Christian names are not always to be identified; but, roughly, this is the relative record, and it certainly is remarkable as being the result of a level competition in which numerically the male candidates seem greatly in excess, though as to the entries of women as compared with men no information is given. The men hold their priority among those who have passed with distinction by the ratio of only 14 men to 10 women, the latter scoring equally in "Drawing" and distinctly in "Industrial Design," with Enamelling, Jewelry, and, naturally, in Embroidery women take precedence. Two men gained distinction for Modelling, and two passed, but no women scored for this subject. "Pictorial Design" passes were without any distinction results, and out of the eleven successes only one woman's name appears. Leeds School of Art heads the list with 16 passes, Leicester School of Art obtained 11, Manchester School of Art 10, Newcastle-on-Tyne 6, Birmingham 4, and Liverpool 3, and all of this trio were women, their subjects being Linen weaving or Jewelry or Embroidery. The Metropolis is not conspicuous, seven only figuring for the whole of Greater London. We need not pursue this annotation further, and only give our abstract for what it is worth. Its practical bearing on the subject of art is important, no doubt; but, after all, examinations in Art, as such, favour schools and teachers rather more than insure the creation of real artists and virile artistic results, even in the domain of arts and crafts. Painting, Sculpture, and Architecture prospered with the greatest distinction when examinations in art were unknown, as we know them, and, of course, professors had not been thought of.

The only architects on the Art Examining Committee are Professor Beresford Pite, Professor E. S. Prior, A.R.A., and Professor Lethaby, the first two being engaged with the examination of "Drawing," and the last-named with "Industrial and Pictorial Design." We have already referred to this picture work. Of "Painting," three passes with distinction and seven ordinary passes make up the sum about which a degree of improvement in the work is mentioned, with the exception of drawings and paintings from the nude, which evince a distinct falling off. In reference to "Architectural Drawing" the test has been made in the lines of draughtsmanship in pencil and in colour-washes. The student was asked to show his powers in the delineation of a Classical column, and, secondly, in the plan, section, and elevation of a building or portion of one. Only the smallest medium of knowledge of architectural archæology was expected or asked for, but an appreciation of architectural form, such as can be shown by a sympathetic line drawing, with values brought out by monochrome washes. Few candidates cared to express themselves in this easy and effective way, and the examiners add that in the majority of cases the remembrance of the Greek column and the setting out of the selected building was conveyed by mechanical exercises in a thin line, and also devoid of freedom of touch in the details. About half a dozen exercises had more assured draughtsmanship, but in the greater part feeble execution and lack of knowledge prevailed. The record does not say if anybody passed in this subject, but we imagine not.

Coming back to the "General Observations" set out at the end of these reports, it may be well to add that while the examiners have been compelled to speak of a great deal of the work submitted to them as unsatisfactory, yet, as a whole, they think it shows an advance upon that submitted last year, and in one or two cases a notable advance has been obtained. They, however, again regret, ex cathedra, that, generally speaking, the written answers to their questions have been better than the executed work. Knowing how much excellent teaching is given in the schools and how much excellent work is produced there while the students are in immediate touch with their teachers, the examiners go on to say, after seeing how inferior the examination work actually is, "they cannot help feeling that in the schools hardly enough attention is paid to the confessedly difficult task of teaching students to stand on their own feet and run alone." Quite so, and it is doubtful if any forcible feeding is conducive to healthy exercise in the production of Fine Art or its application. Some are led to fancy that the means becomes the end, while the learner gets so fed up with cramming that the normal digestive capacity is impaired, and any intuitive capabilities possessed by the student at the start are stultified by profound professorial programmes. If this appears to be the case at headquarters in the Royal College of Art—and we suggest that this year's Exhibition there gives that idea—how can better results be expected from the minor schools throughout the land, officered from South Kensington?

THE PRACTICAL APPLICATION OF REINFORCED-CONCRETE CONSTRUCTION.—II.

By WM. G. SHIPWRIGHT,
Licentiate R.I.B.A., M.C.I., Chartered
Surveyor (by Exam.)

The two principal remaining variations are the doubly-reinforced floor, constructed either in the slab form, or as a continuous floor. These floors have a resistance in both directions, and, assuming the spans to be equal in both directions, the strength is in either case doubled over that of the single reinforcement. The design in the former case will be as shown in Figs. 19, and for the three types (4in., 5in., and 6in., with rods as before), the safe loads will be found to be—

- 4' floor (190 × 2) = 380 cwt. per foot super.
- 5' floor (180 × 2) = 360 cwt. per foot super.
- 6' floor (240 × 2) = 580 cwt. per foot super.

The concrete remains constant and the steel is doubled, thus giving the cost shown in Fig. 21.

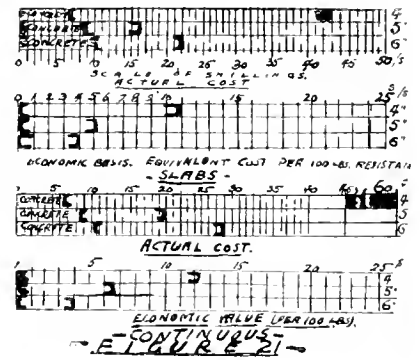

The design of the continuous double-reinforced floor is shown in Fig. 20. The strength of these floors is twice the similar single continuous floors, as follows:—

- 4' floor (240 × 2) = 480 cwt. per foot super.
- 5' floor (225 × 2) = 450 cwt. per foot super.
- 6' floor (360 × 2) = 720 cwt. per foot super.

The scale diagrams of cost is shown in Fig. 21. This type of floor is, of course, only suitable for positions where the bays are approximately square, so that the spans in both directions are about equal; otherwise the cost of extra steel to secure an equal resistance in an oblong bay, with a much greater length than width, would render this type excessively costly, for the reasons demonstrated in the 4in. floor. For spans equal in both directions the doubly-reinforced floor is the cheapest form, as the concrete is precisely the same as in the single floor, the steel only being doubled, whilst the floor has twice the strength.

The adoption of hollow tile in floor construction possesses undoubted advantages. The floor is rendered lighter and more sound and fire-resisting, without impairing its strength. The cost of hollow tile in floor construction usually averages about 2s. 6d. to 3s. per superficial yard of floor; but there is, of course, a small offset in the deduction of concrete, being about one-fourth the cost of the tile, making an approximate net extra of 2s. per yard. There is also a net saving of about 20lb. per foot in the dead weight of

the floor, which relieves the structural steel-work and foundations to the extent of about 800 tons on a building of 10,000 yards floor area. A usual process is to have the tiles of such depth that the top edge is approximately coincident with axis line, the floor being, in fact, composed of a series of small reinforced T-beams (see Fig. 5). Care

should be taken to secure sufficient area in the concrete rib to afford the necessary compressive resistance below the upper surface of the tile. Fig. 24 shows the correct and incorrect form of construction in this respect.

Fig. 22 shows at A the 6in. reinforced floor, with three 3/4in. rods per foot; at B, C, and D the steel joists are shown which would be required to carry the same floor-weight per foot super. (290lb. over 10ft. spans). The joists are spaced as follows:—

- At B 3in. × 3in. × 8 1/2lb. 1ft. apart 10ft. span.
- C 5in. × 3in. × 11lb. 2ft. apart 10ft. span.
- D 5in. × 4 1/2in. × 18lb. 3ft. apart 10ft. span.

The centering required for these floors will be approximately the same as that for the reinforced floor, and the cost of material on the basis previously adopted, is shown in Fig. 23, in which the surplus metal provided in B, C, and D is simply waste material, amounting in cost to between 10s. and 15s. over each bay of 6ft. square.

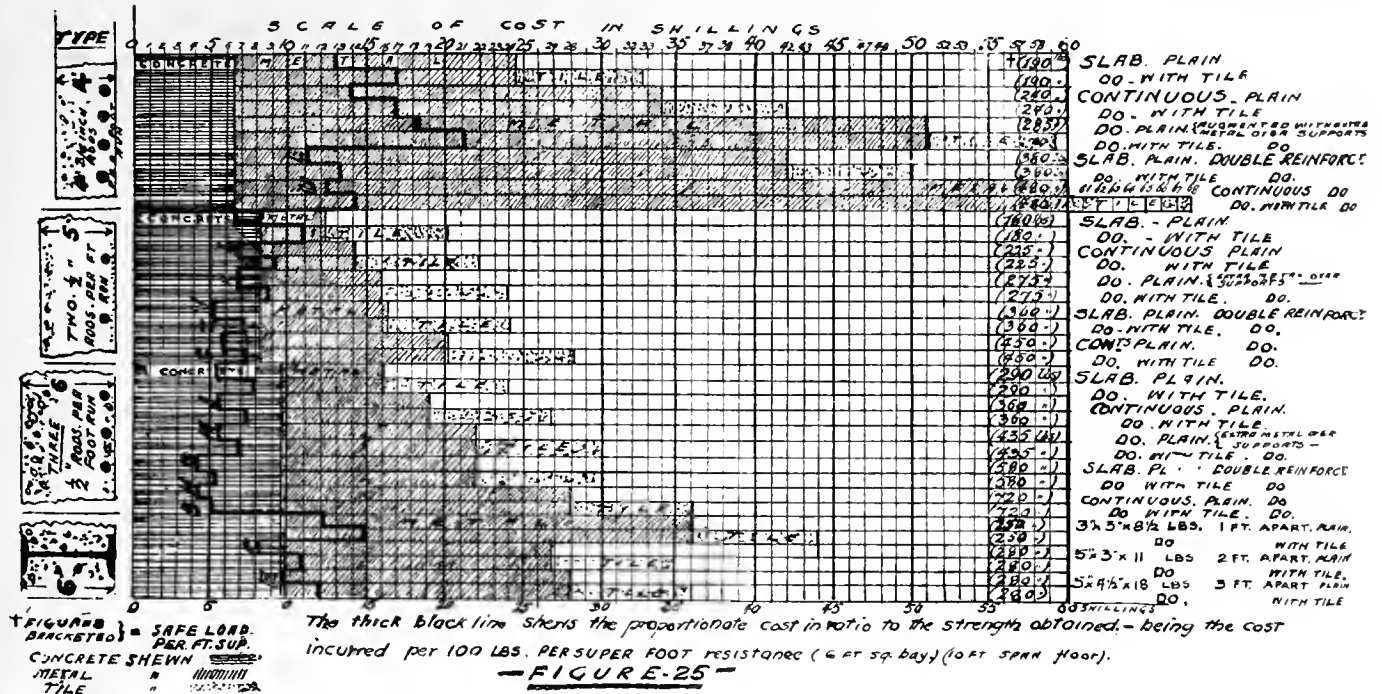

Fig. 25 is a summarised diagram, showing the actual cost of material on the basis previously given of all the types of floor illustrated and described, the calculation being in all cases for bays 6ft. square in floors of varying load-carrying capacity, and the

nine years. The present chapel on the island is believed to stand on the site of his hermitage. There are two lighthouses, preceding which Prior Castell's Tower, built about 1500, served a similar purpose, beacon fires being used. Longstone Island is the point from which William Darling and his heroic daughter Grace put off to rescue the survivors of the wrecked ship Forfarshire in 1838. A monument to her memory is placed in the Great Farne chapel, and a handsome canopied altar tomb, with recumbent effigy, is in the churchyard at Bamborough, where she is buried. Grace Darling was born in 1815, the year of the Battle of Waterloo, and she died at the age of twenty-five. Her nephew, Robert Darling, has recently given up lighthouse keeping after thirty-six years' service. On the return to the mainland, the afternoon was devoted to Bamborough. "King Ida's Castle, huge and square"—as described in "Marmion"—is a bold and prominent object in the landscape on the Great North road between Alnwick and Berwick. The castle was founded in 547, and was frequently stormed by the Danes. After Edward IV.'s time it lay dismantled for centuries. In 1720, Lord Crewe, the philanthropic Bishop of Durham, having purchased the Castle, bequeathed it for charitable objects. In 1894 it was acquired by the late Lord Armstrong at a cost of a quarter of a million and fitted up as a convalescent home.

so named from a metal figure of a lion dominating the structure. The afternoon was devoted to Alnwick Castle. The visitors were met by Mr. Kyle, Constable of the Castle, whose knowledge of the precincts placed them under infinite obligation. The Castle was founded by a de Vesci in 1150. It was rebuilt by the first two Percys between 1310 and 1350. The restoration of the Castle to its present stately form was the result of alterations and additions made by the first and fourth dukes. The family are at present not in residence, and the party were shown much of interest, including the State coach used by the Duke of Northumberland at the coronation of the last King of France in 1825; it was redecorated and again used at the coronation of King Edward VII.; also the museum of Egyptian antiquities, the geological museum, in which are numerous Roman and some Saxon inscribed slabs which have been found in Northumberland; the dungeon, the ancient draw-well, and Hot spur's seat on the walls. Near this part of the Castle is the "Bloody Gap," where tradition says a raiding party of Scots were slaughtered to a man while attempting to force a passage through a breach made in the wall. The "gap" is now built up, but the different colour of the stone indicates where the breach was made. During the afternoon time was found for a drive to the picturesque, ivy-clad ruins of Hulne Abbey, the first monastery of Carmelite Friars in the kingdom, founded by a de Vesci about 1240.

diagram shows by a thick line the comparative economic value—i.e., the cost involved in obtaining each 100lb. per super. foot loading resistance, from which it will be seen that the properly designed reinforced floors are by far the most economical form of construction, whether with or without tile filling. (To be concluded.)

ALNWKIC TOWN AND CASTLE.

On Friday week the visitors devoted their attention to many things of interest about Alnwick. In the morning the party proceeded to St. Mary and St. Michael's Church, where they were met by the Rev. Canon Mangin. It is a Norman church of large size, and is remarkable for its width, which Canon Mangin thought was designed to provide processional room for the monks of Alnwick Abbey on festival days. There are no elaborate monuments, the Dukes of Northumberland having found their last resting-place in Westminster Abbey. From the church the visitors walked to the site of Alnwick Abbey, formerly a foundation of Premonstratensian Canons, dedicated to St. James and the Blessed Virgin. It was founded in 1147 by Eustace FitzJohn. All that now remain of this extensive building are the tower and gateway. The foundations have been uncovered and cemented, and the various rooms can be traced. On leaving a visit was paid to Malcolm's Cross, marking the spot where Malcolm King of Scotland was slain in besieging Alnwick Castle in 1092. Near by is the ruin of St. Leonard's Hospital, founded and given to Alnwick Abbey by Eustace de Vesci some time after the death of Malcolm. The Lion bridge is

BERWICK AND WARKWORTH.

Saturday week was selected for an excursion to Berwick-on-Tweed and Warkworth Castle. The town has played a unique part in history. In the reign of Alexander of Scotland (1286) it was the second city to London. Its list of mayors goes back for eight centuries, and the vicars of Berwick date from 1296. The walls are of great interest, going back to Edwardian days. In a hurried visit, the various points of greater note—the walls, the old bridge, the bastions, and the parish church—were points of leading interest. The parish church of St. Mary, consecrated in 1662, replaced an older building, of which from 1549 to 1551 John Knox was minister. This church is the most northerly parish church in England. The afternoon was devoted to Warkworth Castle, now a ruin, which in the early days was the favourite residence of the Earls of Northumberland, and in Edward's time well maintained; but in 1672 its timbers and lead were disposed of and the principal parts of it unroofed.

WARKWORTH HERMITAGE.

Half a mile above the Castle is the Hermitage, widely known from the Bishop of

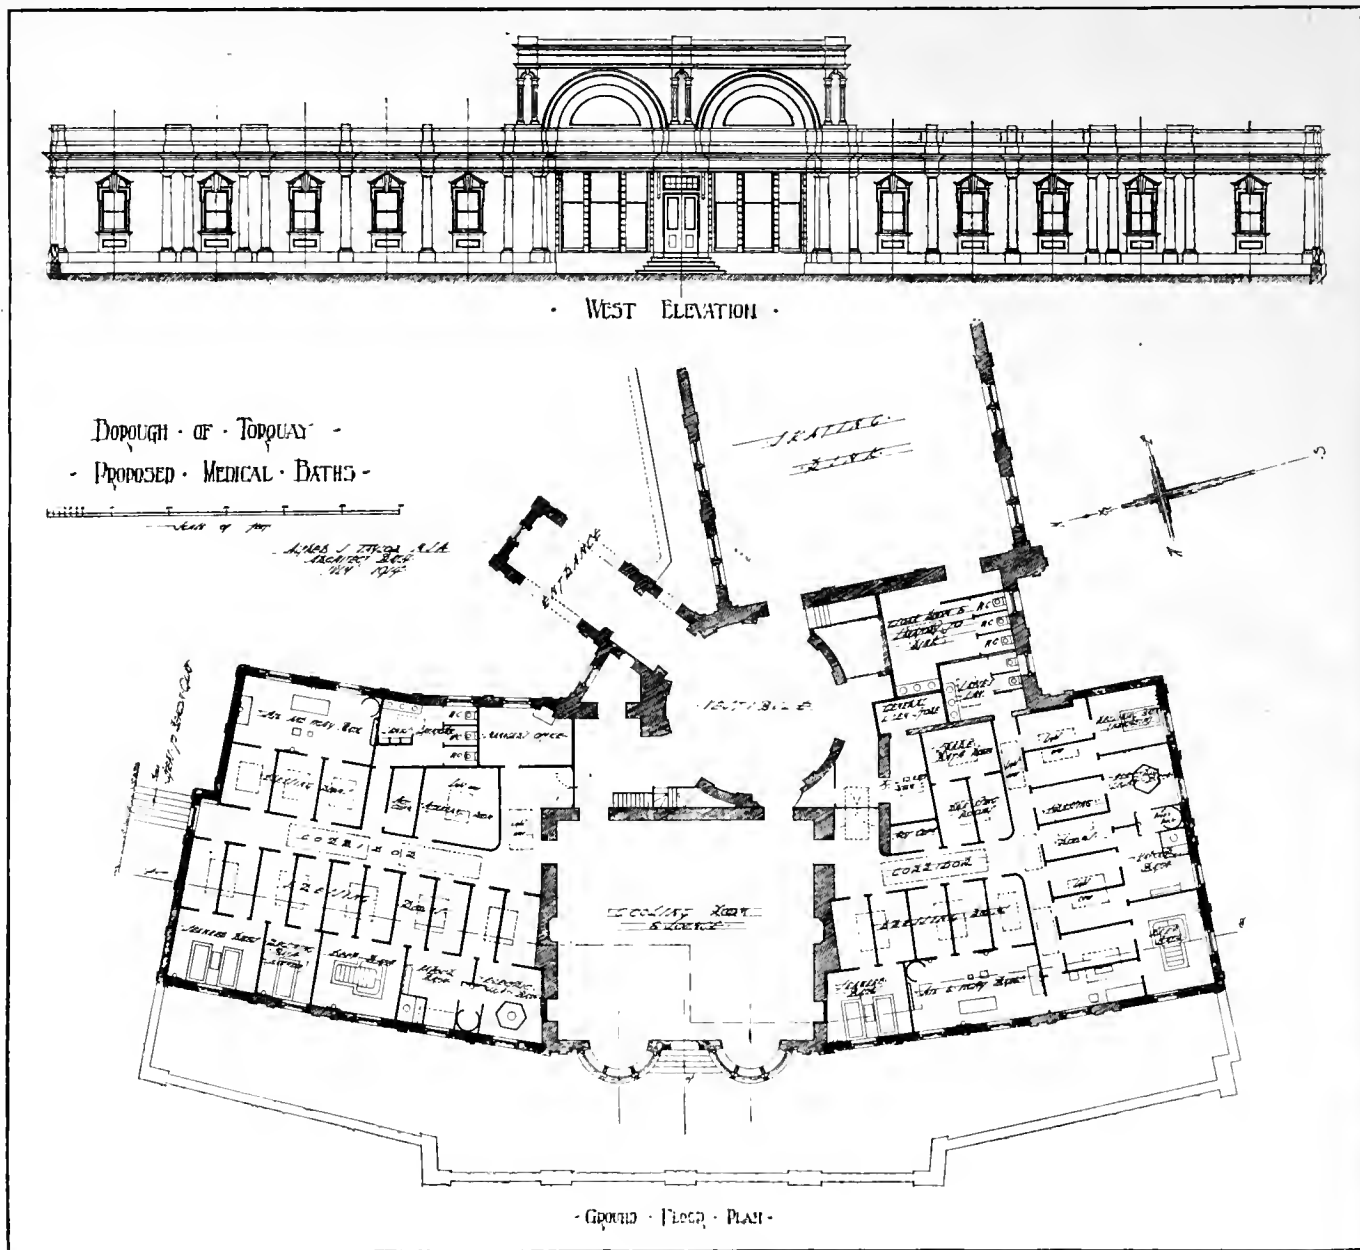

NORTH STAFFORDSHIRE FIELD CLUB.

THE NORTHUMBERLAND EXCURSION.

The "long excursion," under the auspices of the North Staffordshire Field Club, was a complete success.

THE FARNE ISLANDS AND BAMBOROUGH.

On Thursday week the excursion was to the Farne Islands and Bamborough. There are seventeen in all, forming three distinct groups. It was on the Great Farne that St. Cuthbert died in 687, after a residence of

MR. ALFRED J. TAYLOR, M.S.A., ARCHITECT.

Dromore's ballad of the "Hermit of Warkworth." Its origin and foundation are uncertain. The Earl of Northumberland, in his grant to the last hermit, in 1532, calls it "min armitage, helded in a rock of stone, in my parke, in honor of the Holy Trinity." Over the doorway is a rood and a Latin inscription. "My tears have been my meat day and night." There are three chambers, known as the chapel, confessional, and dormitory. In a recess to the south, lighted by two lancets, is the Hermitage. Kneeling on the west side is the figure of a man in contemplation of a female recumbent, with a bull's head (the crest of the Widdrington family) near, and the figure of an angel on the left. Popular tradition says the man was Bertram of Bothal; the female, the Lady Widdrington, whom he was to marry, and who had been captured by a border chief. Sir Bertram and his brother set out separately to search for her. Disguised as a minstrel, the former found the tower in the Cheviots where she was, but, seeing her escaping at nightfall with another man, he attacked and killed them both. Too late, he found that he had slain his own faithful brother in the very act of rescuing his betrothed, and so he became the Hermit of Warkworth and made a lifelong expiation. Descending, the hermit's oven is reached, and a stone stair leading to what was his garden above. Below are the remains of some later buildings 15th century or after, built for the convenience

of the chaplains who for a period ministered here in succession to the Hermit. A record exists granting various privileges to George Lancastr, chaplain at the Hermitage, by the sixth Earl of Northumberland in 1531. Sunday was observed as a day of rest. In the afternoon a visit was paid to Dunstanborough Castle, built about 1313, and now a magnificent ruin. The official programme terminated, and the party broke up on Monday morning.

The county council of West Sussex have approved the proposal to build new council offices at Chichester at an estimated cost of £15,000, exclusive of site.

At Sandgate Parish Church, near Folkestone, extensive alterations are to be made, a faculty having been obtained for taking down the galleries and erecting a reredos, forming a barrel ceiling to the sanctuary, and providing new communion rails, dwarf chancel screen, stalls, pulpit, and holy table. The work is estimated to cost £1,000.

The Montreal Builders' Exchange have been invited by Mr. D. Norman MacVicar, chairman of the Quantity Surveying Committee of the Province of Quebec Architects' Association, to cooperate on the question of quantity surveying. The Architects' Association desire to obtain the views of contractors, who are naturally as much interested in the subject as are the architects. A committee of the Exchange has therefore been appointed to go into the entire question with the architect.

NEW MEDICAL BATHS, TORQUAY.

This plan provides for converting the existing Bath Saloons at Torquay into a High Class Medicinal Bathing Establishment. The ladies and gentlemen's baths are separated by a large cooling room and lounge, common to both sexes. Till now this room has been used as a ball room. The new walls will be constructed of local stone, covered on their external faces with cement stucco. The partitions will be patent slabs tiled on the bathroom side with vitreous tiles to a height of 6ft. 6in. The roof will be composed of concrete carried on steelwork and covered with asphalt. Mr. Alfred J. Taylor, M.S.A., of Bath, is the architect.

Liverpool Housing Committee have recommended the appointment of Mr. Fletcher Turton, the present deputy city surveyor, as director of housing at a salary of £1,200 a year.

The committee of the Captain Scott Memorial Fund have accepted an offer of the Admiralty of a site at Greenwich Hospital for the erection of the memorial to the Antarctic explorers. The site faces the river and is mid-way between what are called King Charles's and Queen Anne's Buildings. The Admiralty stipulate that the memorial shall be in keeping with the character of the architectural surroundings, in the opinion of experts whom they will consult, and before the actual position is selected a light framework model will be made so that its effect may be judged *in situ*.

Currente Calamo.

What effect will war have on the Building Trades? The obvious dictates of common-sense should bring them full work and prosperity that would be shared by hundreds of cognate industries, and bring lasting and profitable benefit to the whole country. The work is waiting. From all parts of the country for months past the cry of the shortage of houses has been urgent, and the general prosperity of the past three years has accumulated capital which will instinctively turn to solid home investments. Land and houses never slump after the fashion which shut up the Stock Exchange last week, and gave us four Bank Holidays instead of one. One thing alone has hindered earlier recognition by capital of the opportunities afforded by real estate, and that has been the unfair and exceptional taxation of the investor and builder. We have at last been promised redress by Mr. Asquith. Surely that Bill could be passed as quickly as the Suspension of Payments Bill was passed last Monday? Capital that is likely to be shut out of other profitable fields for months to come would at once respond to the demands in so many directions for the support of a home investment, and this troublous time be consolingly remembered hereafter as a time of marked increase in our best national assets, and of full employment for the workers of the second great group of our national industries.

If only, of course, the threatened war in the building trades is not provoked with the audacity and foolishness of certain European potentates. When Britons and Irishmen are closing up their ranks, and forgetting or postponing all differences in face of the common peril, surely masters and men will get to work "as they were" at once, and agree to relegate all grievances to a more convenient period for their redress? At a time when national sacrifices of no small magnitude are likely to be demanded of all of us, there will be scant sympathy for out-of-work, idle thanks to their own obstinacy or foolish surrender to the wiles of mischievous agitators. The moment calls for the utmost conciliation on the part of the masters and the promptest recognition by the men that the best principles of trade-unionism demand reasonable determination that union funds shall not be exhausted by inter-union strife at a time when the supreme duty of all of us is to husband our resources to the uttermost and to seize and improve in every way the opportunities of honest and profitable work still open.

In common with our contemporaries daily and weekly, although there is no immediate shortage, we are compelled to husband our resources of paper, and to ask the indulgence of our readers, and especially of our advertisers, if we have to curtail our available space. We have done so very slightly this week, and fortunately it is, naturally, the slackest month of the year, so that few will be inconvenienced. We beg to intimate to our direct Continental subscribers that we are posting their copies as usual, but that we can assume no responsibility for delay or non-delivery as results of the disturbance of traffic.

The Beaux Arts Committee have now obtained suitable premises for a Second

Atelier, which will be opened in the autumn, and Mr. A. R. Jenmett, F.R.I.B.A., has accepted the position of patron. Communications should be addressed to Mr. Adrian Berrington, at the First Atelier, 16, Wells-mews, Wells-street, W. We heartily wish the Second Atelier as successful a start as the First has had, and have little doubt that ere long we shall record the birth of a Third.

In his question, to which we replied last week, "A Builder" proposed to encase a timber lintol with a keyed and rebated stone facing over an opening, to give an external appearance of masonry, thus perpetrating an architectural sham, besides making an incurably bad piece of construction. It reminded us of some other similar abortions actually perpetrated by so-called "practical" builders in the carrying out of their own designs, without the check of professional supervision. One of these was a case analogous to the one above, in which a timber was completely buried, thus risking dry rot. A window opening in a wall happened to be built several inches too wide for the casement frame which had been made for it; so to save the cost of altering the frame, which, when being offered up in position was found to be too small, the ingenious builder got over his difficulty by fixing up a length of an ordinary rough putlog taken from his scaffold, and in this way he reduced the opening to accommodate the window-frame; but the York stone sill was left unchanged. The consequence is it projects on that side of the window about 7in. more than on the other. The facing of the walls were roughcasted, so the builder drove some nails into the putlog to get a key and plastered over the wood, finishing the reveal in this fashion as if nothing had happened, and hiding the discrepancy.

In the same house, which has been erected in a London garden suburb (for a well known water-colour painter whose work is just now much in vogue), a soil-pipe is run up in front of the principal elevation on the face of the brickwork, below the projecting sham half-timbered gable which comes above; but the over-sailing of this gable is so slight that the fin, iron tube partly protrudes in front of the stucco panelling, with the most incongruous effect, particularly so as the pipe is not vertical, varying also in its relation to the face of the wall, in order to clear a rafter where the roof projects, and thus it passes, oddly enough, through the fling on one side of this apex, this sewer-gas vent not even assuming the character of a gable finial. This the ridge-tiles in any case would preclude.

The drawing room fireplace is set so close to the door that it is always in a direct draught, with the result that whenever a fire is lighted the smoke is more than often driven out into the parlour. A gas-fire, therefore, is employed; but the fumes still cause much discomfort, owing to the unpreventable side draught. That the artist in question deserves little commiseration is obvious, because, instead of consulting one of his architect friends before he had his house built, he made a bargain with the "practical" builder, who has achieved the result. The "half timber" is made up of inch boards planted on to the face of the plaster, and the work is curling up gracefully under the action of the sun. The owner

evidently effected no economy when he saved the dreaded architect's fees. Our correspondent adds that he was not personally acquainted with the painter for whom this residence was "put up" till he came to reside in it, and that the subject has never been mentioned between them. Time is, however, already making these little secrets known.

It has not taken long to "nationalise" the railways in the face of national peril. An Order in Council has been made under Section 15 of the Regulation of the Forces Act, 1871, declaring that it is expedient that the Government should have control over the railroads in Great Britain. This control will be exercised through an Executive Committee composed of general managers of railways, which has been formed for some time, and has prepared plans with a view to facilitating the working of these provisions of the Act. Although the railway facilities for other than naval and military purposes may for a time be somewhat restricted, the effect of the use of the powers under this Act will be to co-ordinate the demands on the railways of the civil community with these necessary to meet the special requirements of the naval and military authorities. More normal conditions will in due course be restored, and the public will readily recognise the necessity for the special conditions, and in the general interest accommodate themselves to the inconvenience involved. Not a few, perhaps, will hope that under joint control and Government supervision, some experience of co-operative action may be gained that may bear fruit in other directions when peace again favours traffic.

A novel point cropped up last week before a House of Commons Committee, presided over by Mr. Lane Fox, considering a Bill to provide Weston super-Mare with an improved water supply. The Somersetshire County Council wanted the insertion of a clause providing that when it was necessary to alter the level of, or improve, main roads any additional cost because of the necessity for moving the pipes of the Weston super-Mare district council should be borne by the district council, and not by the Somerset County Council. It was asserted that the county council had a public duty to perform in respect of the roads, and it was only fair, in the event of the urban district council's pipes causing any additional expense, that the cost should fall on the district council, and not be borne by the county council. The district council, while admitting this was fair in the case of bridges belonging to the county council, objected to it in regard to main roads which had to be improved to meet the weightier and denser traffic. It was contended that it was an attempt to put part of the burden which should be borne by the county council upon the district council. The committee unanimously decided to insert a provision as asked by the county council, and the district council will therefore be called upon to pay any additional expense involved by their pipes being in the main roads when main road improvements are made. This, we believe, is the first time such a decision has been given in respect of water mains.

A perpetual lease is often a good one, and, indeed, such a lease would, if it could be supported, become a freehold, and so not a lease at all, which must be for a term either

of years or of a life or lives. But although this is the theory of the law, there is, as usual, a way out in fact. For in practice a covenant in a lease to grant perpetual renewals of the term is held valid. This very pretty point was lately decided by the Court of Appeal, confirming the judge below, and the matter has some business interest and importance. It seems that a lease of certain premises had been granted as long ago as 1824 for a term of twenty-one years. This contained a covenant by the lessors that on the surrender of the lease on the expiry of the first eleven years, and on payment of a fine, they would grant a new lease for twenty-one years, with the like covenant. The deed then went on to provide that as often as every eleven years of the said term shall expire the lessee could claim such new lease. After running in this way for some ninety years, the lessors suddenly objected that this perpetual renewal was illegal and void. But the Court held the covenant was valid, as, although a perpetual lease was bad, a right to a perpetual renewal of an existing lease was good, and so this lease may go on renewing its youth for ever.

In the timber trade it seems that the "del credere" commission is common as between principal and agent. These Italian words mean "of the credit," and in such an agency the agent warrants or guarantees the payment of the debt contracted through him to his principal. In other words, he becomes liable for the solvency of the customer he introduces. But this is only a pecuniary obligation, and it does not compel the agent to indemnify his principal as to the performance of the contract. Nor is a "del credere" agent liable to litigate disputes between the buyer and the seller. Obviously there is a great deal of difference in these two views of the agent's position, and the question has often come up before the Courts. In the latest case of "Gabriel and Son v. Churchill and Sim" (July 14), in the Court of Appeal, where a dispute had arisen between the buyer and the timber merchant as to the carrying out of the contract, the merchants sued the defendant as "del credere" agent for the price of the goods. But it appeared that the plaintiffs had themselves been arranging with the buyer, and had got into a wrangle. So the defendants, as their agents, declined to pay the price and take over the litigation. The Court held that they were not liable, as their responsibility as "del credere" agents only applied to payment in case of the buyer's default by insolvency or the like.

The following, having completed their course in the School of Architecture, University College, have been awarded architectural certificates: H. N. Fisher, A. J. Villegas, and J. F. Villegas.

On St. James's Day the Bishop of Kingston dedicated the complete nave and baptistry of All Saints' Parish Church, Carshalton. This work, costing £5,800, is the last section of a much larger undertaking of a quarter of a century ago. The completion of the plan has given a church with accommodation for nearly 1,000 worshippers. The work has been done under the direction of Mr. C. J. Blomfield.

The old established firm of Edward Fench and Co., Ltd., Chesham (Mon.), successfully carried out the removal of an existing bridge carrying the North and South-Western Junction Railway way over the Great Western Railway at Shepherd's Bush, and replaced it with a new one in the short space of time of thirty-five minutes, which we understand to be a record one. The time allowed for it by the engineers was two and a quarter hours. The weight of the new bridge with ballast is about 150 tons.

AUDITORIUM VENTILATION.

Messrs. McKim, Mead, and White, the well-known architects of New York, in erecting the Convention Hall of the National Cash Register Company at Dayton, Ohio, have, with the assistance of the engineers,

FIG. 1.

Messrs. Nygren, Lenner, and Ohmes, completed a very elaborate system, described as being unequalled in America. The auditorium is provided with fresh air by means of a 9ft. centrifugal fan placed in the basement, in connection with tempering coils. Exhausts for clearing the building of vitiated air are provided, with an 8ft. 6in. by 2ft. 6in. centrifugal exhaust fan, located in the cellar, and a 66in. disc exhaust for summer ventilation, set up in the roof space. These are

FIG. 2.

worked by 20H.P. motor, and are adjusted to an installation for reversing the air-supply and exhaust. This system is arranged by reversing dampers to the registers close to the floors as well as near the ceilings.

Steel plates are used of reinforced 10 gauge, and all the contact surfaces are lined with piano felt, to avoid leakage either way. The tempering coils are in two sets and are enclosed by gauged steel-plate jackets. Hand-valves on the return ends of the coils are provided where they are not thermostatically controlled. The fresh-air chamber is provided with a set of air-filters contrived of galvanised-iron wire netting, covered with cheese-cloth, fixed to wooden frames, and having a total filter area of 1,300 square feet. In the "American Architect" several other particulars are given of this installation, as, for example, the 21H.P. motor for the fan heating the foyer, which is driven to give a speed of 400 revolutions per minute. The ducts are designed with curves and bends, so as to insure an easy flow of air. The air-washer is of 46,600 cubic feet capacity, and the building is heated by a return-line vacuum system.

The accompanying sections, No. 1, illustrate the detail of the reversing apparatus in the ducts, and No. 2 a detail of the openings in the auditorium chair standard bases for exhaust ventilation, immediately under the seats and above the floor level.

Mr H. W. A. Carter, of Matlock Bath, has been appointed surveyor to the Bollington Urban District Council.

WAR AND THE TIMBER TRADES.

Messrs. Denny, Mott, and Dickson, Ltd., do not offer a cheerful view of the wood market in their report for July.

Teak.—The landings in the docks in London during July consisted of fifty-one loads of logs and 291 loads of planks and scantlings, or a total of 342 loads, as against 1,063 loads for the corresponding month of last year. The deliveries into consumption were 167 loads of logs and 292 loads of planks and scantlings—together 459 loads, as against 529 loads for July, 1913.

The following is the analysis of the dock stocks at date:—

Logs—	Loads.	Loads at the same date last year.
Burma and Siam	2,213	2,217
Java	124	228
Planks and conversions—		
Burma and Siam	2,616	2,995
Java	207	317
Total	5,160	5,787

The demand has continued to be of a very meagre character, as shown by the above figures. Some development of demand may be reasonably expected as an outcome of the danger of a general European war.

Mahogany.—This market still remains depressed by the excessive supply of inferior wood, but prices have been fairly well maintained for wood of good description. The demand has been very quiet. For all descriptions during July, the landings in the docks in London were 8,126 logs, and deliveries from the docks in London were 3,585 logs, whilst the stocks in the docks are 22,093 logs.

Canadian Timber.—Waney Pine: There are very few inquiries, and stocks remain practically unaltered. Elm continues to go into consumption, and prices keep steady with the scarcity of larger-sized timber. Oak continues dull now that the railway contracts have all been placed, as there is little demand for this timber for general consumption. Spruce: Some sales have been made at reduced prices, but owing to the heavy stocks held by importers, further concessions will have to be made to tempt buyers. The demand continues quiet, consumers taking only what they actually need for their immediate requirements.

Pitch Pine.—Firmer rates are being asked by shippers, as with the cotton shipping season close at hand, tonnage is more difficult to obtain, and freights are stiffer. A shortage of sawn timber at the Gulf ports, and a disinclination of the mills to cut at present rates, give a steady tone to the market.

Oregon Pine.—A quiet demand continues, but stocks are unduly heavy in several of the U.K. markets. The very much higher c.i.f. cost of timber, however, should allow holders to reduce their stocks during the autumn.

Odessa Oak.—There has been no change in the market position during the past month. Some fresh arrivals came to hand, but went straight into consumption; consequently, stocks still remain on the moderate side, with prices firm.

Baltic and White Sea Goods.—The demand remains steady, and although there has been a sagging tendency, prices have not changed much, considering that the labour trouble still remains unsettled, and that there is no indication at the moment of any immediate settlement of the dispute. The import of fresh goods has, so far, been light, and it is satisfactory to notice that the tendency still seems to be to restrict the import.

It is difficult to form any accurate opinion of the effect if Europe becomes involved in war, although it is evident that the values of stocks in this country would rapidly improve. Shippers have made considerable sales during the past month, having shown a general disposition to meet buyers as regards prices; but, on the other hand, freights have stiffened and chartering has become more difficult, which, to a large extent, will counteract the further set-back in f.o.b. values.

Business in July lacked all brightness as a result of dwindling general trade and the political unrest at home. The month closed in profound gloom, owing to the startling development of a war crisis in Europe. Should

England become involved, the narrowing down of supplies from abroad seems inevitable, and holders of stocks here should find them increase in value as some compensation for the possibly prolonged curtailment of forward business.

OBITUARY.

We regret to record the death of Mr. John Brooke, F.R.I.B.A., ex-president of the Manchester Society of Architects, of 18, Exchange-street, Manchester, which occurred on Saturday night at his residence, The Hive, Bowden. Mr. Brooke, who was in his sixty-first year, had long enjoyed an extensive practice, not only in Manchester, but also in South-East Lancashire, Cheshire, and Derbyshire. Among the numerous buildings carried out from Mr. Brooke's designs were the residence of Mr. E. N. Galloway at Dunham Massey, Cheshire, illustrated by plan and perspective in our issue of November 8, 1889; almshouses, Welbeck, built for the Duke of Portland, and given by us, September 5, 1890; the new principal entrance-gateway and lodge at Welbeck Abbey, also carried out for his Grace, and reproduced in our pages, October 13, 1893; Congregational Church, Ashton-under-Lyne, erected at a cost of £25,000, and published by us, June 19, 1891; Stanway Manor Farmstead, near Rushbury, built for the late Mr. F. W. Webb, of Crewe, the eminent L. and N.W. Railway engineer, and shown by plan and perspective, December 18, 1891; Edinscourt House, Disley, illustrated October 13, 1893; Ollerton Grange, Knutsford, a large country residence, shown by double-page perspective and plans, November 14, 1902; and the arcade in Deansgate, Manchester, illustrated by us, January 30, 1903. He was associated with Mr. Edwin T. Hall, of Bedford-square, Bloomsbury, in carrying out the Royal Infirmary at Manchester; this institution was carried out at a cost of £400,000, from the designs of Messrs. Hall and Brooke, selected in competition, and was illustrated in our issues of April, 1, 1904; March 6, 1908; and July 9, 1909. Mr. Brooke joined the Royal Institute of British Architects as an Associate in 1881, becoming a Fellow in 1908. As president of the Manchester Society of Architects, May, 1913-14, he was a member ex-officio of the Institute Council last session, and took a warm interest in furthering the cause of Statutory Registration. The funeral service took place on Wednesday afternoon at Bowden Church.

The death occurred on Tuesday week of Mr. Edward Sharman, J.P., of Croyland Abbey, Wellingborough. Born in 1829, and educated at Leicester and Totteridge, Mr. Sharman was, early in life, articled as an architect to Mr. John Davies, who was a district surveyor in the city of London. After completing his articles and nine months' travel in Italy, Germany, and Austria, he returned to Wellingborough in 1853, and in 1854 commenced his professional career as an architect and surveyor, and founded the firm of Sharman and Archer, now carried on by Mr. J. M. Sharman, his son, and Mr. Caleb Archer, who became a partner not very long after Mr. Edward Sharman started in business. In 1856 Mr. Sharman was surveyor to the old Wellingborough Local Board of Health, and he held the office of town surveyor for forty-seven years. Amongst the public buildings in the town that he designed were the Northamptonshire Union Bank, the Capital and Counties Bank, the High-street Congregational Church, Victoria Congregational Church, Northampton-road Congregational Church, etc., with numerous mansions in the town and neighbourhood. One of the latest of his works for the town was the planning, in conjunction with his son, of the new cattle market. In 1867 Mr. Sharman acquired as a residence the property which dates back to the existence of the Abbot of Croyland—Croyland Abbey. The name is derived from the Abbot of Crowland, Lincolnshire, who established an offshoot of the monastic system at Wellingborough. The old tithe barn forming part of the temporal belongings of the Abbot of Croyland still

stands as it did in that remote period. The main structure of the abbey, purchased by Mr. Sharman, was restored and added to. In 1859 Mr. Sharman married Miss Campbell, second daughter of Mr. W. Campbell, of Tullishevan Castle, Loch Lomond, Dumbartonshire, who predeceased him some years ago. She was a cousin of the late Sir Henry Campbell-Bannerman. There are five children—Dr. Mark Sharman, of Rickmansworth; Mrs. O. A. Ellis, Leicester; Mr. Edward Sharman, Glasgow; Mr. W. Campbell Sharman, Leicester; and Mr. J. Melfut Sharman, Wellingborough. Mr. Sharman had been in failing health for some months, but it was only recently that he took to his bed. The end came about two o'clock on Tuesday week.

The death has occurred at Dene-terrace, Walbottle, of Mr. William Kirton, at the age of seventy-three. In early life Mr. Kirton was employed at the brickworks at Bell's Close, Scotswood, which were carried on by the late Mr. William Harriman and Mr. Carr. Half a century ago the late Mr. R. O. Lamb appointed Mr. Kirton manager of the brick works connected with the Walbottle Colliery, a position which Mr. Kirton held until the colliery and brickworks were closed down. Afterwards, deceased held a similar appointment at Eltringham, near Prudhoe. After nine months' sojourn there Mr. Kirton returned to Walbottle and formed a partnership with his brothers and Mr. Tarelli, of Newcastle. They restarted the colliery brickworks at Walbottle, but some years later the business was transferred. The brothers Kirton then developed the sand quarry at Sand Hills, Newburn, and also took up whinstone quarrying at Haydon Bridge. For a period Mr. Kirton was a member of the Northumberland County Council, but retired four years ago on account of failing health.

The Foundation Company of Vancouver has secured the contract for constructing a steel and concrete bridge over the Second Narrows at Vancouver, B.C., at an expenditure of 2,000,000 dollars.

A new rood-screen was dedicated in the parish church of Bradley, Staffs., on July 23 by the Ven. Archdeacon Blakeaway. It was designed by Mr. Carroll, architect, London, and executed by Messrs. Dart and Francis, Crediton, Devonshire.

The East Sussex County Council have completed arrangements for the acquisition of the land required in connection with the improvement of the Lewes-to-Newhaven road, the estimated cost of which is set down at £33,619. The road board have increased their grant to £17,619.

New works have just been completed in Cumberland-avenue, Park Royal, Willesden, for Messrs. Henry Simons and Co., fire-engine and appliance manufacturers. The builders were Messrs. Walter Jones and Sons, of Old Queen-street, Westminster, and Mr. Walter Pamphilon, L.R.I.B.A., of Finsbury-pavement, E.C., is the architect.

Mr. A. W. Brightmore, D.Sc., M.Inst.C.E., an inspector of the Local Government Board, held an inquiry at the offices of the Maidstone Rural District Council on Friday into the application of that body for power to borrow £3,000 for the erection of a new bridge at Wateringbury. The plans were explained by the engineer, Mr. R. H. Halls, of Lewes.

Mr. H. S. Bilwell, Local Government Board inspector, held an inquiry at the Town Hall, Kirton, on the 23rd ult., concerning an application by the Boston Rural District Council for sanction to borrow £8,340 for the purpose of schemes under part 3 of the Housing of the Working Classes Act, 1890, for the purchase of land and the erection of working-class dwellings in the parishes of Wrangle, Freiston, Pelham's Lands, Kirton, Frampton, Sutterton, Wigtoft, and Alzarkirk respectively.

The total quantity of Canadian Portland cement sold in 1912 was 7,132,732 barrels (1,248,228 tons), as compared with 5,692,915 barrels (996,260 tons) in 1911, an increase of 1,439,817 barrels, or over 25 per cent. The total consumption of Portland cement in 1912, including Canadian and imported cement, was 8,567,145 barrels of 350lb. net each, as compared with 6,354,831 barrels in the previous year, being an increase of 2,212,314, or nearly 35 per cent., according to statistics issued recently from the Department of Canadian Mines.

Engineering Notes.

OGDEN POINT, BRITISH COLUMBIA.—According to the engineer's statistics, the weight of granite blocks laid since the commencement of operations on the construction of the Ogden Point breakwater, B.C., amounts to 3,677 tons. In June 2,000 tons of granite were placed in position by the divers. The work is carried out by means of a powerful steam crane operated from a big scow, and all the granite being used in the breakwater construction is procured from Hardy Island. The work is so far advanced by the contractors, Sir John Jackson, Limited, of Plymouth, that operations were started in July on the concrete work forming the superstructure of the great sea-wall. The Associated Cement Company, of Bamberton, who are the contractors for the cement, have delivered 1,250 barrels on the site. Before use it is to undergo a twenty-eight-day test. The total amount of rubble dumped to the end of June is placed at 373,608 tons. The width of the base of the foundation is 200ft., tapering to a height of 72ft.

QUEBEC.—Work is progressing steadily on the construction of the new Quebec bridge at Neilsonville, Quebec, which will replace the half-built structure which suddenly collapsed in August, 1907. The firm of Messrs. M. B. and J. T. Davis have completed the construction of the granite piers, eight in number. The main piers are 90ft. below water-level and 28ft. above, making a total height of 118ft. The anchor piers are each 160ft. high, with dimensions of 75 by 30ft. at the bottom. It is expected that Messrs. Davis will complete their part of the contract by the end of this autumn. The main portion of the structure, the actual building of the bridge, is in the hands of the St. Lawrence Bridge Works Company. They are making rapid progress in arranging a special plant in the vicinity of the work. This includes an overhead crane of seventy-five tons capacity, operated by electricity, and supported on steel pillars. The approach spans to the bridge, with the exception of the sidewalks, have already been completed, while the anchor arms are at present being built. The bridge proper is of the cantilever and suspended centre-span type, the distance between the centres of the piers being 1,800ft. The suspended span is 640ft. long, which is believed to be the longest centre span in the world. The length of each of the anchor arms is 515ft., while the total length of the bridge, including approaches, will be 3,230ft. The height from high-water level to the top of the main posts is 344ft., and the clear height from the high water level to the suspended span is 150ft. The width of the bridge from centre to centre is 88ft. The centre span is to be constructed entirely of nickel steel, to conserve weight. Each of the cantilevers will be erected as an entirely separate structure, with its individual erection equipment.

A sum of £11,344 was left by Mr. Samuel Dyer, china clay merchant of Trethenal, St Austell.

The parish church of Kemington, near Ashford, East Kent, is about to be restored at an estimated cost of £600.

The Urban District Council of Bedwas and Machen have appointed their surveyor Mr. A. S. V. Taylor, as architect for the Machen housing scheme, and the clerk has been instructed to negotiate with the Heath estate for two acres of land on the Ysgubor Fawr Farm.

Mr. Edward Harold Ferrabee has been appointed as assistant surveyor for the Uttoxeter district, and his duties commenced on the 6th ult., his commencing salary being £175 per annum, rising by the increments mentioned in the resolution passed by the Staffordshire County Council on March 10 last.

An inquiry was held at Stroud on July 29 by Mr. W. O. E. Meade King, an inspector of the Local Government Board, with reference to an application by the urban district council for sanction to borrow £1,650 for additions to the swimming baths and stabling accommodation for steam roller. There was no opposition.

Building Intelligence.

DURHAM.—At the last meeting of the Durham County Council the education committee reported that they had passed estimates for the next quarter showing that £154,115 would be needed for elementary and £21,100 for higher education. They recommended that the seal of the council be affixed to contracts for building new schools at Blackhall Mill (cost £8,019) and Bishop Auckland (£1,117); for alterations and extensions at Ferryhill Station (cost £4,317), Emmaville (£1,055), Tudhoe Colliery (£1,379), East Hetton (£3,243), Spennymoor Higher Education (£4,389), and Newbottle (£2,997); and for conveyances of Newton Cap council school and site, land adjoining Newton Cap school, Barnard Castle school site, Easington-lane school site, and Station Town council school and site, and for the surrender of the Woodland school and site. They recommended the provision of new schools at Birtley (estimated cost £9,960), Newfield (£2,850), Edmondsley (£5,726), Pelton Fell (£3,960), West Pelton (£8,798), Bewicke Main (£1,500), and Witton Gilbert (£4,250). Plans for the new Bishop Auckland Grammar School were under consideration by the Board of Education. The proposal to build a new school at Edmondsley was referred back.

MANCHESTER DIOCESE. Chancellor Philip Vernon Smith held a consistory court the other day in the vestry of Manchester Cathedral. Faculties were decreed in the following, among other, cases:—St. Andrew, Oldham, a parish room on the south-east side of the church; St. Paul, Westleigh, for the erection of a new organ; St. George, Abbey Hey, to erect an oak reredos on shelf to take the place of the present curtains at the east end of the church; St. Thomas's, Bradford, to paint the apse walls, erect a carved oak reredos with panels, and insert stained glass in the windows of the apse, and to raise the church floor at the west end; St. John the Baptist, Heaton Mersey, to provide a new organ; Prestwich (St. Mary), to install electric light in the place of gas; St. Stephen, Audenshaw, to insert stained glass in the east windows; Eccles (St. Mary), to install electric light; St. Mary, Hulme, to insert stained glass in west window; St. Katharine, Blackrod, to erect and furnish a chapel on the south side of the chancel with stone screen in the arches between the new chapel and the chancel and the south aisle of the nave; St. Anne's, Lancaster, to remove side galleries on the north and south and reduce the depth from back to front of the west gallery.

NEW BRIDGE STREET, E.C.—New premises are being built for Messrs. Spicer Brothers at the south western corner of New Bridge-street, near the Embankment. Of the seven stories in height, three floors will be occupied by Messrs. Spicer, and the remaining offices, numbering 180 in all, will be let. The buildings will be equipped with four electric lifts, and a hot- and cold-water system. The flat roof will be fitted up as a roof garden. Steel and concrete alone will be used in the building, and the structure will rest on concrete piles, this being the first occasion on which the latter have been used in the City. Three sides will be faced with Donlon's Carrara. The total cost will be close upon £80,000. The architect is Mr. F. W. Troup, F.R.I.B.A., of Gray's Inn-square.

ROCHDALE. The Primitive Methodists of Jarvis-street, Rochdale, have in hand a scheme of improvements and extensions. Their existing school chapel is to be re-fronted, re-decorated, and re-furnished, and at the front there is to be an attractive tower and spire. This part of the premises will then be used exclusively for the public services. A new school is being erected at the rear of the existing building, and four new classrooms are also to be built. This work is being carried out according to plans prepared by Mr. H. Harper, architect, of Nottingham; the firm of W. H. Ashworth, of Deepdish, being the contractors. It is estimated that the expenditure will amount to about £1,400.

Stone laying ceremony was held last Saturday afternoon.—Plans for the extension of the Rochdale Technical School by the addition of rooms for the accommodation of cotton-spinning machinery have been approved by the Board of Education, and tenders will be invited shortly. The whole of the plant necessary to equip the extension has been promised, free of cost, by local firms. The extension will be carried down Church-lane from the existing premises to a point adjoining the hotel, and will involve the demolition of an old shop there. Architecturally it will be in keeping with the original building, being a free treatment of the Renaissance style. In the basement provision is being made for a heat engines laboratory; the first and second floors will be devoted to the accommodation of cotton-spinning machinery; and the top floor will be used as a plumber's shop. All the three floors are to be connected with the corridors of the existing school. Electric lighting will be installed, and the plant will be driven by separate motors. The extension will cost about £3,500. The plans have been drawn by Mr. Percy W. Hathaway, A.R.I.B.A., of the town hall, Rochdale, the borough architect.

WHITLINGHAM, NEAR NORWICH.—Recently the Sewerage Committee of the Norwich Corporation have completed six workmen's dwellings at the sewage farm at Whitlingham, built to the designs and under the supervision of the city's engineer, Mr. A. E. Collins, assisted by Mr. Lancelot H. Keay, his chief architectural assistant. Wherever possible, local materials were used in their construction. The concrete blocks were made on the spot with sand and gravel raised on the farm. The roof ridge and gable tiles and quoin bricks were obtained from Rockland. In the smaller cottages the living rooms are 14ft. 6in. by 10ft., parlour 14ft. by 11ft., one bedroom 14ft. by 11ft., one 8ft. 6in. by 10ft., one 8ft. by 7ft. 6in., scullery 6ft. 6in. by 9ft., containing bath, slop sink, water supply, and clothes boiler. There is also to each house ventilated food-pantry, coal-store, w.c., rain-water butt, and tool-shed. The ground floor rooms are 8ft. high, and the bedrooms 8ft. 6in. The yards at rear are concreted; there are complete water supplies and sewerage to each house. The end cottages are somewhat larger, having an additional bedroom 14ft. by 10ft. The walls of the dwellings are hollow, consisting of two distinct walls of concrete each 4½in. thick, with 2½in. cavity. The two walls are bonded together by iron ties; the lintels consist of tiles and reinforced concrete. The houses were built by Messrs. Podd and Fisher, Norwich.

Swansea Town Council last Friday decided to extend the borough boundaries by taking in Mumbles, Bryan, Llanamlet, Cockett, and portions of Clase and Pendery districts. This will give an added acreage of 17,964 acres, and will make the borough three times as large as at present. Its existing area is 6,195 acres. The present population of 120,000 will be increased by 29,000. The council also decided to proceed with a comprehensive drainage scheme, involving an outlay of £344,000.

The total length of sewers constructed up to the date of the Rivers Committee report, March 31, under the Manchester Corporation Act, 1911, and completed to date is 127 miles, of which 253 miles were executed by the committee staff, without the intervention of a contractor. The sewers vary in size from 2ft. to 15ft. in diameter. They are composed of red engineering bricks and shale bricks set in cement mortar. No surface clay bricks have been used.

At the meeting of the Holywell Rural District Council on Friday a communication was submitted from the Flintshire County Council enclosing a report of the county architect and medical officer on the proposal to erect an isolation hospital for the county, or such districts as are not yet provided for in this respect. Particulars were furnished of the alternative schemes, varying in cost from £17,000 to £15,000, the cost per bed varying between £450 and £550. The districts to be provided for would be Holywell, Flint, Mold, and Connah's Quay. It was decided to further consider the matter at a future meeting.

Our Illustrations.

ROYAL EXCHANGE, CALCUTTA. (SELECTED DESIGN.)

The Exchange Building at Calcutta is to be erected at the junction of Clive-street and New China Bazaar-street. Its design is severe Classic with a Corinthian colonnade between plain end pavilions. The building contains a general exchange hall, European and native bookers' exchange rooms, an arbitration room and post office, with the necessary amenities on the ground floor. On the mezzanine floor there are reading and committee rooms, restaurant and arbitration rooms, with dressing rooms and lavatory accommodation. On the first floor there is a large hall for the Calcutta Chamber of Commerce, with various committee rooms and offices. On the second floor there are offices for the Chamber of Commerce and suites to be let off with the necessary lavatory accommodation. Messrs. Stevens and Gregson and Co., of Bombay, Calcutta, Rangoon, and 32, Victoria-street, S.W., are the architects. We printed a notice of the competition in the BUILDING NEWS for May 22 last, after the award by Mr. John Begg, F.R.I.B.A., consulting architect to the Government of India, had been published.

THE DEPARTMENT OF APPLIED SCIENCE, UNIVERSITY OF SHEFFIELD.

This department is situated a quarter of a mile from the main University buildings, and is managed by a sub-committee of the University, with a separate secretary and clerical staff, subject to the general jurisdiction of the University Council. It was founded in 1884 as a department of Firth College, Sheffield. From 1890 to 1897 it became an independent technical school. It was afterwards incorporated and absorbed by the University College, now the University of Sheffield. Its special function is theoretical and practical instruction in the science underlying the staple trades of Sheffield, and special departments are devoted to the metallurgy of the steel and silver industries, mechanical, electrical, civil and mining engineering, building construction, and geology. The engineering, metallurgical, and steel plant is considered one of the most complete and efficient of its kind in the world. On the site, previous to this extension, the buildings occupied 2,834 superficial yards, and contained engine and boiler room, engineering workshops with machinery and tools, electrical laboratories, steel laboratories, furnaces, etc., building construction, workshop, and numerous lecture and class rooms. The present extension is four stories high, and the buildings occupy 1,571 superficial yards; it completes the main façade to St. George's-square, making it 330ft. in length, besides the return elevation in Portobello-street, thus enclosing three sides of the quadrangle and leaving the fourth, next Broad-lane, for still future extension. Accrington red pressed bricks are used for the exterior, with Huddersfield stone dressings. The new buildings contain, on the upper ground floor, the central entrance doorway, with inner hall and main staircase, the walls of which are lined with buff brick and enriched with Huddersfield stone columns, pilasters, cornices, etc. This floor also contains the library, a room 32ft. by 25ft., fitted from floor to ceiling with oak book cupboards, shelves, etc., also the general cloakroom and porter's office, and lecture rooms for the metallurgical department. On the first floor and opposite the main staircase is the Mappin Hall, a room 72ft. by 33ft. by 24ft. high. The walls are covered with richly-moulded oak panelling, 18ft. high, with carving judiciously introduced, and the floor is of oak boarding in narrow widths. The ceiling is of fibrous plaster with enriched mouldings, and elliptical in section. This hall is lighted by three large three-light windows, glazed with painted leaded-glass, and containing the Arms of the University, the City, and the Drapers Company of London. The remainder

of the first and the whole of the second floor contains the Mining Department; the third floor the Geological Department, and in the basement are rooms of the Metallurgical and Electrical Departments. The heating and ventilation of the laboratories is by Ibbotson's patent air-washing Plenum apparatus, the cleaned air being heated and then propelled along glazed brick-ducts and delivered 7ft. 6in. above the floor, the outlet flues being placed near the floor and ceiling. The other rooms have fresh air admitted through ventilating radiators and extracted by flues in the walls connected to ventilating turrets on the roof. Generally the heating is by low pressure hot-water pipes and radiators. The architects were Messrs. Gibbs, Flockton, and Teather, of St. James's-row, Sheffield, and the total cost of this extension was about £44,000.

BLACKBURN WESLEYAN MISSION BUILDINGS.

A site in the centre of Blackburn is to be cleared for these buildings, for which Messrs. Bradshaw, Gass, and Hope, of Bolton, were appointed architects after a limited competition, in which Sir Alfred Gelder was the assessor. The whole of the lower floor is to be used for Sunday school and institutional purposes, with a large hall on the first floor to seat 1,600 persons. Many vestries are also arranged and available for general use. The buildings are to be fire-proof throughout, and externally red brick and stone will be used. It is proposed to commence erection of the buildings at an early date, and the working drawings are now in progress. We give the two chief floor plans, also an exterior view, as well as a sketch of the great auditorium.

The Urban District Council of Romford are purchasing properties in the Market-place and South-street, in order to carry out improvement works. The cost of the properties to be acquired will be £3,300.

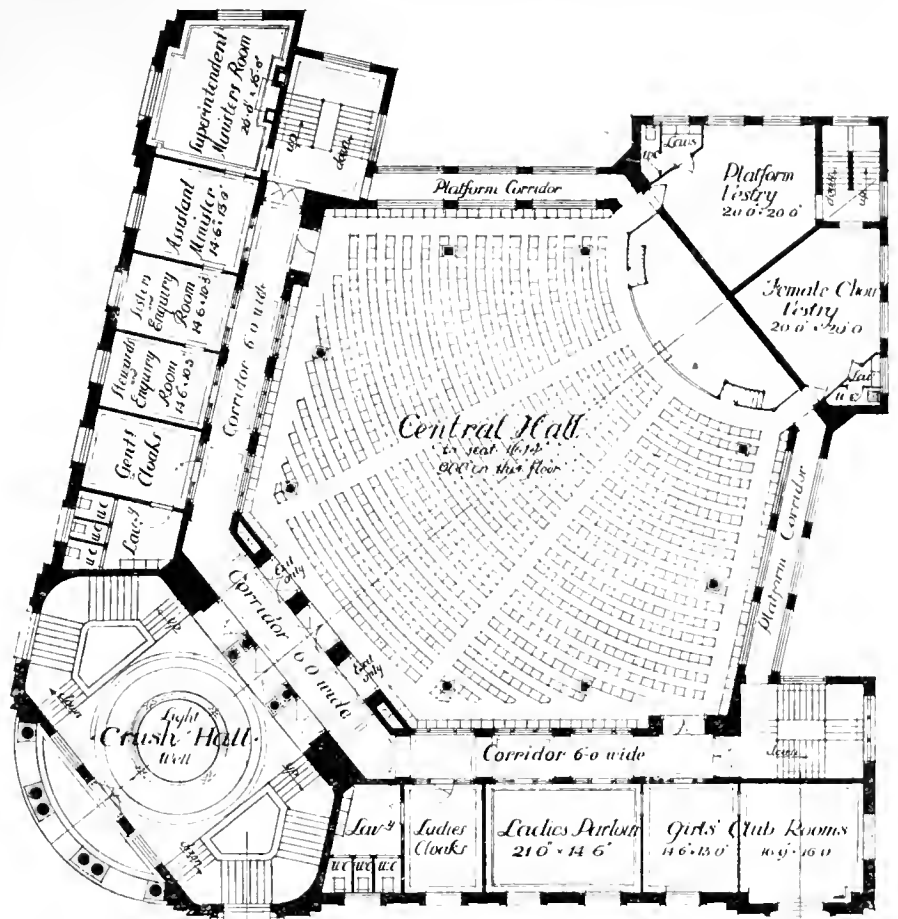

A new school, in two departments, accommodating 500 children, is about to be built in Lower-place, Oldham-road, Rochdale, from plans by Mr. P. W. Hathaway, the borough architect. It will provide two central halls and ten classrooms.

The interesting twelfth century village church of Preston, near Faversham, is about to be restored at a cost of some £1,000 from plans by Mr. W. D. Caroe, F.S.A. The nave roof will be largely rebuilt, and that over the south aisle will be entirely replaced.

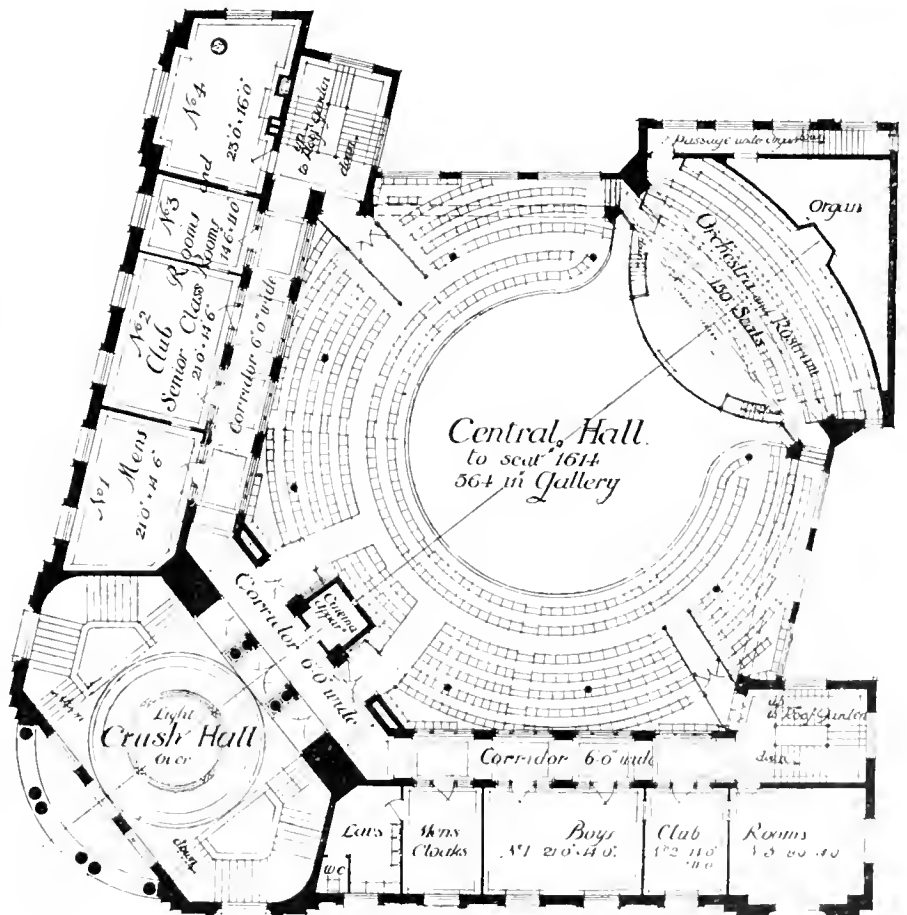

It was reported to the Looe Harbour Commissioners at their last meeting that Mr. Lewis, of the firm of Messrs. Douglass, Lewis, and Douglas, civil engineers, Westminster, had visited Looe and gone carefully into the proposed alterations to the harbour. Their plans and specifications would shortly be delivered.

The harbour at Fraserburgh, N.B., has just been extended and deepened at a cost of about £200,000. A new basin with a centre area of eleven acres has been constructed, and two piers of concrete, 282ft. and 262ft. in length respectively, thrown out. Mr. G. N. Abernethy, of Westminster, was the engineer.

The application of the Lincoln City Council to the Local Government Board for authority to prepare a town planning scheme was the subject of an inquiry by one of the board's inspectors, Mr. George L. Pepler, F.S.I., at the Guildhall, Lincoln, last week. The Town Clerk stated that the area of the city was 3,755 acres, and the population, according to the census of 1911, was 57,285. The population increased from 1891 to 1901 by 7,293, representing a percentage of 17.6, and for the following ten years the increase was 8,501, or a percentage of 17.4. It followed that undeveloped land in the city would be required for development, and it was very necessary that the corporation should exercise control over the method of the development, and that could only be accomplished by means of a town-planning scheme. Accordingly, they made application to the Local Government Board for permission to borrow the purchase money, and they had every reason to believe that their application would be acceded to. Between the selected site and Nettleham-road there was an area of something like 140 acres, now agricultural land, and the corporation had every reason to believe that their housing proposals would have the effect of opening up this land for development.

COMPETITIONS.

"OWEN JONES" PRIZES.—The council of the Royal Society of Arts hold a sum of £400, the balance of the subscriptions to the Owen Jones Memorial Fund, presented to them by the committee of that fund in 1876, on condition that the interest thereof be spent in prizes to "students of schools of art, who, in annual competition, produce the best designs for household furniture, carpets, wall-papers, and hangings, damasks, chintzes, etc., regulated by the principles laid down by Owen Jones." The next award will be made in 1915, when six prizes are offered for competition, each prize to consist of a bound copy of "The Leading Principles in Composition of Ornament of Every Period," from the "Grammar of Ornament," by Owen Jones, and the Society's Bronze Medal. Designs submitted for these prizes must be sent in with the other works forwarded for the National Competition. No candidate who has gained one of the above prizes can again take part in the competition.

FEDERAL PARLIAMENT HOUSE, CANBERRA.—The conditions for this highly-important international competition have just been published by the Commonwealth Department of Home Affairs, and may be obtained of the Director of Design and Construction, 151, Collins-street, Melbourne, and of the High Commissioner for Australia in London. We mentioned, in our issue of the 17th ult., p. 73, that eight premiums are offered, aggregating £6,000, the first being £2,000, in addition to the usual commission on the R.I.B.A. scale. Sir J. J. Burnet, Mr. G. T. Poole, of Australia, M. Victor Laloux, of Paris, Herr Otto Wagner, of Vienna, and Mr. Louis H. Sullivan, of Chicago, are the jury of architects. Only tentative sketch outline designs are to be submitted, and alternative designs are prohibited. The drawings must be executed with pencil or pen, without wash or colours, and to be cloth-mounted or stretched. Only six sets of drawings must be submitted, of which five—plan of each floor of Parliament House, longitudinal section, transverse section, and three elevations, and perspective from division of terrace east of the reservoir—are to be to a scale of 1-16in. per foot; the sixth is to be a detail of one architectural feature of the building—selection optional. A brief description in print, or typewritten, unsigned, must accompany the drawings, including a statement of the total value of the ultimate building in tens of cubic feet. The designs are to be submitted anonymously, with accompanying sealed packet giving name and address of author or authors, and delivered to the Federal Capital Director of Design and Construction, Melbourne, Australia, or to the High Commissioner of Australia in London, on or before March 31, 1915. The designs will be exhibited free to the public after the adjudication. The winning design will become the property of the Government, and all other designs will be returned, freight paid, to the competitors. The Government will employ the competitor placed first by the jury as architect for the initial portion of the building, and so far as the subsequent stages of the ultimate building are concerned, it is the intention of the Government similarly to employ him. Should the architect be required to give personal supervision to the building, his remuneration will be in accordance with the R.I.B.A. schedule of charges as at the date of the first publication of the programme, and otherwise he will be paid at the rate of 3 per cent. on the actual outlay. The site is a virgin one, under unified control, and it is desired that "the standard of design be the expression of actual proportions through practical organic planning . . . avoiding the intrusion of irrelevant features on the one hand, or individual on the other, and thorough recognition of the peculiar site conditions." The ultimate cost of the Parliament House is to be within £1,000,000, and that of the initial or necessary portion must not exceed £250,000. Two views of the absolutely unoccupied site of Canberra, from paintings by W. Lister Lister and Penleigh Bond, a general block plan, and elevations and

sections of the site, and of the group, and a preliminary perspective and coloured plan of the extended city, form useful adjuncts to the pamphlet of conditions.

PROFESSIONAL AND TRADE SOCIETIES.

MANCHESTER UNIVERSITY.—Faculty of Technology.—The prospectus of courses in the Municipal School of Technology for the session 1914-15 has reached us. In the section devoted to architecture and building construction, Mr. Archibald C. Dickie, M.A. (Manchester), A.R.I.B.A., is professor of architecture in the University, and in the School of Technology; Mr. W. Leicester, M.S.A., is lecturer in building construction in the University and in the School of Technology; and Mr. J. Lindsay Grant is demonstrator in architectural drawing and design in the University. Candidates are required to present certificates of having attended approved courses in building construction (4), building surveying (6), history of architecture (2), drawing (9), sanitary engineering (1), and architectural design (18). The examination will consist of two parts, of which Part I. may be taken at the end of the second year and Part II. at the end of the third year, or both parts may be taken together at the end of the third year. Part I. includes four papers in:—1, general history of architecture; 2, architecture (special); 3, building construction; 4, sanitation. Part II. consists of three papers in:—5, History of art; 6, architectural history (special); 7, advanced building construction; together with a thesis (design with memoir) and survey of a building with memoir. Students, who have completed the intermediate course for the Honours School in Architecture in the Faculty of Arts, are allowed to proceed to the degree of B.Sc.Tech. in architecture, provided that they pass the intermediate examination in the science subject of the intermediate (which they have not already taken), that is to say, in physics, inorganic chemistry, or mathematics, as the case may be.

NORTHERN ARCHITECTURAL ASSOCIATION.—The annual excursion of the Northern Architectural Association took place on the 29th ult., the members leaving Newcastle for Carlisle, where a series of visits had been arranged. Among those travelling were Mr. R. Burns Dick, the president; Mr. C. S. Errington, vice-president; Mr. J. Bruce, hon. librarian; Mr. H. L. Hicks, hon. secretary; Mr. G. T. Brown, Mr. E. E. Dotchin, Mr. M. G. Martinson, Mr. A. B. Plummer, and Mr. A. K. Tasker, members of council; Mr. J. Hall, hon. local secretary for Sunderland; Mr. J. W. Dyson, and Mr. T. J. Peters. The visits were to Rose Castle and the Cathedral and Castle at Carlisle. The Cumberland architects had been invited to take part in the proceedings. In connection with the visit, an invitation was given to the Cumberland district to join the Northern Architectural Association. It was explained that recently, as an allied society of the Royal Institute of British Architects, the association had had its boundaries extended so as to embrace the Cumberland district. What was wanted was a real extension of their domains, and until the Carlisle men co-operated, the association could hardly be said to be fulfilling its functions. The arrangements for the visit at Carlisle were carried out by Mr. Oliver, architect.

R.I.B.A. PROBLEMS IN DESIGN.—The designs submitted under Subject XV. will be on view in the rooms of the R.I.B.A. on August 10, 11, and 12, inclusive, between the hours of 10 a.m. and 6 p.m.

Mr. E. S. Rider has been elected Master of the Joiners' Company, and Mr. F. L. Wiginton and Mr. J. R. Bedford wardens.

The salary of Mr. Edwards, water engineer to the corporation of Leicester, has been increased by £150 per annum.

The Departmental Committee on Smoke Abatement have adjourned sine die. Due notice will be given of the date when the committee resume their meetings.

Correspondence.

TIMBER PRICES.

To the Editor of the BUILDING NEWS.

SIR,—In your "Answers to Correspondents" in a recent issue I notice that one of your readers has taken exception to the price quoted for joiners' deals, and you replied that you were unable to find any error in the prices, after comparison with current sales, as reported in the principal timber trades journal.

I personally noticed these extremely low prices, and feel that a little explanation should be given, so that architects are not misled in basing their estimates upon wrong prices.

I can quite understand that anyone perusing the trade journals, and noticing the prices there, might think these were the current prices that the builder paid; but in my experience of between two and three thousand builders, I only know of one provincial builder who buys at the London sales, the report of which these timber trade journals' prices are.

It is a fact that few builders have cash to place down for timber stocks, nor have they the time to spend in journeying up to London on the off-chance of buying a job lot of deals, because it means going on to the docks to see them on the day preceding the sale, and then attending the sale to buy, and if the prices went high, then the builder would have his two days' time and expenses thrown away, so that you can see that it would not do for builders to buy at the London sales.

There is another point to consider in these prices, and that is that these sales are intended for the merchant, and I think I am right in saying that builders are not knowingly supplied. The reason that the prices there named are so very much below the merchant's prices are: (1) Because there are sometimes heavy lighterage charges, and always cartage and railway expenses, before the merchant or builder can stock the timber in his yard. (2) If the goods are left at the dock until required, there are very heavy dock dues and rents. In the latter connection, I may say that twelve years ago, when I bought my business, in taking over the stock, there was a matter of 1,000 bundles of ceiling laths omitted from the stock list. Probably two years after, the dock company wrote and said that these laths were lying there, and the rent had nearly eaten up the cost of them. In fact, that was so, because we sold the laths to pay the rent, and the widow of my predecessor did not receive a penny for the laths, so that you can quite understand that the expenses at the London docks are very heavy indeed. Allowance must, therefore, be made for not only a merchant's expenses as detailed above, but for merchants' profit and builders' profit.—I am, etc.,

J. H. KERNER GREENWOOD.

King's Lynn.

THE METROPOLITAN WATER BOARD AND TERRITORIAL AND OTHER RESERVE FORCES.

SIR,—I have the pleasure to inform you that the board, at a special meeting held to-day, passed the following resolution:

"That any officer or servant of the board who, as a member of the Territorial or other Reserve (Naval or Military) Forces of the Crown, may be affected by the mobilisation or embodiment consequent on the present European crisis, be allowed leave of absence during his naval or military service; that he be reinstated on his return with no loss of position or emoluments consequent on his enforced absence; that the board pay him or such other person or persons as he may appoint) during such period such sums, as with the pay he receives from the Government, will make up his full salary or wages; and further, that the respective committees be authorised to make such temporary arrangements as may be necessary for carry-

ing on the work of such officers and servants in their absence."—I am, yours faithfully,

A. B. PILLING, Clerk of the Board.

"Metropolitan Water Board (Clerk's Department), Savoy Court, Strand, W.C.
"August 4, 1914."

SCOTTISH BUILDERS AND MEASUREMENTS OF CARPENTERS' AND JOINERS' WORK.

SIR.—In view of the deadlock which has recently arisen through the attempt on the part of the Western District Wrights' Section of the Scottish National Building Trades Federation to impose, throughout the West of Scotland, a new Mode of Measurement of Wright Work, which has not been approved by this Institute, or by any of the other parties concerned, excepting the Federation, my Council has instructed me to prepare, for the information of the members, the following résumé of the course of events which has led up to the present unsatisfactory state of affairs.

When the Scottish National Building Trades Federation was recently instituted, the Council of this Institute was prepared to welcome the establishment of a central representative body of contractors with which the architectural societies could co-operate for the discussion and adjustment not only of conditions of contract and modes of measurement, but, generally, of all matters connected with the various building trades; and as it was understood that the general feeling of the Federation was that all such questions should be dealt with on a distinctly national basis, the Council was further encouraged to support the Federation in the accomplishment of its aims. Negotiations were accordingly entered into between the Federation, the Faculty of Surveyors, and the various architectural societies for the preparation of new conditions of contract, and friendly relations were soon established. At the various meetings which took place satisfactory progress was made in adjusting these conditions, of which a draft had been prepared by the Federation for discussion; but of late this progress has not continued.

An endeavour was also made to open negotiations with a view to the formulation of uniform modes of measurement, and a conference was held in Edinburgh on February 6 last, at which, however, no representative of the Institute could be present. From a report of the conference communicated by the secretary of the Federation, the Institute learned that the meeting was unanimous in the desire that such uniform modes should be adopted, but that there was some difficulty in arranging as to the mode of procedure. The members of the Federation suggested that the mode of procedure should be by way of joint considerations in conference between the representatives of the architects, the surveyors, and the Federation, and that a conference should be instituted of four representatives of the faculty and the Federation, and one representative architect from Edinburgh, Glasgow, Aberdeen, Dundee, and Perth.

This proposal was quite acceptable to the Institute, but the proposed conference, so far as I am aware, never met, owing, it is understood, to the position taken up by the Faculty, which claimed to reserve to itself the right of preparing modes of measurement. In any case, nothing further was heard of any movement on the part of the Federation relative to the preparation of new modes for any of the trades until April 15, when the Secretary of the Federation issued a circular to the members of the profession informing them that, at a large and representative meeting of the Western District Wrights' Section of the Federation, held within the City Hall, Glasgow, on the 2nd inst., the following resolution was unanimously agreed to, viz.: "That this meeting of master wrights of Glasgow and the West of Scotland (and forming the Western District Wrights' Section of the Scottish National Building Trades Federation) resolve that on and after July 1, 1914, the

regulations for the measurement of wright work known as the 'Glasgow Mode of Measurement, 1894,' shall no longer be in force or recognised by them, and thereafter they shall only contract under schedules prepared in terms of the conditions of contract and in accordance with the mode of measurement known as the 'Scottish Mode of Measurement, 1914,' as adopted and approved of by the Scottish National Building Trades Federation—the schedules being endorsed 'Scottish Mode of Measurement, 1914.'"

This circular was brought up for consideration at the first meeting of the Practice Committee of the Institute, held on April 22, and it was agreed that, before deciding on any action, to ascertain from the Faculty the attitude they were prepared to take up. In response to this inquiry, a deputation from the Faculty was received by the committee at a meeting held specially for that purpose on May 1, when it was found that the Faculty had done nothing towards the preparation of a new mode of measurement of wright work, and that they were of opinion that no progress would be made until the question of the supply of scaffolding planks had been officially disposed of. The committee declined to admit this as a valid excuse for delay, and in order, however, to clear the way for progress undertaken, on behalf of the Institute, to adjust the matter at once with the various trades concerned, the deputation at the same time undertaking on behalf of the faculty to proceed with the preparation of a new mode immediately the question had been settled.

Meetings with the representatives of the various trades were thereafter held, with the result that all the trades except the plasterers agreed to accept the recommendation of the Institute that each should supply their own scaffolding planks. These negotiations naturally required some time, and it was only at a meeting of the Practice Committee held on June 11, that the representatives appointed to deal with the matter could report that the question had been finally disposed of. It should here be added that the plasterers, at a later date, agreed to fall into line with the other contractors. While these negotiations were in progress, the convenor of the Practice Committee had, on June 4, written to the Secretary of the Federation informing him of the position, and asking that the Federation should consider the postponement of the new mode until a mode had been prepared which might be acceptable to all parties concerned, and a reply, dated the 8th ultimo, had been received, in which the Federation simply reaffirmed the position it had taken up.

Notwithstanding the unaccommodating nature of this reply, the committee resolved to again approach the Federation with a view to some settlement being arrived at, and representatives were appointed to meet representatives of the Edinburgh Architectural Association and the Faculty of Surveyors. These representatives accordingly met on the 15th ultimo, and a joint letter was addressed to the Federation, again requesting that the new mode should be postponed meantime, and that a small committee should be appointed to meet a similar committee of the architects and surveyors. To this joint letter the Secretary of the Federation replied on the 29th ultimo "that, while the Federation cannot for a moment consider the question of withdrawing the resolution referred to, they are prepared to appoint a small committee to meet authorised representatives of the architectural societies and the faculty of surveyors," adding, "meantime, it must be understood that the mode of measurement issued by the Federation shall stand until any amendments that may be found necessary are adopted."

The Practice Committee met on the 1st inst. to consider this reply, and after a full discussion on the whole situation, it was unanimously agreed that no good purpose would be served by continuing negotiations with a body which met all attempts at conciliation by the Institute in such an ungenerous and inconsiderate spirit as had been displayed in the present instance, and it was

decided to recommend the Institute to again affirm its position with regard to the preparation of new Modes of Measurement—viz., that all such modes must, before being put into force, be discussed, adjusted, and approved by the architects, the surveyors, and the contractors; to decline, therefore, to recognise the new Modes for Measurement prepared by the Federation, and to advise the members, the Federation, and all others concerned accordingly.

A special meeting of the members of the Institute was held on the 8th inst., and after the position had been explained and discussed, it was unanimously decided to adopt the recommendation of the Practice Committee as the only course open to the Institute under the circumstances. It was resolved, however, as a last effort towards an amicable solution of the difficulty, to ask the Federation to confer with representatives of the Institute in order that the situation might be further discussed.

The Federation acceded to this request, and the Institute representatives, together with the representatives of the Edinburgh Architectural Association, met the Federation in a conference in Edinburgh on the 13th inst. No practicable basis of agreement could, however, be discovered, as the Federation would agree to nothing short of an immediate acceptance of their Mode of Measurement. At the conclusion of the conference the Institute representatives submitted a proposal that, if the Federation would agree to a postponement of their Mode for three months, the Institute would undertake to have the details of a new mode adjusted with all the parties interested within that period; but as the Federation refused to entertain this proposal, the conference, after sitting for three hours, terminated without having discovered any grounds upon which an agreement could be arrived at.

The result of the conference was reported by the Institute representatives to a meeting of the Practice Committee held on the 15th inst., and it was then decided to inform the Federation that, in consequence of their action on this question, the Institute felt that no good purpose would be served by continuing the connection, and to intimate that, unless and until a more reasonable attitude and a more accommodating disposition was displayed on the part of the Federation, the Institute must decline to proceed further in the negotiations they have entered into, not only with regard to the new Mode of Measurement, but also with regard to the new Conditions of Contract.

From the foregoing statement my Council trusts the members will recognise that no efforts have been spared on the part of the Institute to bring about an amicable settlement of the difficulty; but it regrets that, so far, its efforts in that direction have proved unavailing. Had the parties most intimately concerned in the drawing up of a new Mode of Measurement—viz., the Faculty and the Federation found it possible to approach the negotiations in a broader spirit of mutual respect and consideration, my Council can see no reason why a settlement satisfactory to all parties concerned should not have been arrived at; and, as they are firmly convinced that a lasting settlement can only be attained on the basis of an agreed settlement, they feel that the only course open to the Institute is to continue their efforts until such a settlement has been reached.

Meantime I am instructed to advise the members that the Council expects them, individually and collectively, to do their utmost to uphold the position the Institute has taken up, and to refrain from using the Scottish Mode of Measurement, 1914, for Carpenter and Joiner Work, as issued by the Federation.

In name, and on behalf of the Council,

C. J. MACLEAN, Secretary.
Glasgow Institute of Architects, 115, St. Vincent-street, Glasgow.
July 31, 1914.

It is proposed to acquire Highbury, his Birmingham residence, as a permanent national memorial to Mr. Chamberlain

LEGAL INTELLIGENCE.

MINERALS AND SITE VALUE.—FORAN v. THE ATTORNEY-GENERAL.—A question arising on Form IV, under the Finance Act, 1910, with reference to minerals site value, and increment duty, was discussed before Mr. Justice Warrington in the Chancery Division on July 30, on an action by Canon William Francis Foran and Mr. Herbert Scott Cartwright, trustees of a settlement comprising a property called Appleton Farm, near Dover, against the Attorney-General as representing the Inland Revenue. Plaintiffs asked to have it declared that the notice and Form IV, served on the trustees in 1910 were unauthorised and void, and that they were not bound by the return they made and the provisional valuation which the Commissioners made on the footing of that return. Mr. Cave, K.C., M.P., for the plaintiffs, said a return was made of the property, but not of the minerals, and the valuation on that footing was put at £3,400 as at April, 1909. The property was sold in December, 1910, at £5,500, and if the plaintiffs were denied a separate valuation of the minerals, the difference between those two figures would be treated as wholly increment in the space of a year and eight months, and duty would have to be paid. It was a frightful hardship, said counsel, and his lordship would have to determine whether it was law. The Solicitor-General contended that the return in question was the return contemplated by the section of the Act, and that the capital value of the minerals was finally settled as nil by the operation of the Statute. His lordship said the only question was the construction of the Statute and the effect of what had been done on either side. The actual difficulties and the hardship or otherwise on the plaintiffs were irrelevant. The answer to the plaintiffs' case seemed to him to be that they had been invited to make their return in reference to the land, including the minerals, and they made their return, and there was nothing in the Act to require a separate return as to minerals where, as here, the owners of the land were the proprietors of the minerals. It was said that the proprietor could not make an estimate of the capital value because of the deductions that had to be made, but his lordship saw no difficulty in the proprietors arriving at the sum which they thought should be allowed for deductions, and thus arriving at the capital value. Moreover, it any difficulty existed it was caused by the Act itself and not by the Form. On the whole he thought he ought not to make the declaration asked for, and the plaintiffs' action must be dismissed. The Solicitor-General did not ask for costs.

A new church is to be built at Greencastle, near Kilkool, Co. Down, and extensions to the Parochial House, Kilkool, are also to be carried out. Messrs. E. and J. Byrne, 4, Waring-street, Belfast, are the architects. Applications for quantities should be made to Mr. S. W. Hunter, Scottish Provident buildings, Belfast.

Replying to the toast of the society, the president, at the summer meeting at Leeds last week of the Royal English Arboreal Society, took the opportunity of condemning the high rates charged by railway companies for conveying English timber. "Is it not scandalous," he asked, "that we cannot transport our own timber, produced in this country, at as low a rate as the imported timber? These charges are one of the consequences of our railway companies all being private companies."

At a meeting of the Hull Corporation Works-Committee last week, a letter was read from the city engineer intimating his resignation. In his letter, Mr. A. E. White stated that he had served the corporation for thirty-six years, and during twenty-eight of these years he had been the chief of the department. He felt that the time had arrived when he should seek rest. The chairman moved that the resignation be accepted with regret, and the motion was carried.

The outstanding feature of the last meeting of the Leominster Board of Guardians was the reading of the tenders for the alterations to the casual wards to meet the requirements of the Local Government Board, the plans having been prepared by Messrs. Groom and Bettington, of Hereford. The amounts quoted ranged from £839 to £665, the chairman remarking that he and the vice-chairman had had considerable experience in regard to tenders on the Roads and Bridges Committee, but never had he known such a difference between the highest and lowest tender. Consideration of the tenders, which we give elsewhere, was adjourned for the architect to report on them.

PARLIAMENTARY NOTES.

HOUSING BILL.—This measure was considered in Committee of the House of Commons on Wednesday.—Mr. Macnamara stated that there was a feeling that they might pass Clauses 2, 3, and 4 of the measure, the immediate application of which was to provide for the housing of Government employés at Rosyth, Cromarty, and possibly other places. He hoped that course would be agreed to. In the present circumstances he would be prepared to go on with those clauses, making certain amendments, one of which would take out the provision of such money as was required for Clause 1. He trusted that the Bill would then be passed as a self-contained measure for the purpose of housing these Government employés. In the case of Rosyth the need for such housing would soon become urgent. Amendments consequent on the dropping of Clause 1 were then agreed to, including one limiting the expenditure under the Act to £2,000,000. Some further Government amendments having been agreed to, the Bill was reported to the House and read a third time.

THE MALL IMPROVEMENT. The Committee of the House of Lords presided over by Lord Haversham met on Tuesday to consider the Bill which has already passed the House of Commons to authorise the carrying out of the Mall Approach improvement in Charing Cross, in connection with the Admiralty Arch. Mr. Balfour Browne, K.C., representing the Phoenix Assurance Company, stated that although his clients still held the view that the proposal to take away part of their property and hand it over to the Liverpool, London, and Globe Company, was hardly a just and equitable arrangement, at the present juncture he would not ask the Committee to decide this question as between the two insurance companies. He had the authority of Lord George Hamilton, chairman of the Phoenix Company, to say that, in the circumstances, that company considered it more patriotic not to persist in their opposition. Lord George Hamilton having given formal evidence of the withdrawal of opposition, the Bill was reported for third reading. The latter stage was passed on Wednesday, and the measure now only awaits the Royal Assent.

At Howgrave, Yorks, last Friday, the foundation stone of the new Wesleyan Chapel was laid. The design, which is Gothic, has been prepared by Mr. T. Stokes, architect, of Thirsk, under whose direction and supervision the work will be carried out. There will be accommodation for about 100 people. The total cost will be about £600.

The new church room in connection with St. Andrew's Church, Pilmore, was opened on Tuesday week. It is of bricks, and has a seating capacity of about 100. The work of erecting the structure was undertaken by Messrs. Geo. Richardson and John Scafe, and the rôle of architect was taken by the curate of the parish, the Rev. Herbert Richards.

The foundation stone of a new church at Knebworth was laid last Friday week. Only a section of the building is being proceeded with at the present moment sufficient to accommodate a congregation of 350 people. When completed the church will accommodate 700. The cost of the present section of the church is £4,000. Mr. E. L. Luyens, A.R.A., brother-in-law of Lord Lytton, is the architect, and Mr. W. Darby, of Knebworth, the builder.

At the last meeting of the Staffordshire Education Committee on Saturday, it was reported that the plans of the proposed Staffordshire farm institute were considered by the works sub-committee at its meeting on July 4. The works sub-committee wrote of opinion that the hostel should be erected in proximity to the farm buildings, as shown on the plan. An estimated amount of £23,000, exclusive of the cost of fuel, was agreed upon, and the following apportionment was provisionally accepted: namely farm, £10,600; school, £12,361.

The Belfast Board of Guardians has considered a report, through Messrs. Young and MacKenzie, the Board's architects, from Messrs. John Woolfson and Co., electrical engineers. The report dealt with the offer of the Selas Lighting Co., and gave details of a scheme for heating and lighting the whole of the workhouse premises for a capital sum of £22,308. The present annual cost, details of which were given, is £6,889 3s. 7d., and the maintenance charges under the scheme would amount to £4,552 annually, exclusive of the sum required for the repayment of the loan for the work. The matter was referred to the works committee for consideration.

Our Office Table.

The Crystal Palace became the property of the nation yesterday, when the transfer was completed between the present trustees and the trustees representing the British people. The first meeting of the new trustees took place immediately after the transfer. Fifteen thousand pounds is the annual revenue that Sir David Burnett requires to pay expenses. The removal of the structure, which will be immediately taken in hand, is expected to occupy eight years and entail an annual expenditure of £5,000, in addition to the sum required for administration. Every endeavour is to be made to regain for the palace the popularity that it once enjoyed. On the educational side an effort will be made to widen the scope of the Crystal Palace School of Art, Science, and Literature, and to secure that prominence for the Crystal Palace School of Engineering that the institution so rightly deserves. It is not generally realised that the several levels in the giant south tower are occupied by the workshops and drawing offices of one of the most practical schools of its kind in the kingdom.

Tattershall Castle, Lincolnshire, will be opened to-morrow, August 8. It will be remembered that in the autumn of 1911 Lord Curzon purchased the castle, and subsequently the sculptured stone fireplaces, which were on the brink of removal from the country, with the intention of restoring and ultimately presenting them to the nation. During the last two and a half years the work of restoration has proceeded, and is now complete, the two moats which had been filled in having been excavated, and the fabric of the castle, which was in partial ruin, restored to its original condition. It now forms a unique example of domestic and military architecture of the Early 15th Century. The official opening will be attended by representatives of the leading archaeological and antiquarian societies, and the party will be conducted round by Mr. W. Weir, the architect, who has been in charge of the works.

The forthcoming exhibition and convention of the National Association of Master House-painters and Decorators of England and Wales (Incorporated), to be held in Manchester in September next, promises to be of exceptional importance. The association has secured the City Exhibition Hall, Liverpool-road, for the purposes of an exhibition of decorative art and manufactures. An important and interesting feature this year will be the special exhibition of painters' class work, to which the large gallery of the hall will be exclusively devoted. Exhibits of the work done in these classes have been sent from all parts of the Continent, including France, Germany, Holland, and Belgium, and from the chief centres of Great Britain. Lord Emmott, his Majesty's Under Secretary of State for the Colonies, has consented to open the Exhibition on September 18, and the Lord Mayor of Manchester has promised to preside on the occasion. The Exhibition remains open the whole of the following week, and closes on Saturday evening, September 26. The funds derived from the Exhibition are devoted to educational work amongst the young men engaged in the painting and decorating trade, and the association during its twenty years' existence has spent upwards of £3,000 in furthering this work. Many students have been sent to Italy to study the decorative work of the masters, and many men occupying honourable positions in the trade to-day owe their first start to the stimulus of the association.

Volume VIII of the Transactions of the Edinburgh Architectural Association appears this week as an attractive illustrated and uniform with its predecessors of former years. It contains reports of lectures and papers by Messrs. Hippolyte F. Lecoq, Dr. U. Hay Fleming, Rev. Dr. H. G. G. J. A. Morris, A. N. Paterson, Alexander Portledge, and J. H. Stevenson, and among the sketches and photographs reproduced may be noticed those of the Gatehouse at Lindisgow Palace.

the churches of Craig and Pitsligo and Craigievar, Drum and Muchalls castles.

The appointment of Mr. William Brodie to the important position of principal assistant to the dock engineer under the Mersey Docks and Harbour Board is one which has elicited the heartiest congratulations from engineering circles in Liverpool. Mr. Brodie, who is a member of the Institution of Civil Engineers, and an ex-president of the Liverpool Engineering Society, is brother to Mr. J. A. Brodie, the Liverpool city engineer, and has qualifications which well fit him for the part he is now called upon to fulfil.

Another controversy respecting a Lake District bridge has arisen in the proposal of the Cumberland County Council Highway Committee to substitute the present Greta Bridge, Keswick, with a ferro-concrete structure. At an influential meeting, held at Keswick, presided over by Canon Rawnsley, a resolution of protest was carried unanimously. A second resolution that a petition should go to the urban council asking them to support the opposition to the proposed ferro-concrete bridge and the widening of the present bridge on existing lines, which they advocated from the first, was carried.

An interesting police-court prosecution is, says the *Liverpool Post*, pending under very peculiar circumstances. The Works Committee of the corporation of Wallasey resolved, by two votes to one, six other members present not voting, that proceedings should be taken against a certain contractor for an alleged offence which need not be specified here. In consequence of this remarkable abstention from voting, a meeting of the council in committee was called for Wednesday evening last in order that the recorded decision of the committee might be reviewed. After a prolonged debate, it was then decided, by sixteen votes to six, several members still not voting, to reverse the committee's decision and not to take proceedings. At the council meeting on Thursday in last week a suspension of standing orders was necessary for the consideration of these particular minutes. But when the time came the requisite twenty-five members were not present, and the suspension of standing orders could not be carried, with the result that the original resolution and the instructions to prosecute stand good, notwithstanding the subsequent resolution to the contrary.

While the Committee of the House of Commons was considering the Manchester Corporation proposal to spend £300,000 on the extension of water mains, workmen excavating in Withygrove were digging out some relics of a very early means of water supply in the city. These were water-pipes apparently of sandstone, which, as a workman said, "was laid a bit before you was born." Cut out of solid sandstone, the pipes have an outward diameter of about twenty inches, and are hexagonal in shape. The bore is some six inches in diameter, and the union of the lengths of pipe is made by means of a collar, also of sandstone, which fits over the point of junction and is welded to it—if one may use the word by a natural cement, which in the passing of the years has set like adamant, often defying even the sledge-hammers which have broken the pipes into pieces, leaving the joints intact.

A meeting of the Newcastle and Gateshead Trades and Labour Council was held in the Collingwood Hall, Clayton street, Newcastle, last week, when the question of supporting the Trades Hall Social Club and Institute, Ltd., in Percy street, Newcastle, was again before the council, the executive committee of which, in a report, recommended an investment of £5 in the club, with direct representation on its council, and a friendly working arrangement between the club and the Trades Council. The secretary (Mr. J. Wilkinson) said they had been talking for many years of establishing a trades hall, and through the enterprise of two or three of the lower paid unions they were able to have one, and it only needed the council's help and blessing. The sum of £5 might look a little paltry; but the executive believed in going

cautiously, and if the club came up to expectations, the council, he said, would be willing to help it still further. All the large towns in the country had trades halls, except one, and that, the city, which was practically the home of trade unionism. The proposition was carried without discussion.

The Bristol city engineer's report contains a table showing the number of houses erected during the past sixteen years. In 1899 the total was 1,157, and for each of the succeeding three years the number exceeded 1,500. In 1903 there was a drop to 1,240, and in 1904 to 1,176. Then there was another advance to 1,206 in 1905, and 1,372 in 1906. From that period there has been a gradual diminution. There were 1,239 houses erected in 1907, 859 in 1908, 454 in 1909, 386 in 1910, and the numbers for the last four years have been 297, 204, 218, and 132 respectively. The same table gives the number of inhabited houses, number of persons per house, number of void houses, and the estimated population for the past six years, and the results work out as follow:—

Year.	Population estimated.	Inhabited houses.	Persons per house.	Void houses.
1909	377,642	67,200	5.61	4,800
1910	382,550	67,650	5.65	4,750
1911	357,059	67,950	5.2	4,650
1912	359,400	68,080	5.28	4,500
1913	361,362	69,175	5.22	3,400
1914	363,312	69,985	5.19	2,600

The number of houses closed last year was 157, and of these thirty-seven were voluntarily demolished.

An exhibition of gyroscopic mechanism is being organised at the Science Museum, South Kensington, and at a private view given last week, Mr. J. W. Gordon explained his models, one of which is designed to show how a high flywheel speed may be obtained with a low shaft speed, without the use of gear-trains. The principle involved was described in Mr. Gordon's paper on "An Engineering Theory of the Gyrostat," read in Birmingham last year before the British Association. This is, that, in constrained precession the movements of forced and free precession are opposed—the one tending to set the axis of spin at right-angles to the field plane, and the other tending to place it in the field plane. Thus the forced precession can be employed to feed the free precession by restoring the potential which the gyrostat lost in free precession. Another model was exhibited to show how the restriction of angle of the gyrostat might be got rid of.

Many may have noticed, remarks the *American Architect*, that the wood of the same species frequently behaves quite differently, even under similar conditions. This can be attributed to the character of the wood itself as a result of the particular soil and climatic conditions under which the trees grew. The wood of a mahogany tree grown on high and well-drained situations is usually much harder and more durable than that which is produced in low, moist soil. This difference in the manner of behaviour can be readily understood in the case of the white oak. The wood of slowly grown oak is often exceedingly brash, because it contains a very large proportion of early, porous wood. That of a fast-growing oak has a small proportion of early porous wood, and is much denser and heavier.

When two pieces of wood cut from the same tree show a marked difference in their behaviour under exactly similar external conditions, another influence must be at work, which has often puzzled the layman. The position of a stick of wood has a great deal to do with its durability and general behaviour. For example, a fence post will be found to decay much faster if the top end is placed in the ground than if the butt is placed down. The reason for this is that the moisture of the atmosphere will permeate the fibres of the wood much more rapidly in the way the tree grew than it will in the opposite direction. Microscopical examination of the wood shows that the fibres invite the ascent of moisture, while they repel its descent. A good many have observed in a wooden bucket that some of the staves appear

to be entirely saturated with water, while others are apparently quite dry. This is due to the fact that the staves which are dry are in the position in which the tree grew, while the saturated ones are reversed.

The famous time-ball at Greenwich is to be replaced by a new aluminium ball, its mechanism overhauled and reconstructed. The winch will be removed from its present position near the Octagon Room to the Ball Lobby. The time-ball was first erected in 1833. An electric current from the clock was first used to drop it at one o'clock in 1852. In 1855 the ball was blown down into the courtyard. Some repairs were made in 1895, when the chain broke during winding, and again, in August, 1913, some temporary repairs were made to the ball.

A French engineer, M. Mähl, has recently submitted to the Minister for Public Works in France a scheme for a suspended mono railway on which, it is claimed, speeds of 150 miles an hour or so may be attained with safety. The track, either single or double, is to be carried 20ft. to 25ft. above the ground by catenary suspension. The train will be composed of small sections freely articulated, and will easily take curves of 1 kilometre radius and gradients of 1 in 20. It will be propelled, of course, by electricity. Each section of the train will be suspended from two wheels placed about 1 metre apart. The seats will be placed longitudinally, and there will be but a single row of them.

MEETINGS FOR THE ENSUING WEEK.

THURSDAY.—Institution of Municipal Engineers. Visit to the South Metropolitan Gas Company's Works at East Greenwich. 2 p.m.

SATURDAY (AUG. 15) TO MONDAY (AUG. 17).—Institution of Municipal Engineers. Week-end Visit of the Eastern and North-Eastern Districts to Hunstanton.

Trade News.

WAGES MOVEMENTS.

DUNFERMLINE.—After being on strike for seven weeks, the operative plumbers of Dunfermline accepted on Friday the offer of the masters, and resumed work on Monday morning. The original demand by the men was for an increase of from 8d. to 9d. per hour. After some negotiations the employers offered 8½d., with an additional ½d. four months after the resumption of work. This offer was made about a month ago, and has now been accepted by the men.

EXETER.—The bricklayers and plasterers at Exeter have resumed work. The master builders have granted an increase of halfpenny an hour on August 1, and a provisional further halfpenny on February 1, the latter advance to be made the subject of an appeal by the Master Builders' Association to the Conciliation Board.

A new Wesleyan chapel is being built at Bishop Sutton. The contract has been taken at a little over £700 by Messrs. Flowers, of West Hartpree.

The trustees of the Whitechapel Art Gallery have appointed Mr. H. Samuel Teed to the post of art director, in succession to Mr. Gilbert A. Ramsay, who has accepted the office of superintendent of the Glasgow Municipal Art Galleries and Museums.

Bristol Docks (Various Powers) Act, which has just received the Royal assent, empowers the city council to raise £100,000 for new cold storage. The warehouse will be on the pattern of the tobacco warehouse, and will be erected on a site behind the "O" shed.

The will of the late Mr. Henry Thomas Holloway, who died on May 8 last, aged 61, of The Manor, West Lavington, Wiltshire, and of 19, Cedars-road, Clapham-common, S.W., director of Messrs. Holloway Brothers (London) Ltd., J.P. for Wiltshire, has been proved at Exeter by Messrs. Belvedere-road, S.E., and J.P. for Wiltshire, has been proved at a gross sum of £281,699.

The new drill-hall, erected by the Staffordshire Territorial Force Association in Nineveh-road, Handsworth, was opened on Saturday week. The building contains a drill-hall, officers' room, orderly-room, etc., is of brick, the front elevating to Nineveh-road being faced with variegated coloured bricks with stone dressings.

TRADE NOTES.

Boyle's latest patent "Air-Pump" Ventilator has been applied to the Parochial Hall, Teignmouth.

Claridge's asphalt is being used on the roofs of the new County Hall, Northallerton, and Sledmere Hall, near Malton.

The National Radiator Company, Ltd., 439 and 441, Oxford-street, London, W., has issued three leaflets giving particulars of the Ideal No. 1 and 2 "G" Series Boilers, a new type of boiler which they are just placing on the market. In these boilers the construction obviates the necessity for a loose base, thus entirely overcoming the difficulty often experienced in forming an airtight joint between sections and base. These boilers also occupy much less space than other sectional boilers of equal capacity, and provide flow-tappings at a very low height above the floor-level. This is a particularly valuable feature in the ease of the No. 2 "G" Series Steam Boilers, which, with capacities running up to 488,000 B.T.U., or 1,890sq.ft. of direct radiation, have a flow outlet only 38in. above the floor line. The No. 1 "G" Series Boilers are sent out assembled, while the No. 2 "G" Series, to facilitate handling and erection, have the sections cast in halves. We also call special attention to the patent insulating jackets, which are supplied for these boilers. These jackets consist of steel and non-conducting material, and are complete in themselves. As they are not fastened to the boiler, bolts and screws are dispensed with, and, owing to the fact that they consist of only five parts beside the key-strips and corner-pieces, they can be fixed in a few minutes. Specimens of both the No. 1 and 2 "G" Series Boilers are on view in the company's showrooms. Another leaflet gives particulars of several new specialities. Copies of these insets are being sent to the principal trade and architects this week, but the company will be pleased to forward same to any firms who may not have received a copy.

Mr. A. B. Blaschek has been appointed deputy surveyor to the Forest of Dean, and director of the proposed forestry demonstration area, as successor to Mr. Leese.

A new stained-glass window has been dedicated at the parish church of Brompton, near Chatham. The window, which represents St. Simeon and St. Anna, occupies the east end of the south aisle of the church.

Mr. James Wharton, master builder, of Keighley, died at his residence, Grafton House, in that town on Saturday, aged 52, after a long illness. He was mayor of the borough in 1908-9, and had begun work at the age of eight.

The operations of H.M. Office of Works in connection with the exploration of the site of Penrith Castle have been begun. The buildings put up nearly sixty years ago by the London and North Western Railway Company are being pulled down, and the work already done has made a great difference to the appearance of the place.

Plans have been prepared by Mr. Leonard Durrell, of Calgary, for the new departmental building to be erected at Calgary for the Dominion Government. The building is to be partly constructed with material taken from the old post office lately demolished, and will occupy a site at the corner of 6th-avenue and 4th-street west.

A new parish hall which has been built in connection with Christ Church, Jarrow, was opened last week. The hall has been erected on a site adjacent to the church and has cost about £1,500. It was built by Messrs. Middlemiss Brothers, Newcastle, from the designs of Messrs. Hicks and Charlewood, Newcastle-on-Tyne.

Meetings of the Northants and East Midlands Surveyors' Associations took place at Northampton on Thursday week. With Mr. A. Fidler, the president, in the chair, a meeting was held at the town hall, when rules were adopted, and an exhibition of town-planning designs prepared by Mr. Fidler was on view. The members subsequently inspected various local works.

The Douglas Town Council have purchased the Pulrose estate, near Douglas, consisting of over 200 acres of arable land, two farm houses, a mansion, a laundry, and a corn mill, for £19,000. It is the intention to use the property partly for the disposal of such refuse as is not already dealt with by the existing sewerage system, and in all probability a destructor will be erected. At present the refuse is taken out to sea in hopper barges and discharged, but this system has been very costly.

LATEST PRICES.

IRON.

Table of iron prices including Steel Joists, Wrought-Iron Girder Plates, Steel Girder Plates, Bar Iron, and Boiler Plates.

Table of Galvanised Corrugated Sheet Iron and Wire Nails (Points de Paris).

Table of Cast-Iron Columns, Cast-Iron Stanchions, Rolled-Iron Fencing Wire, and Galvanised Wire Strand.

Table of Cast-Iron Socket Pipes in various diameters.

Table of B.B. Drawn Telegraph Wire and other wire products.

OTHER METALS.

Table of prices for various metals including Spelter, Lead, Copper, and Tin.

TIMBER.

CONSTRUCTIONAL.

Table of timber prices including Yellow Pine Deals, Spruce Deals, Red Deals, and various types of flooring.

FURNITURE AND HARDWOODS.

Table of furniture and hardwood prices including Teak, Oak Planks, and various types of wood.

STONE.

Table of stone prices including Red Mansfield, Darley Dale, and other stone types.

Table of Portland Stone prices and delivery information.

CHIPS.

Mr. G. L. Pegler, surveyor, planned the first group of sixteen houses which have just been completed on the garden tenants' estate suburb at Shirley, Southampton.

A movement is on foot at Brighton to create a municipal estate department, which shall have control of the whole of the properties belonging to the corporation.

The new cathedral at Chicoutimi, Quebec Province, the estimated cost of which is placed at 300,000 dollars, is nearing completion, the roofing work now being in progress.

The work on the Meade Memorial Chapter House at St. Fin Barre's Cathedral, Cork, is now well advanced. It is being carried out according to the general plans made by William Burges, who designed the cathedral.

Canon H. Darwin Burton laid the foundation-stone last Saturday week of the new parish hall in course of erection for St. Saviour's Church at Culver-road, St. Albans. The architects of the building are Messrs. Mence and Finn, and the builders Messrs. Miskin and Sons.

The Greater Winnipeg Water District Administrative Board will receive on Saturday, September 19, separate tenders for the construction of an aqueduct and intake from Indian Bay to Deacon. The whole undertaking involves the expenditure of about 8,729,000 dol.

A new juniors' school, erected by the Rochdale Education Committee in Canal-street, Castleton, was opened on Saturday. It accommodates 300 children in six classrooms, and is provided with an assembly-hall 56ft. by 25ft. The classroom floors are of concrete, to the face of which is cemented a thick covering of linoleum.

Telephone DAIKTON 158.

OGILVIE & CO. Many years connected with the late firm of W. H. LASELLES & CO., of Bunhill Row. MILDMAY AVENUE, ISLINGTON, N. EXPERTS IN HIGH-CLASS JOINERY. ALTERATIONS & DECORATIONS. ESTIMATES FREE.

FOR Olivers' Seasoned Hardwoods, WM. OLIVER & SONS, Ltd., 120, Bunhill Row, London, E.C.

TENDERS.

* * * Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender; it adds to the value of the information.

BATH.—For the erection of Drill Hall and offices, for the Somerset Territorial Force Association. Mr. A. J. Pictor, A.R.I.B.A., Bruton, architect:— Wilkins, R., Bristol ... 48,754 0 0 Stockham, T., Bridgewater ... 6,663 0 0 Poles, H., and Son, Bristol ... 6,223 0 0 Cotard H., and Sons ... 6,200 0 0 Wills and Son ... 6,108 0 0 Blackmore, R. ... 6,006 8 0 Hayward and Wooster ... 5,983 0 0 Long, J., and Sons ... 5,940 0 0 Chancellor, E., and Sons* ... 5,935 0 0 * Accepted. Rest of Bath.

BELLEEK, CO. FERMANAGH.—For fourteen cottages, for the rural council:— Campbell, J., Cormore, Belleek (accepted), at £138 per cottage.

BRIXWORTH.—For painting the interior of the workhouse:— Buswell, R. ... £50 12 6 Crane, F. W. ... 39 0 0 Letherland (accepted) ... 47 18 0

CHISWICK, W.—For the erection of a new secondary school in Burlington-lane, Chiswick, for the education committee of the County Council of Middlesex. Mr. H. G. Crothall, F.R.I.B.A., architect:— Neal, G. ... 413,096 0 0 Brand, Pettit and Co. ... 13,067 0 0 Fairhead, A., and Son ... 13,780 0 0 Monk, A. ... 13,739 0 0 Knight, H., and Son ... 13,656 0 0 Leeder, L., and Co. ... 13,620 0 0 Lawrence, W., and Son ... 13,582 0 0 Fassnidge and Soc ... 13,500 0 0 Gibson, W., and Co. ... 13,370 0 0 Mattock Bros. ... 13,294 0 0 Hanson, A. and B. ... 13,244 1 2 Dickens, W. J. ... 13,191 0 0 Lacey, W., Hounslow* ... 12,971 0 0 * Recommended for acceptance.

CLAPHAM, S.W.—For the incorporation of additional land at the Sleaford-street school, Clapham, for the London County Council:— Hooper, T., and Son, Lambeth ... £575 0 0 Lole and Co., Chelsea ... 493 0 0 Polden, A. and F., Shepherd's Bush ... 410 0 0 Bowyer, J. and C., Ltd., Upper Norwood ... 389 0 0 Fletcher, F. W., Tooting ... 385 0 0 Triggs and Co., Clapham ... 368 0 0 Carrett, J., & Son, Balham Hill* ... 311 0 0 * Architect's estimate, £480. * Recommended for acceptance.

COXHOL, CO. DURHAM.—For the erection of concert hall (contract No. 1), for Literary Institute Committee. Mr. W. A. Kellert, 2, South-road, Bishop Auckland, architect:— Bell and Rowe, Coxhoe (accepted) £1,107 16 5

DONCASTER.—For the erection of Morley U.M.I. church and schools. Messrs. G. Baines and Son, 5, Clements-inn, Strand, W.C., architects:— Dorey, J., and Co. ... £5,866 0 0 Longden and Son ... 5,730 0 0 Sheldon, D. ... 5,710 0 0 Eschley and Son ... 5,690 0 0 Fidler, J., Ltd. ... 5,636 0 0 Arnold and Son ... 5,386 0 0 Beeton, W. M. ... 5,193 17 3 Rhodes, P. ... 4,979 0 0 Sprakes and Son ... 4,962 0 0 Gill and Son ... 4,957 0 0 Perks and Son ... 4,802 2 0 Pattinson, W., and Son* ... 4,767 0 0 * Accepted with modifications. Contract, £4,526 16s. 6d.

DUBLIN.—For the extension of the Dental Hospital, Lincoln-place. Messrs. Orpen and Dickinson, architects, and Messrs. Beckett and McCreaf, quantity surveyors:— Thompson, J. and R. ... £3,510 0 0 Mellor, R. E., and Son ... 3,285 0 0 Beckett, W., and Son ... 3,147 0 0 Crampton, G. and T. ... 3,110 0 0 Frazer, A., and Co. ... 3,096 0 0 Collen Bros. ... 3,000 0 0 Good, J. and P. ... 3,080 0 0 Bolton, S. H., and Sons ... 2,991 0 0 Pemberton, J., and Son ... 2,880 10 0 Martin, H. and J. (accepted) ... 2,787 0 0

FINSBURY.—For the erection of temporary offices at the New River Head, Rosebery-avenue, for the Metropolitan Water Board:— Wall, C., Ltd., Chelsea ... £1,650 0 0 Coarney, W. J., Gate P. Smith, and Co., Stratford ... 1,466 0 0 McManus, J., Hammersmith ... 1,367 0 0 Rea-Son, W., Rosebery-avenue ... 1,349 0 0 Harrow, W., South Bernershey ... 1,344 0 0 Humphreys, Ltd., Knightsbridge ... 1,320 0 0 King, W., and Sons, Vauxhall Bridge-road ... 1,300 0 0 Wylie and Lockhead, Ltd., Bloomsbury ... 1,300 0 0 Humphreys, Ltd., Knightsbridge ... 1,261 0 0 Pattinson, W., and Sons, Ltd., Westminster ... 1,150 0 0 Harrison, J. and Co., Camberwell (accepted) ... 1,100 0 0

GLASGOW.—For constructing approach to Kelvin Art Galleries, excavation work, &c., for the corporation. Mr. J. Lindsay, town clerk, City Chambers, Glasgow, architect:— Wilson, W., 34, West George-st., Glasgow (accepted) ... £1,825 8 1

AMERICAN ADVERTISERS AND AMERICAN BUILDING CONSTRUCTION.

The immense area over which specialised building appliances are distributed, by advertisement, throughout a great continent like America affords, of course, direct facilities, which, it is true, are obtained indirectly over even a much greater area by our own colonies and our protectorates, but which the British advertiser does not avail himself of to anything like the extent of his American compeer's enterprise. The sun never sets on the well-placed advertisement in the BUILDING NEWS, for instance, and its matter pages and illustrations bear almost weekly witness that it is as well known in Australia, Canada, and India, as in London. The harvest is there; but if the home manufacturer does not make his existence known, he may just as well shut himself up in his own street at home. The American knows that, and is always a bold advertiser. He does not limit himself to paragraphs, or even columns, in his favourite media; he revels in whole pages, and he has his reward. American advertisements, again, are never commonplace. They always command attention. One firm informs us that "Our heads of departments are experienced men who gained experience in doing fine work; our men are the boys that came into this plant and learned their trade right here." Another says: "We understand handling glue." Little glue, we guess, sticks long to the fingers that penned that slightly ambiguous but terse manifesto. The American advertiser is always alive: handling, holding, or carrying something which he is anxious to turn over to someone else for a consideration. Our advertisers here at home are beginning to handle and hold things, too, and need infringe no Yankee patent expressions. We do not by any means recommend the use of such assurances as: "Every piece of wood we send out has been subjected to our own scrutiny and superintendence"; "We are not the cheapest people on the market and do not seek that trade"; "We manufacture from the stump to the finished product, and know how to do it"; "Indiana oak is the standard by which all oak is judged. In Indiana we have our own forests." No one will be surprised to hear that this enterprising firm does not use ordinary kilns for drying wood; they have "retorts." After that one is rather disappointed that there is no mention of a volcano or two in Indiana, where they dry their marvellous lumber; but anyhow, from that stock they can carry out, in natural woods, any scheme of decoration except light blue. In these advertisements there is much space

occupied, and it is costly; but attention is arrested, every word tells, and there is not the slightest chance of the reader falling asleep over them. It is doubtless true, as we were all taught in our youth, that truth is stranger than fiction, yet in advertising it is well to remember that truth may reasonably claim such moderate exercise as not to exceed what may be poetic license, and that fancy may play attractively even round an advertisement of such prosaic stuff as building material. One blunder the American advertiser never makes. You cannot persuade him that an advertisement once a year is quite as good and much cheaper than one once a week; or that, in dull times, or in the days of distraction or disturbance, the first thing to do is to stop advertising. He knows better than to risk such an inquiry as at this moment we stopped writing to reply to on the phone—whether an advertiser whose usual list an architect had looked for in vain "had gone out of trade."

Among the most resourceful American advertisers are the reinforced concrete men. They quarry oolitic limestone, and can crush 2,000 yards daily; their quarries yield dimension stone of the very best kind in the United States; it is sawn to sizes for building and cemetery use. The rock formation is described as being massive, with very few seams, and of great thickness and extent. It is quarried by the use of steam-channelling machinery and drills, and blocks up to 25 tons are easily obtained. This firm announce that they will not undertake cut-stone work; they furnish rough and sawn dimension blocks only. A fireproof building company are modestly contented to announce that they have done 300,000,000 dollars' worth of such work, and they give illustrations of buildings in such number, so many stories high, and covering so much ground on plan, that one wonders, like Martin Chuzzlewit, junior, whether there is anything else left to build. A constructive company "handles" most efficiently the many problems in connection with building construction, and builds everywhere—in the States, Mexico, and Canada. A contractor for inburnable construction announces that distant work is one of his easiest problems, and he combines fine and exact work with very unusual speed. A general contractor "handles" contracts of any size, and draws special attention to the "number of times he has received a second contract from the same owner or architect." The Unit Construction Company adopts a "moulded in advance" method of concrete building, and claim that it affords the greatest opportunity for inspection during construction, and of testing of concrete units before

using. Accuracy and maximum strength are assured, all joints being determined by designing engineers. As all forms are on the ground, the concrete may be given any finish desired. A building can be put up rapidly in this way by employing several "forms," and as soon as one story is erected it can be used, as there is no waiting for the removal of centering. All their work is done with their own "forces," as they do not license others to use their patented methods. A building company advertise the various kinds of buildings they put up. Here they are: Office buildings, factories, schools, churches, residences, power-houses, country houses, monumental work, armouries, bank buildings, reinforced concrete "from our own design," engineering construction of all kinds, and landscape work. They boast that their knowledge of costs, gained from long experience, enables them to advance accurate preliminary information to architects upon request. They also build "everywhere" in the United States or abroad, their construction being always characterised by the same successful and rapid results. One of the firms which build factory chimneys uses hollow radial bricks, which it manufactures itself. These are bonded in a peculiar way, owing to the use of bricks varying in length from 4in. to 10in. These bricks are made to the curve of the chimney, so that they maintain correct circular and radial lines. The bricks are perforated, and the mortar in these perforations forms continuous bolts running through the shell of the stack. This they call a vertical anchorage. Steel bands are inserted in the brickwork to take the stress due to expansion caused by heat. Their chimneys are built from the inside, thus doing away with expensive and dangerous outside scaffolding. This firm claims that it has erected the most slender building in the world; it has a diameter of only 5ft. at the top, and it is 160ft. high. As it may be of interest to some of our readers, we give this firm's specification for a chimney: "The foundation is built octagonal, of Portland cement concrete 1-3-5 properly rammed. Where there is an underground flue, ample protection is given the concrete against direct contact with the ground. The base is built octagonal or square, 2m. diam., about one-fifth of the height of the chimney, if an overhead flue is required. Base, as a rule, built in hard common bricks, laid in cement-lime mortar in a full mortar bed, joints about three-eighths of an inch thick, every fourth course to be a header course, and the whole exterior properly pointed. A cast-iron clean-out door and frame, 24in. by 36in., will be furnished and built in at the base. The round shaft is built of hard-

burned weather and acid-proof Perforated Radial Bricks, laid in cement-lime mortar, in the 'Henicke bond,' and with full mortar bed joints about $\frac{1}{2}$ in., and properly pointed. Shaft provided with an ornamental head and with concealed reinforced bands, and having inside step-irons ($\frac{3}{4}$ in.) 16 in. apart, forming a ladder the entire height of the chimney. The lining of Radial Fire Bricks extends at least to the top of the base. The lightning-rod consists of a securely-mounted lightning arrester, with one point to each foot of clear diameter at top, and a $\frac{1}{2}$ in. cable conductor with fastenings, together with suitable earth connections." Another firm say that they are designers and builders of masonry chimneys built of corrugated perforated radial brick, reinforced concrete, and common brick. The radial bricks of this firm are corrugated at the ends: this gives a mortar adhesion 62½ per cent. greater than between ordinary flat-sided bricks. In these radial bricks horizontal bond is obtained in width as well as in length, for, unlike our bricks, which are always 4½ in. wide, they are of various widths from 3 in. up to 12 in., vertical bond being obtained by a number of twisted high-carbon steel bars built into the concrete chimney. Triangular wire mesh is used for horizontal or circumferential reinforcement. The following is a list of some of the chimneys built with radial brick, 300 ft. by 22 ft., 250 ft. by 12 ft., and 225 by 11 ft. 6 in. In concrete, 250 ft. by 13 ft., 225 ft. by 11 ft., 200 ft. by 12 ft., 175 ft. by 10 ft., 150 ft. by 5 ft., and 125 ft. by 4 ft. 6 in. With reference to building with radial bricks, there is this difficulty. As the chimneys are never cylindrical, but always taper, the bricks that will fit one ring accurately will not fit the next, so that to build with mathematical accuracy each course should have a specially made series of bricks. Neither of the radial-brick builders alludes to this difficulty.

An advertisement, with a good illustration of thirteenth-century groining covering a fifteenth-century nave, introduces the architect to what the inventor calls "timbré vault construction." This company makes a speciality of dome construction—that of the cathedral of St. John the Divine, New York, being the largest dome they have built. It spans 135 ft. at the base. The domes and vaults are built with "timbré tiles," which are made in a factory owned and operated by the company. Vaulted ceilings, roofs, and floor-construction form a large portion of the business of this firm, and they claim that the class of work it is particularly adapted for are buildings of the monumental type, such as state-houses, court-houses, libraries, churches, etc., in which a vaulted ceiling is notably acceptable when finished in tiles, glazed or unglazed. To take tension stresses, a small amount of steel is embedded in the masonry. Here we may note in passing that brickwork, or baked clay in any shape, built into the work is referred to as "masonry." Next we have a house-raising, moving, and shoring company, which is content with a wealth of illustration, and shows a building 110 ft. long and 65 ft. wide, weighing about 2,500 tons, which was moved a distance of 500 ft. and half-turned. A firm bearing the novel name of "The Foundation Company" make a speciality of foundations of great depth, in treacherous ground, and to carry heavy weights. They claim to be specialists in this work, and they suggest or advise the foundation construction best adapted to the conditions presented. Pneumatic caissons, open caissons, sheet piling (wood or steel), concrete piles, hollow steel pipe filled with concrete, and wooden piles are appliances all coming within range of their work. An exhaustive list of their works is given, and no expense is spared in advertising every advantage they are possessed of. Another

foundation firm is "The Raymond Concrete Pile Company," which has driven over four million feet of Raymond concrete piles. The Raymond piles are made by driving a tapering sheet-steel shell "to refusal" by means of a collapsible steel mandrel, withdrawing the mandrel, and then filling the shell with concrete. The shell remains in the ground. It is usually of plain sheet steel; but where back pressure is unusually severe, specially reinforced shells are used. In all other concrete piles the shell is withdrawn—that is, of course, when the concrete is made-in-place. The essential features of these piles are (1) Driving the mandrel to a resistance sufficient to carry the desired load; (2) The maintenance of the hole, and the sustaining of the initial pressure between the pile and the surrounding soil by the shell that remains in the front; (3) The protection of the pile during the time that the concrete is setting from distortion due to the driving of the adjacent pile, and from the admixture of water, silt, quicksand, or other soil, by means of a shell that remains in the ground. Perhaps, after all, the advertiser likely to attract all trouble-savers is one who "recognises the fact that every situation requires individual study in order to determine first what is best suited to meet the local conditions. We give each job special consideration, and then design and build whatever best meets the need."

BUILDING REGULATIONS FOR SECONDARY SCHOOLS.

Following closely upon the heels of the revised regulations relating to the planning and fitting up of elementary schools, issued three weeks ago by the Board of Education, and reviewed by us in our issue of the 24th ult., p. 103, a second White Paper is now published, price 2½ d., dealing in like manner with the building regulations for secondary schools. In a prefatory note Sir L. A. Selby-Bigge, the Permanent Secretary to the Board of Education, remarks that the combination of efficiency and economy is the perpetual problem of the school architect. The regulations, replacing those published in 1907, are the outcome of discussions which have taken place during the last six years in numerous particular cases between the Board's officers and the officers and architects of local education authorities and governing bodies; they have also been submitted in draft to certain bodies and individuals whose experience specially qualified them to advise the Board in the matter. While the Board take entire responsibility for the present form of the regulations, they hope that they represent a very general consensus of opinion both of professional architects and of other persons engaged in educational administration. The principal modifications in the present issue relate to the position of the assembly-hall in relation to the classrooms, the need of making provision for physical training in every new school, the arrangement of cloakrooms, and certain details in connection with art and science rooms, housecraft rooms, and staircases.

In this new edition the arrangement of the Regulations has been revised. The division into two parts, one dealing with principles and one with hygienic and sanitary requirements, has proved to be inconvenient. All the regulations that refer to one subject are now grouped under the same heading. In the order adopted sites and general considerations are first dealt with; next, a list is given of all the rooms which may be found in a secondary school; then detailed provisions are set out with regard to each of these rooms. The following chapters deal with the boarding-houses, ventilation and heating, construction and materials, and water supply. At the end the procedure for obtaining approval of plans is set out. A note on the requirements of the Local Government Board relating to loans in respect of schools other than public elementary schools is printed as an appendix.

The Board offer to place their experience at the disposal of the promoters of a new school, or to discuss a building scheme either before the preparation of plans, or while the drawings are in a preliminary stage. They will be ready to give careful and, so far as possible, favourable, consideration to individual designs or experimental modes of treatment which promoters of schools and their architects may propose to adopt to meet the special exigencies of particular cases.

The following are some of the principal regulations:—

SITES, PLAYGROUNDS, AND PLAYING-FIELDS.

The site for a new school should, if possible, not be exposed to noise or dust from roads, streets, tramlines, railways, or works. It should be such that the building can either be set well back or have its classrooms on a side away from the street or road. There should be convenient access to the site. The site should be open to the sun, both for the sake of the general health of the pupils and staff, and because the ventilation of the building is then easier. The site should secure the best aspect possible for the classrooms, which is south-east. In the warmer parts of England, east may be a better aspect than south. Windows which look to quarters other than these should, so far as possible, be those of corridors, staircases, cloakrooms, assembly-halls, cookery rooms, art rooms, and the like. The most should be made of any natural advantages which the site may possess. Pleasant views should be left open instead of being shut off by high boundary walls. Dull walls may be covered with creepers and bordered with flower-beds. If it is consistent with the proper lighting of the school, trees should be preserved or planted, to give shade in summer to open-air classes. When the extent of the site is being considered, the provision of suitable plots for botany, gardening, and other natural-history work, should be borne in mind. In every school there must be a playground suitable to the size of the school, which should provide a clear space of 50 square feet per head; but in no case must the playground contain less than 750 square yards. Special consideration will be given to the case of schools in large towns. There should be separate playgrounds for the two sexes. (a) The playground should be given a warm, sunny aspect and provided with seats. (b) The buildings should be so planned that the effective playground space will not be unduly diminished by projecting wings or buttresses. Bicycle sheds should be provided. Playing-fields must in all cases be provided. Wherever possible the playing-field should be adjacent to the school, and every effort should be made to secure a site which will admit of this arrangement. The minimum effective area for a playing-field may be taken as two acres. This will usually suffice for a school of 100 pupils, but the area will require to be increased in proportion to the number of pupils and the provision of games. Boys, as a rule, require more playing space than girls.

GENERAL ARRANGEMENT OF THE BUILDING.

Before any instructions are given to an architect to prepare plans for a new building, consideration should be given to the proposed organisation of the school, the number of masters or mistresses to be employed, the probable size of the classes in the different parts of the school, the relative importance of the teaching of science, art, and manual work; the convenient grouping of the rooms, and the possible use of the buildings, or any part of them, for evening classes or for day instruction in technical or domestic subjects, so that the plan of the building may be fully adapted to the work to be done in the school. A margin of accommodation should be provided, sufficient to secure the necessary elasticity of organisation. The provision of some small classrooms is desirable. The general arrangement of the building should be governed by the endeavour to secure a suitable aspect, effective ventilation for the classrooms, convenience of organisation, and economy in maintenance. The older type of building,

compactly planned with several stories, with a central hall off which the classrooms open directly, is giving place to single-storied groups of rooms, arranged to let the sun and air into every corner. Windows of the ordinary type on one side of the room only, with some form of extract in the chimney or ceiling, and inlet-tubes in the walls, can no longer be considered as providing the best form of ventilation for a classroom. Far more satisfactory results can be obtained by placing windows on opposite sides of the rooms, and so insuring a fresh current of air. The heating surface will have to be increased above that required in the older type of rooms. The general plan of the building will be largely determined by the position of the assembly-hall and its relation to the classrooms; this, therefore, should be carefully considered. A combined room to serve as a gymnasium and assembly-hall is not a satisfactory arrangement. In the style and general treatment of the building every care should be taken to secure economy. The possibility that the school may require enlargement in the future should be borne in mind, and where an early extension is likely to be required the future additions should form part of the original scheme and be included in the plans submitted to the Board.

ACCOMMODATION.

The accommodation of the school is reckoned upon the number of places provided in the classrooms. A lecture-room may be reckoned in assessing the number for which the school will be recognised. The number for which any room will be counted depends not merely upon the area, but also on the lighting, the position of the doors and windows, and the general shape of the room. The details of the accommodation ordinarily required in a secondary school are comprised under the following twenty headings: (i.) Entrances, (ii.) staircases, (iii.) corridors, (iv.) assembly-halls, (v.) classrooms, (vi.) science rooms, (vii.) lecture rooms, (viii.) art rooms, (ix.) housecraft rooms, (x.) handicraft rooms, (xi.) preparatory classes and departments, (xii.) staff rooms, (xiii.) storerooms, (xiv.) dining halls, (xv.) library, (xvi.) music rooms, (xvii.) gymnasium, (xviii.) cloakrooms, (xix.) lavatories, and (xx.) closets.

DETAILS OF ACCOMMODATION.

(i.) Entrances.—Entrances must not lead directly from the outside into an assembly-hall or other room, and must not be used as cloakrooms. An external door, having outside steps, requires a landing between the door and the top step. Entrance doors should open outwards. In schools of more than 150 scholars there should be more than one exit. In schools for both boys and girls there must be a separate entrance for each sex.

(ii.) Staircases.—In schools with more than 150 pupils, if the buildings are on more than one floor, at least two staircases must be provided. Separate staircases must be provided for boys and girls. Every staircase must have at least one external wall, must be of fire-resisting materials, and must be well lighted in every part. Staircases must be not less than 4ft. wide, and must not have more than fourteen steps to a flight. The landings must be unbroken by steps. Treads must be from 11in. to 13in. wide, and risers not more than 5in. to 6in. high. Winders must not be used. In settling the position of the staircase the need for easy access from the hall to the classrooms should be borne in mind. Staircases should be so planned that an easy view can be obtained right up or down.

(iii.) Corridors.—Corridors, which should be for access only, should be from 6ft. to 8ft. wide, according to the size of the school, and well lighted.

(iv.) Assembly-Halls.—The assembly-hall should have a floor-space of at least 6 square feet for each pupil for whom the school is to provide accommodation, and it is preferable that, if the school be for less than 150, a floor-space of 8 square feet per pupil should be provided. It is desirable to place the hall so that noise in it will not disturb

the work in the classrooms. For this reason, as well as for ventilation and freedom from dust, the classrooms should not open directly from it. The hall may, therefore, be altogether or partly detached from the main building. It must be fully lighted, warmed, and ventilated. If it is not possible to provide a room for specific use as a gymnasium, the hall must be made suitable for the purpose of physical training. In this case it should be completely separated from the classrooms, and be so placed that it does not serve as a passage-way from one part of the building to another. If no hall is provided, in addition to a gymnasium, it is desirable to arrange two or three adjacent classrooms with movable partitions, so that they can be thrown into one for purposes of assembly.

(v.) Classrooms.—Classrooms should be provided at the rate of at least four for every 100 pupils. They should not be designed for more than thirty, or less than fifteen, pupils. It is desirable to have one or more division rooms in addition to the regular classrooms, to be taken from 10 to 15 pupils each. A lecture-room, if suitably arranged, may be counted as the equivalent of one classroom. The classrooms must not be passage-rooms from one room or part of the building to another, or from the playground or yard to any room used for teaching or to the hall. The rooms and passages should be so arranged that every room can be cleared easily, and without disturbing any other room. The classrooms should be designed to take single desks, and should have a gangway of not less than 18in. between the rows and between the desks and the wall on each side; a space of 1ft. between the last row of desks and the back wall, and a clear space for the teacher extending the full width of the room of not less than 7ft. 6in. between the front row of desks and the wall. (Each desk may be reckoned as occupying a space of about 3ft. by 2ft.) These dimensions provide a floor area of 16 to 18 square feet per head, according to the size of the class, but in no case must the floor area be less than 16 square feet per head. The proportions of classrooms should be such as to allow a good arrangement of the seats. Long, narrow rooms are to be avoided. If there is a fireplace, it should be placed at the teacher's end of the room in the corner away from the door. The height of classrooms should not be less than 12ft., if it has a flat ceiling. If it is ceiled at the collar-beam the height should be 10ft. to the wall-plate and 13ft. to the ceiling. The ceiling should extend over at least half the area of the room. In no case may a classroom be left open to the ridge. In classrooms arranged with corresponding windows on opposite sides these heights may be diminished by 1ft., where the cross ventilation is adequate. The area of window-glass of classrooms should be approximately one-fifth of the floor space. The windows should be so distributed as to light every table or desk and the whole of the room evenly and sufficiently. The last vertical glass line of the window furthest from the teacher should be on a level with the back of the last row of desks. Where windows are provided in one wall only, this must be the wall on the left of the pupils as seated. Any additional windows should be placed in the right-hand wall, but not so as to throw a stronger light from the right of the pupils than from the left. Windows facing either the pupils or the teacher are to be avoided. Skylights cannot be approved, except in special circumstances, in classrooms. Unless the top of the window be more than 12ft. above the floor, no desk should be more than 20ft. from a window. (a) The lower glass line of the main lighting windows should not be more than 3ft. 6in. above the floor. (b) The tops of the windows should, as a rule, reach nearly to the ceiling. French casements may be approved for some rooms. Windows should never be provided for the sake merely of external effect. Clear glass should be used in the windows, and all kinds of glazing which diminish the light and are troublesome to keep clean and in repair must be avoided. The colouring of the walls and ceilings and

of all fittings in the rooms should be carefully considered as affecting the light. It is advisable to keep the classroom floor level throughout. If a platform is provided for the teacher it should be about 6in. high. Ample blackboard space should be provided, also space for maps and diagrams. In schools where there are a considerable number of older pupils, one classroom at least should be treated as a sixth-form room. Such a room may be furnished with tables suited to the work of the pupils, instead of desks, and may also be used as a library.

(vi.) Science Rooms.—The provision of rooms for science teaching should be carefully considered in relation to the work of the school and the number of pupils.

Laboratories.—A school of 150 pupils over twelve years of age will require at least one laboratory; but in a school of this size for boys and girls two laboratories will, as a rule, be necessary. A school of 200 pupils or more over twelve years of age will require two full-sized laboratories. In schools of 300 pupils or more three laboratories may be necessary. Before the exact dimensions for a laboratory are decided on the arrangement of benches, fittings, drainage, and flues for fume closets and combustion hoods should be determined and should be shown on the plans; but in no case should there be less than 30 square feet per pupil. It is desirable that the laboratory should be large enough to take a full class. The following dimensions will serve as a guide in planning a laboratory: Bench room.—Space for each pupil not less than 3ft. 6in. by 2ft. 3in. Where pupils work opposite each other the double bench may be 4ft. wide. Gangways.—For pupils working back to back, 4ft.; for pupils not working back to back, 3ft. Benches should be clear of shelves. It is very useful to have side bench accommodation not normally used by pupils, but available for special purposes. A demonstration table should be provided. Gas and water should be laid on for benches and demonstration table. The pipes should be accessible. Sinks should be provided.

Additional Rooms.—Where work of an advanced character is done it will often be necessary, and generally desirable, to provide, in addition to the laboratories for elementary work, one or more smaller additional rooms, simply furnished, for advanced work. All the science rooms should, if possible, be close together and conveniently accessible from one another. A separate balance room for the balances ordinarily in use is not necessary. When such a room is provided there is usually a good deal of overcrowding, and supervision is rendered difficult. In larger schools it is generally found advantageous to have a preparation room; in all schools it is necessary to have ample space for storage of apparatus and materials both in the laboratories themselves and in an adjacent room or rooms. In many schools it has been found easy to provide a separate dark-room. This room may conveniently be fitted for photographic purposes. Even where a dark-room exists it will often be desirable that arrangements should be made for partially darkening a laboratory, when necessary, for practical work in optics. A botanical laboratory need not differ in size from an ordinary laboratory for elementary chemical and physical work; but it should have an aspect that will secure plenty of sunlight for growing plants. It will be found useful to provide a narrow bench under the windows, about 2ft. wide, for physiological experiments and such other work as requires a specially good light. The benches may be plain tables, providing 3ft. 6in. by 2ft. or 2ft. 6in. for each working place, fitted with gas. Sinks should be provided. A demonstration table, fitted with water and gas, should be provided. Wall space should be utilised for reagents and apparatus. It may be convenient to have one bench 4ft. long, with reagent shelves above it. Greenhouse accommodation is desirable, and some arrangement for the germination of seeds.

(vii.) Lecture Rooms. In schools of 200 and over it is useful to provide one or more

lecture rooms, or a classroom fitted with a demonstration table, so that it may be used for lecture purposes. In smaller schools lecture rooms may be omitted. A lecture room should ordinarily accommodate thirty pupils, the last three or four rows of desks being raised; a large demonstration table should be provided, and the room made capable of being easily darkened for lantern-work. In big schools a larger room may be provided, constructed, if desired, on the principle of a theatre, with rising seats. There must be a floor-space of not less than 14 square feet per pupil for the first thirty pupils, and 12 square feet for each pupil above that number. Windows must not be placed facing either the teacher or the pupils.

(viii.) Art Rooms.—A room for teaching drawing should provide not less than 30 square feet per pupil; a suitably shaped room would be 25ft. by 30ft. In schools of over 300 it is desirable to provide a supplementary room for crafts and modelling, or separate rooms for advanced and elementary work. The room should be lighted by a large window to the north, as far as possible in one length, not broken up by wide piers; the top should be carried close up to the ceiling. Any other windows should be fitted with light-excluding blinds. The room should be provided with a sink and have water laid on. In schools for 100 or less the hall, if suitably lighted, may be used for drawing.

(ix.) Housecraft Rooms.—The room provided for housewifery, laundry, and cookery classes should allow 30 square feet of clear floor space for each pupil under instruction at any one time. In addition, space is required for fixed apparatus, which may be roughly reckoned at about 5 square feet per head. A suitable number of pupils for a housecraft class is 15 to 18; in no case should more than twenty be taken together. A north aspect is desirable; special arrangements should be made for ventilating, and where necessary for warming the room. The room should be so placed that smells from cooking will not penetrate into other parts of the school. A larder should be provided, the window of which should face north or east. It is convenient to have two cooking ranges, one open and the other closed, to one of which a back boiler should be attached. Where gas is available, a gas-stove, provided with a flue-pipe to carry off fumes from the oven, should be fixed in a convenient position accessible on at least three sides. Where a gas hot-plate is provided, it may be separated from the oven, and should be set at a height of about 2ft. 6in. from the ground. In cases where electricity can be used with economy, it may be desirable to introduce an electric stove. At least one sink, not less than 3ft. in length, with draining-boards and hot and cold water laid on, should be placed in full view of the teacher and pupils, also a slop sink 12in. deep. Fixed furniture is undesirable; movable tables providing 2ft. per pupil, with two additional tables, are needed. A convenient size for the tables is 6ft. by 2ft. 6in. wide by 2ft. 6in. high. In selecting them regard should be paid to their convenience for needlework purposes. For laundry work a copper holding from 12 to 18 gallons is essential; there should be a supply tap above the copper, and also a tap for emptying it. Storage accommodation, such as shelves, racks, and cupboards, is required. Suitable seats should be provided.

(x.) Handcraft Rooms. In every school there should be, and in every boarding-school with more than twenty boarders there must be, a handcraft room, which should provide for the instruction at one time of not more than fifteen or more than thirty pupils. The latter number will require about 900 square feet of floor area. There should be a space of at least 4ft. in width between benches, and a clear space round every bench for woodworking. A rack for tools should be provided for every bench. In its plan, arrangements, lighting, and ventilation a room for teaching handcraft should be modelled on a workshop rather than on a school. The roof may be either of lean-to or other ordinary form according

to circumstances. Its height at the windows in front of the benches need not be more than 9ft. A flat ceiling is not, as a rule, necessary. The lighting and ventilation must be ample. The room must be warmed, but need not be so warm as an ordinary classroom. The floor should be of wood-blocks or some other material that will not damage tools dropped upon it. Provision for black-board teaching should be made.

(xi.) Preparatory Classes and Departments.—If a kindergarten or preparatory class is attached to a school, it should be taught in a light, airy room or rooms, facing south or south-east, and so arranged as to provide an easy way into the open air. The room should have a fireplace. Wall blackboards for the use of the children and ample cupboard accommodation should be provided. The class should have its own lavatory, offices, and cloakroom accommodation. Where the preparatory department is large a separate block of buildings is often, and in boys' schools a separate playground is always, desirable.

(xii.) Staff Rooms.—The head master's or head mistress's room should be placed conveniently near the entrance, and be provided with a lavatory and closet. Some provision for persons waiting for interviews is desirable. In schools for both boys and girls, under a head master, a separate room is needed for the senior assistant mistress, as well as separate common-rooms for the staff of each sex. It is advisable to place these rooms in a position facilitating supervision over the playgrounds, access to lavatories, etc. Adequate cloakrooms, lavatories, and closets should be provided in connection with these rooms, apart from those provided for the pupils.

(xiii.) Store Rooms.—There should be sufficient space for storage; this can be most economically provided by designing cupboards as part of the buildings.

(xiv.) Dining Halls.—In every school an estimate should be made of the number of day pupils who may be expected to dine at the school or bring their own meals, and dining accommodation should be provided accordingly. Not less than 2ft. should be allowed for every pupil at the table, and not less than 10 square feet of floor area. The kitchen and offices, which should include a larder and pantry, should be adjacent to the dining-hall, with separate entrance, and so placed that the smell of cooking will not be likely to enter the school.

(xv.) Library.—In every school it is essential that there should be a room furnished for use as a library, in which pupils can have facilities for consulting and working from books of reference. This room may also be used as a sixth-form room.

(xvi.) Music Rooms.—In every school in which instrumental music is taught it is desirable to have a music classroom, unless there is a lecture or other room that can be conveniently used. Practice-rooms should be about 8ft. by 6ft. 6in., divided by sound-proof partitions, and with soundproof doors. Music and practice-rooms, if provided, should be as much isolated as is practicable.

(xvii.) Gymnasium.—A suitable size for a gymnasium is 60ft. by 30ft.; in no case should it be less than 50ft. by 25ft. It should be constructed with a flat ceiling 16ft. from the floor and lighted by a continuous range of windows down each side; these windows should have the underside of the sills not less than 9ft. from the floor, and be hung on centres to swing open. At least one end wall should be left blank. The entrance for the ordinary use of pupils should be through a lobby and changing room, so that outdoor boots and shoes are not brought into the gymnasium. The floor should be resilient and to a certain degree resonant; solid floors are therefore unsuitable. Narrow boards running across the room laid on joists will be found the most suitable. Some means of warming must be provided. It is often feasible and desirable to erect a gymnasium of light and cheap construction, separate from, but in convenient connection with, the main school building.

(xviii.) Cloakrooms. In schools for boys and girls there must be separate cloakrooms

for each sex. Cloakrooms should be placed conveniently near the pupils' entrances, and if possible near the pupils' offices. They should be entered from properly lighted and ventilated lobbies, and not from any room used for teaching. They must not be used as passages. As cloakrooms are frequently locked up, it is undesirable to place the lavatory basins in them. They should be heated, in order to dry damp cloaks, and well ventilated, to insure that no smell is carried into the school. Cloakrooms should be amply lighted from the end. The floors should be of asphalt or other impervious material, and the walls of tile or other hard material, or at least with a dado 5ft. high of such materials. It is very desirable to provide a small drying-room for wet cloaks. In schools to be used also by evening classes some part of the cloakroom accommodation and offices should be effectively separated from the rest for the use of the evening pupils. Equipment should be provided on the following scale: Boys.—Cloakroom pegs, 10in. apart, in one horizontal row only. Girls.—Cloakroom pegs, 15in. apart, in one row only, with seats for changing boots and wire boot-racks. For both boys and girls a space of 5ft. is required between the stands.

Changing Rooms.—In large schools it is desirable to provide changing-rooms, which should be fitted with fixed seats, pegs, lockers, and boot-racks. Provision for foot and spray baths may be made. In small day-schools accommodation for changing may be provided in the cloakroom.

(xix.) Lavatories.—The lavatory may serve as access to the closets. Lavatory basins should be provided on the following scale: Boys.—One for every 20 pupils up to 100, and one for each succeeding 25, 18in. being allowed to a basin. Girls.—One for every 10 pupils up to 100, and one for each succeeding 20, 18in. being allowed to a basin. A lock-up slop-sink, water-tap, and cupboard for use by the caretaker are desirable.

(xx.) Closets.—The girls' offices should always be in the main building, but suitably isolated; if this is not possible, they should be connected by a covered corridor. Privacy of access must always be secured. The boys' offices should be completely disconnected from the school. In schools for both boys and girls the offices and approaches to them must be wholly separate for the two sexes. Every closet must be not less in the clear than 2ft. 3in. wide, nor more than 3ft. Each must be fully lighted and ventilated, and have a door. The door should be at least 3in. short at the bottom, and at least 6in. short at the top. The closets are best divided by partitions carried up 6ft. only. The walls should as far as possible be treated with some smooth hard surface upon which writing is impossible. Each closet must be fitted with its own flushing apparatus. The number of closets required is: Boys.—One for every 25. Girls.—One for every 15 up to 100, and one for each succeeding 20. In unials separate stalls are desirable. One stall should be provided for every 15 boys up to 100 and one for each succeeding 20. The arrangement of drains should be in accordance with approved modern practice.

BOARDING HOUSES.

It is necessary that a boarding school should provide ample space for games and recreation. Suitable and adequate accommodation should be provided for resident members of the staff. The pupils may be provided for either in dormitories or in cubicles. Dormitories should contain not less than three beds; there should be a space of at least 3ft. between beds. In girls' schools, cubicles for all girls over twelve years of age must be entertained or partitioned. A floor area of not less than 65 square feet and a cubic space of 700 cubic feet must be provided for each occupant. Ventilation must be adequate, and a thorough current of air should be provided, by arranging the windows on opposite sides of the room. Cubicles, if formed out of a dormitory by partitions not carried up to the ceiling, should provide the area required above; each cubicle must have its own window. If the partitions are carried right up, not less than

100 square feet floor area will be required. Closet accommodation for night use must be provided within reasonable access of each dormitory. The rooms for matron and staff should be so placed as to provide for easy supervision of the dormitories. An aspect that allows the sun to enter the rooms freely should be chosen—south or south-east being preferable. All dormitories must have alternative means of escape for use in case of fire. The provision of chemical fire-extinguishers is not advisable. The washing arrangements may consist of either ordinary hand-basins in the dormitories, or, in the case of boys' schools, lavatories placed conveniently near; in the latter case each pupil should be provided with a small rack and towel-rail. Fixed lavatory basins should not be fitted in sleeping rooms. There should be baths at the rate of two for every twenty boarders, with separate bathroom provision for the staff. A good plan for daily use is to have a room with a floor of asphalt, lead, or other impervious material, with taps and movable baths, or shower-baths. Two shower-baths divided by waterproof curtains or partitions will occupy the space of one slipper-bath, and can also be used more expeditiously. A downstairs changing-room and a separate lavatory for day use, in connection with it, should be provided. The number of closets required for day use is one for every seven boarders. Every boarding school or house must have adequate day-room accommodation; these rooms should provide not less than 20 square feet for each boarder. There should be a separate sitting-room, or bedroom furnished as a sitting-room, for each member of the resident staff, also a matron's sitting-room and linen-room. In every boarding school there must be a sickroom, properly isolated. In a sickroom the beds must be free of the walls. There should be a space of not less than 6ft. between beds, and, if possible, a window between every two beds, the windows being opposite to each other. All internal angles of walls, floors, and ceilings should be rounded. There must be in a sickroom 1,000 cubic feet for each bed. Water-closets and bathroom, with hospital bath, should be provided, with aerial disconnection from the sickroom. In boarding schools of more than 50 boarders provision for infectious cases should be made in a separate building, as far from the main building as can conveniently be arranged. A room for the nurse should be provided, adjoining the sickroom. The head master's house, if any, should be planned as a private residence, with accommodation for a family. It should be entirely separate from the accommodation for boarders. For the head mistress in a girls' school proper and self-contained apartments, with reception-rooms, should be provided.

VENTILATION AND HEATING.

Adequate means for ventilating all rooms used for teaching must be provided, not only for admitting fresh air during use, but for flushing the rooms effectually during the intervals. The inlets for fresh air should be large and well distributed, and be provided with some arrangement to divert the incoming air from striking directly on to the pupils and teachers. In order to insure a sufficient movement of the air, there should be openings on opposite sides of the room, and these should be into the outside air. Where the rooms are properly cross-ventilated, ceiling extracts will not be required. One of various economical and effective plans is to have the lower panes of the windows arranged to open inwards, as "hopper" inlets with side pieces, the upper parts of the windows being hung on centres to swing, in order to give as large an opening as possible. The windows should be arranged so that at least half their area can be open at once. They may be arranged so that the whole space can be open. Openings behind hot-water radiators and ventilating grates are useful adjuncts in cold weather, but do not obviate the need for an ample supply of properly constructed opening windows. Combined systems of heating and ventilation in which air raised to a sufficient degree to warm the rooms is used for ventilation are not generally desirable in a school. The

stimulating and invigorating effects of fresh, cool air are lost, and the pupils become accustomed to sit with closed windows. In buildings of more than one story the ventilation requires particular attention. As far as possible, long trunks and flues for the admission of air, which are difficult to keep clean, should be avoided. Outlets opening into chimney-flues or ceiling ventilators do not work well without some mechanical aid. Generally, the best results will be obtained by providing ample heating power, and making full use of well-arranged windows to secure cross-ventilation. The heat supplied to the school should be moderate and evenly distributed, so as to maintain a temperature of from 56deg. to 60deg. in the rooms. Where windows are provided on two sides of a room, 25 to 30 square feet of heating surface per 1,000 cubic feet should be secured. In a large room heated by an open fire the heating should be supplemented by hot-water pipes on the side furthest from the fire. When the heating is by means of hot water it should be at medium or low pressure; high-pressure water and steam heating cannot be approved. Slow-combustion stoves with long flue-pipes cannot be approved. Gas radiators or stoves are not approved for warming rooms used for teaching unless they are provided with flues. Windows which face the sun should have blinds.

CONSTRUCTION AND MATERIALS.

(i.) Permanent Buildings. — The whole space within the area of the building should be covered by a layer of concrete not less than 6in. thick, and if solid floors are not used, air bricks should be inserted in opposite walls. Except where hard rock, gravel, or chalk bottom is found, concrete foundations must be provided under all new walls. If the external walls of a school are of brick, they should be at least one brick and a half thick; if of stone, they should be 20in. thick. Where hollow walls are proposed, one wall should be at least 9in. thick, with a 2in. cavity between it and the other wall. All walls, not excepting fence-walls, should have a damp-proof course just above the ground line. For single-storied buildings the Board will be prepared to consider proposals for walls of less thickness, as, for instance, a 9in. solid brick wall or an 11in. hollow brick wall, strengthened where necessary with piers. Such walls should be treated with roughcast or cement, or, in the case of hollow walls, a second damp-course should be placed in the inner wall one course of bricks above that through the whole wall. Great care should be taken to render the roofs impervious to cold and heat. Roofs open to the apex are not approved. All classrooms must be ceiled either at the wall-plate or not less than half-way up the roof. In a school of more than one story, special care must be taken to render the floors as far as possible soundproof and fireproof. Solid floors should be used on the ground floor.

(ii.) Temporary Buildings. In special circumstances the Board are prepared to sanction the erection of schools of a lighter and less permanent construction. When such buildings are proposed for recognition for a considerable period, they must be placed upon properly constructed brick foundations, with concrete under the floors, and conform generally to the requirements of an ordinary school building. When a wooden building is proposed the wood should be chemically treated under pressure. In iron buildings careful precautions are required to guard against extremes of temperature, and unless the building is purely temporary it is well to roof it with some form of thin non-conducting tiles. In any case a ceiling should be provided with an air space between it and the roof. The walls should be lined with felt or some other material capable of absorbing heat and of giving protection against cold.

WATER SUPPLY.

In all schools adequate and wholesome drinking water must be readily accessible by the pupils. There should be no direct communication between any pipe or cistern from which water is drawn for domestic purposes, and any water-closet or urinal. Any cistern

to be used for the storage of water should be watertight and be properly covered and ventilated, and should be placed in such a position that the interior may be readily inspected and cleansed. Where waterpipes are used they should be so laid or fixed as to be properly protected from frost. Provision should also be made for completely emptying any exposed pipes and cisterns. All water-closets and urinals should be provided with proper service cisterns, which, together with the outlets from them, are capable of providing a sufficient flush.

PLANS AND PROCEDURE.

The Board may refuse to recognise a school if in their opinion the principles set out in the above regulations have been departed from unnecessarily. Before they recognise enlargements or alterations of premises which have been already recognised, the Board must be satisfied, by the submission of properly drawn plans and estimates, that the proposals are satisfactory. In cases where the immediate erection of the whole building is not proposed, the portions not to be carried out at once should be clearly indicated. Duplicate copies of the block plan and of the plan of each floor must be sent for retention by the Board. The Board expect that in respect of sanitary matters the plans will come up to the standard set by the Local Government Board's model by-laws, or that departures from that standard will be specially indicated and justified.

Requirements as to Plans.—The plans and other information to be furnished in support of proposals for new buildings or for improvements of existing buildings include a block plan of the site, drawn in ink to a scale of 20ft. to an inch; a plan of each floor of all the buildings drawn in ink to a scale of 8ft. to an inch; sections and at least four elevations, also drawn in ink to a scale of 8ft. to an inch. There must also be furnished a concise description of the buildings, and of the various rooms, with their dimensions and uses; a specification; and an estimate of the total expenditure proposed.

THE COST PER HEAD OF SANATORIA.

At their last meeting the Kent County Council received a committee's report stating that twenty-two tenders had been received for the erection of the Leatham Sanatorium. The lowest tender was for the sum of £19,860; but this had now been withdrawn. This left the tender of Messrs. West Bros., of Rochester, for £20,860, the lowest. The committee recommended the council to accept this tender. The building being one for 125 beds, the tender worked out at about £167 per bed for all the work covered by the specification. To this must be added the cost of the land and the redemption of the land tax (which, with expenses, was £1,618 18s. 3d.), the cost of furnishing (estimated approximately at £10 per bed) and the cost of providing the water-supply, of planting and laying out the ground, and the architect's fees (5 per cent. on the cost), and the wages of the clerk of works. It was obvious that the total cost would not be less than £200 per bed. On the other hand, added the Committee, the Local Government Board had informed them that while they recognised that the capital cost must vary, "it should probably not, as a rule, exceed £150 a bed, inclusive of cost of site and equipment," and proceeded to recommend that "capital grants should be made up to three fifths of the cost per bed, provided that the total sum does not exceed an average of £90 per bed." The committee recommended that the council should apply to the Local Government Board for a capital grant of three fifths of the actual expenditure. Even if such increased grant were made, the council's expenditure would be about £80 per bed, instead of the £60 per bed which county councils would be to suppose would be their maximum expenditure.

Alderman Earl Danby, in moving the adoption of the report, offered the council an explanation of the large difference between the probable actual cost per bed of the new sanatorium and the estimate on

which the committee had been relying—£150 per bed—given by the Local Government Board. The cost per bed, allowing for all expenses that could be thought of, was £203 per bed—or no less than £53 per bed more than they were led to expect. Their committee selected as their architect, Mr. Edwin T. Hall, of Bedford-square, London, a man of great experience, who said at the outset that no institution that he had ever heard of—and he apparently knew all the institutions of the kind in this country—had been erected at £150 per bed; but if it was humanly possible he would undertake that it should be done at that figure. When the plans were produced the sub-committee who dealt with the matter were satisfied that Mr. Hall had carried out economy to the highest extent compatible with the comfort and security of the inmates of the building; but it was apparent that this £150 per bed would be considerably exceeded, and the final estimate of the cost was increased, as he had already said, to £203 per bed, made up as follows: Purchase of land and redemption of land tax, £1,620; furnishing, at £10 per bed, £1,250; architect's fee at 5 per cent. on the cost, £1,050; clerk of the works, £200; planting, £200; contract for building, including generating plant, laundry, sewage disposal, roads, etc., £20,860; capital cost of laying on water, £250; making in all £23,435, or just about £203 per bed for 125 beds. Lord Darley quoted figures to show that the sanatorium would be built at a much less cost than many other similar institutions, among them being Liverpool, £375 per bed; Frimley, £374; Worcester, £320; Ipswich, £250; Eastbourne, £266; South Wales, £221; and North Wales, £220. The committee, his lordship added, recommended the council to apply to the Local Government Board for a grant equal to three-fifths of the actual expenditure, and to protest very strongly against the Board having fixed so inadequate a limit as £150 per head.

A long discussion ensued, many members being in favour of an amendment proposed that no new building contracts be entered upon, and that all departments be as sparing as possible in the expenditure. It was stated that the standing joint committee had decided that morning not to invite tenders at present for the erection at Maidstone of the new county police headquarters, which were to cost £25,000; but eventually Messrs. West Bros.' tender for Lenham Sanatorium was accepted, and the committee's recommendation to apply to the Local Government Board was adopted by a substantial majority.

BITUMINOUS CONCRETE.

Mr. Linn White, civil engineer for the South Park Commissioners, Chicago, has arrived at the following conclusions as to bituminous concrete: (1) Bituminous concrete and bituminous macadam of equal thickness require the same amount of bitumen per square yard. (2) Considering the total thickness of wearing surface and base, and disregarding first cost of plant, the only difference in cost between bituminous concrete and bituminous macadam is the difference in labour, amounting to generally less than 10 cents per square yard. (3) Old macadam is a difficult and uncertain proposition to penetrate with poured bitumen on account of dirty stone, and generally requires a new top layer of stone to produce a successful bituminous macadam, but if of substantial thickness may be utilised as a base for bituminous concrete. (4) The mixing and laying of bituminous concrete may be carried on during damp and cool weather when it would not be practical to construct bituminous macadam. (5) Bituminous concrete is of even thickness and even composition, and, consequently, wears more evenly than bituminous macadam, no matter how well made, and costs less for repair and maintenance. In all these respects the advantage of comparison is in favour of bituminous concrete, except in the one of first cost.

Mr. A. Dryland, the county surveyor of Surrey, has received an increase of salary

PATENT COTTAGES.

The following plans have been patented by Mr. J. S. Fairfax, Holborn Hall, Gray's Inn-road, London:—

Cottages, either semidetached, as shown in Fig. 3, or detached, are formed on the ground

floor with a front room, *b*, and a back room, *a*, of equal width, but not necessarily of equal lengths, the lengths being at right-angles; an entrance-hall, *d*, in the angle between the rooms, and a staircase, *c*, starting with three railed-in winders, and having a side partition forming a cupboard beneath and continued into the room *a* to form a larder.

The first floor comprises three bedrooms, *g*, *h*, *i*, and a small room, *j*, each with a separate entrance from a landing, *f*. A scullery, *p*, a coal cupboard, and a closet are provided at the rear of the kitchen.

The walls are built of hollow blocks, shown in Fig. 9, and approximately 7in. by 9in. in cross-section and 12in. long, so that the walls may be either 7in. or 9in. thick. Special recessed blocks are provided to receive the floor and ceiling joists, as shown in Fig. 11, and the top blocks are cut away to take the rafters.

For angles and cross-walls, L-, T-, and X-shaped bricks are used. The hollow walls may be used for ventilation and heating, and glass bricks may be used for lighting.

OBITUARY.

We regret to have to announce the death of Mr. Charles Mewès, Diplômé par le Gouvernement Français, Arbitre près le Tribunal de Commerce, S.C. Mr. Mewès was the senior partner of the firm of Messrs. Mewès and Davis, architects, 39, Maddox-street, Hanover-square, W. He also practised in Paris and Cologne; in the latter town he was in partnership with Monsieur Alphonse Bischoff. With Mr. Arthur J. Davis, F.R.I.B.A., he was responsible among other work for the following buildings, etc., in England:—The Ritz Hotel, Piccadilly (illustrated in our issue of March 3, 1905; half-a-dozen specially designed keystones in the principal facade were shown in our number for June 1, 1906); the "Morning Post" offices, Strand; the Royal Automobile Club, Pall Mall (Mr. E. Keynes Purchase, F.R.I.B.A., was joint architect for this building, which was illustrated by plans and elevations in our issue of April 23, 1909); decoration of s.s. "Aquitania" for the Cunard Steamship Co., Ltd., consulting architect to the Cunard Steamship Company, for their new building in Liverpool; decorations of s.s. "Amerika," for the Hamburg-American Line; new theatre and boxing hall for the National Sporting Club, Ltd.; the Cavalry Club, Piccadilly (extension); the Cunard Steamship Company's offices, Coekspur-street; the Carlton Hotel, remodelling and decorating interior; the Hyde Park Hotel, internal alterations and decorations; extensive alterations and decorations at No. 1, Belgrave-square; S.W. for Mr. W. Koch, 49, Belgrave-square, for Mr. Otto Boll; 8, Grosvenor-square, for the Hon. Henry Coventry; 37, Grosvenor-square, for Mr. Robert Fleming; 18, Grosvenor-square, for Mrs. John Astor; Luton House, Luton, for the late Sir Julius Wernher, Bart.; Polesden Lacey, Dorking, for the Hon. Mrs. Ronald Greyville; Coombe Court, Kingston Hill, Surrey, for the Most Hon. the Marquis

of Ripon; Glanusk Park, Brecon, for the Right Hon. Lord Glanusk; also decorative work at 11, Portman-square, W., for His Grace the Duke of Beaufort; 27, Portman-square, W., for Mr. Ernest Cunard; Stafford House, for Cora Countess of Stafford. Mr. Mewès executed the following works from his office in Paris:—The Ritz Hotel, Paris; Palais des Congrès International Exhibition, Paris, 1900; Chateau de Rochfort; Credit Foncier, Rue Cambon (now in course of erection); house for M. Jules Ferry; house for M. Lucien Guity; extensions Grand Magasins du Louvre; block of flats in the Clamps Elysées, etc. In Spain Mr. Mewès carried out, in conjunction with Mr. Landeche:—The Ritz Hotel, Madrid; Esplanade San Sebastian. From his office in Cologne, in partnership with Monsieur Bischoff:—House for Herr Oppenheim; Esplanade Hotel, Hamburg; house for Herr von Guillaume; fittings and decoration of s.s. "Kaiserin Augusta," s.s. "Imperator," and s.s. "Vaterland," for the Hamburg-American Line. Together with his partner, Mr. A. J. Davis, Mr. Mewès took an active and personal interest in the organisation and work of the First Atelier in London, of which he and his partner were joint patrons. Mr. Mewès had for some years been a widower.

To our notice last week of the death of Mr. John Brooke, F.R.I.B.A., the senior partner in the firm of John Brooke and Eleock, of Manchester, we may add that Mr. Brooke was a pupil of Mr. Frederick Bakewell, architect, of Nottingham, and on the completion of his articles went to Manchester at the age of nineteen. For a few years Mr. Brooke was a partner in the firm of Corbett and Son, of Manchester, but at an early date he began practice on his own account in Exchange-street, Manchester, where he remained for over thirty years. In 1912 he assumed as partner Mr. C. E. Eleock, F.R.I.B.A., of Glasgow and Liverpool. Mr. Brooke's ability was recognised by his appointment as assessor of many important competitions and arbitrations. He had been a member of the Constitutional Club, Manchester, and of the Old Rectory Club, and was a member of the Lancashire Cricket Club, in which he took a great interest. He had been a widower since 1902 and leaves four children: Mrs. Robertson Duncan, of Shanghai; Mr. T. Wynyard Brooke, A.R.I.B.A., of Messrs. Davis and Brooke, architects, Shanghai; Mrs. Arnold Wolf, of Hale; and Mr. F. R. R. Brooke, Royal Artillery, Woolwich, the well-known Lancashire cricketer.

Mr. Robert Francis Harper, Ph.D., Professor of Assyriology at Chicago, has died suddenly in London, in his fifty-ninth year. A native of Ohio, Dr. Harper had been instructor at Yale University from 1886 to 1892, when he was appointed Professor of Assyriology at Chicago, where he graduated. In 1906 he became Director of the American School of Archaeology at Jerusalem. He published the texts of the Assyrian Letters and Reports of the reigns of Sargon, Sennacherib, Esarhaddon, and Ashurbanipal, preserved in the British Museum. Thirteen volumes have been published, and Professor Harper was finishing the fourteenth at the time of his death. A fifteenth volume, dealing with Assyrian Paleography, had been planned, and these two final volumes will be duly edited by others and issued.

Mr. J. H. Harris, of Chatham, has been appointed borough surveyor and inspector of nuisances to the Penryn Town Council.

Mr. R. Angus has been appointed to the post of inspector of roads and streets under the Aberdeen Town Council. The salary is £200 per annum.

The Weston-super-Mare Improvement Bill, sanctioning the provision by the urban district council of a new water supply, the acquisition of land for cemetery extension, and other important schemes, has received the Royal Assent.

The town council of Ryde has rejected a proposal to tar-spray some of the principal thoroughfares in the borough, as the members consider that the yellow gravel now used on the roads contributes to the bright appearance of the town.

Currente Calamo.

The R.I.B.A. and the Architectural Association are promptly to the fore with suggestions for national help, as will be seen by the two communications from Mr. Ernest Newton and Mr. Maurice Webb, which we print elsewhere. The suggestions are practical, and we hope there will be a hearty response at the meeting of the R.I.B.A. which is to be held this afternoon at 9, Conduit-street. The second suggestion tabulated by the President of the R.I.B.A. is an eminently timely one. Fraternal co-operation will effectively facilitate that which at the moment should be the chief aim of all of us just now—namely, the maintenance in full force and energy of "Business as usual," as Mr. H. E. Morgan happily phrases it.

We are glad to find that our anticipations last week with regard to the possible effects of the war on our own industries were not unduly optimistic. The seven-months' dispute in London has been settled on terms creditable to both sides. The terms last submitted by the London Master Builders' Association to the several trades-unions have been accepted, with a reservation of the clauses relating to disability and to foremen, as well as the rate of wages to timbermen, and alteration in overtime rates for labourers, for the Augmented National Conciliation Board's final decision. That, of course, has ended the possibility of any general lock-out throughout the country. During the week work has been resumed in London as fast as the seven-months' hindrances in various directions would allow, and it now only remains for all concerned to pull together heartily to keep things going.

Pessimists last week suggested that unemployment would be increased by the suspension during the crisis of building and engineering operations provided for in the estimates of the Office of Works recently approved by Parliament. We did not believe for a moment that any such action would follow, and we are glad the First Commissioner of Works quickly announced that his Department will proceed with all services, employ as many men as possible to carry out such services, and develop and expedite the Government's building programme in any way practicable. We very earnestly endorse the First Commissioner's appeal to private individuals, companies, firms, and contractors to spare no effort to follow the policy of the Government in this matter. We trust also that all concerned will encourage all manufacturers and merchants who are doing their best to maintain the necessary supply of material of every description. There are few, if any, branches, in which this will be found impossible, and buyers hereafter will not forget the enterprise of firms which rise to the occasion.

The reintroduction of the Housing Bill by the Government—which, it will be noticed, is creditably pushing ahead with its other building work—is a right step. As Mr. Samuel very aptly remarked last Saturday, it will enable assistance to be given in any direction which is necessary, and is in no sense £4,000,000 devoted to the relief of distress. It will be spent to build houses which will exist at the end of this crisis, and

bring in revenue. It is a desirable and profitable investment and in no way a mere charitable grant. It is also prudent and proper that the Local Government Board does not contemplate setting up in London a branch for letting contracts or building houses in Manchester or Liverpool. What will be done is to arrange with the public utility societies and the local authorities for taking the necessary measures to provide for the necessities of their own districts. It remains now for other bodies to supplement the initiative of the Government to the utmost.

Manchester is setting a good example to all local authorities. The Manchester and Salford House Famine Committee, at a meeting last Monday night, recommended the city and borough councils immediately to proceed with schemes for erecting houses for the working classes. The resolution pointed out that these schemes would not only provide work, but would be "a valuable contribution to the solution of the housing problem, and would make a permanent addition to the assets of the community." The Manchester sanitary committee have one housing scheme which has been approved by the city council, and now awaits the approval of the Local Government Board. It provides for the erection of forty tenements in St. Michael's Ward. The committee will also present to the next meeting of the city council a proposal for the building of 130 cottage flats on the Temple-street estate, Cheetham Hill. Both these schemes, with the goodwill of the council and the Government department, might very soon be put in hand. There is, further, the extension building scheme for the Blackley estate. Some time back the sanitary committee was authorised to obtain competitive plans for the building there of fifty semi-detached cottages to let at rents varying between 5s. 6d. and 7s. 6d. The competition has taken place and the awards been made, and there is no reason why this scheme should not be accelerated.

It is stated that the Metropolitan Asylums Board has suspended permits to fish in its reservoirs. Undoubtedly a wise precaution at the present time, and one, we are inclined to think, from our own acquaintance with and observation of one of the largest near town, which might be maintained, except in rare cases, in the future. Mr. Ernest Phillips, in a recently published book on "Trout in Lakes and Reservoirs," points out that where fishing is permitted in reservoirs there is some chance of contamination. Worms and gentles are frequently used, and ground-bait of an unsavoury character. The possibility of pollution by the excrements of fishermen is certainly not to be overlooked. It is quite possible that a typhoid carrier might thus pollute the water near the outlet of a reservoir. Dr. Houston tells us that "if a typhoid carrier micturated in the river above the intakes (say from a boat), the typhoid germs, in the absence of storage, would be carried directly on to the filters, with consequences which could hardly be other than calamitous. Even if water is polluted with as much as from 0.001 to 0.0001 per cent. of crude sewage, the chances of typhoid bacilli being uniformly present are extremely remote . . . but a water polluted with extremely small traces of typhoid urine would probably suffice to produce a serious epidemic." Fishing certainly should never

be allowed without the sanction of the water authority's bacteriologist.

Our Canadian contemporary the *Contract Journal* comments severely on a competition scandal at Vancouver. It declares that "it has remained for the city of Vancouver to provide, in one flagrant example, an embodiment of all the evils attendant upon engineering and architectural contests." Last spring the Vancouver City Council invited competitive plans for the new causeway and seawall at Coal Harbour, and designs were received from twenty-three competitors. In the conditions sent out the competitors were asked to provide sufficient details to enable the city engineer, Mr. Fellowes, to check the designs in regard to the strength and stability of the proposed work. It was stipulated that the designs should conform in line and grade with the plans supplied by the city engineer. Competitors were requested to withhold their names from the plans, specifications, and estimate. A clause was inserted to the effect that disregard of the conditions would entail disqualification. The rate at which the successful engineer would be recompensed was stipulated carefully.

In the end, it seems, the plans of the city engineer have been approved and accepted by the Vancouver City Council—and this in the face of strenuous objection on the part of the Canadian Society of Civil Engineers and the Architectural Institute of British Columbia, to say nothing of a united protest from the twenty-three competitors. From the evidence offering, our contemporary says, "We do not hesitate to commit ourselves unequivocally in condemnation of the fact that the city engineer compiled the regulations governing the competition, assumed the part of technical expert in judging the designs, and finally became a competitor, thereby, in the last-named regard, violating one of the essential parts of the competition." We have, of course, no knowledge first hand ourselves, and it is right to say that in defence of his own work and of the council's selection, the Vancouver city engineer urges that the modified plans submitted by him were conceived and prepared before he had examined the competitive designs, and that he had no previous knowledge of their structural arrangements. If that is so, it is the more shameful that twenty-three men were put to the cost of four or five thousand pounds in the aggregate to prepare designs for work which the city had determined its own engineer should carry out.

We hope it is hardly necessary to advise architectural students, if they would avoid arrest on charges of espionage, to be careful where they sketch and photograph. A too-zealous policeman or Territorial officer might occasion them considerable inconvenience while the war lasts. From South Hampshire we have received a well-authenticated narrative—not from the correspondent of a halfpenny London evening newspaper of a young man who, while sketching from near a railway bridge, was seized by a county constable and conveyed to the police station. There it was found that the artist's sketch-book was full of innocent views of meadows and Gothic architecture, so he was soon released. But his adventures should act as a warning to others.

PARLIAMENTARY NOTES.

THE HOUSING BILL (No. 1).—In the House of Lords, on Saturday, the Housing Bill was passed, after the insertion of an amendment moved by Lord Lucas, President of the Board of Agriculture, applying the provisions of the measure to the case of all persons in the employment of the Government, and not only to those employed on Government works. The measure received the Royal Assent on Monday.

HOUSING (No. 2) BILL: EMPLOYMENT FOR THE BUILDING TRADE.—In the House of Commons, on Saturday, the Right Hon. Herbert Samuel, President of the Local Government Board, asked leave to introduce a Bill to

time.—The second reading of the Bill took place on Monday evening.—Mr. Herbert Samuel, replying to various questions and suggestions by Mr. Walter Long, Lord Robert Cecil, and others, stated that it was not the intention of the Government Departments concerned themselves to build where they could get the work undertaken either by local authorities or public utility societies. He was ready to accept an amendment providing for full local inquiry. It was the intention that houses and cottages should be let at economic rent. But he wanted to make it plain, in view of the fact that it might be difficult at this juncture to borrow money at the usual rates of interest, and if local authorities were pressed to undertake

Our Illustrations.

GRAND ORIENTAL HOTEL, COLOMBO, CEYLON.

This well-known hotel is now being reconstructed in sections, from the designs of Messrs. Stevens and Gregson and Co., Bombay, Colombo, Rangoon, and 32, Victoria-street, London. The hotel has frontages to three streets—namely, Church-street, York-street, and Princes-street, with a façade totalling 725ft. to these streets. The reception-rooms are of a magnitude and

HOUSE, "HAILEY," OXON.—Mr. FRANK L. PEARSON, F.R.I.B.A., Architect.

give the Board of Agriculture and Fisheries in agricultural districts, and the Local Government Board elsewhere, powers with respect to housing, and to make similar provision for Scotland. He said it was thought advisable at this juncture to pass this Bill as a temporary measure to be applicable only for one year. It was considered that, in case there should be considerable distress from unemployment in this country, it might very likely extend to the building trade, and it would be absurd in such circumstances to expend great sums of public or even private money in giving relief to persons out of work instead of setting the men to work in their own trade to make good the deficiency in housing accommodation which had long been admitted to prevail, both in the town and in the country. While he thought there would be general approval of the principle of the Bill, he desired to make it clear that the Local Government Board did not contemplate setting up a new branch in London, with architects and the necessary staff, for the purpose of letting contracts and itself building houses wherever the need might occur. What he contemplated was to arrange with the public utility societies and local authorities for taking the necessary measures to provide for the deficiency that might exist in their districts. The Board of Agriculture would proceed with plans that had already been made for providing houses in rural districts. Mr. Henry Law said the Opposition thoroughly approved of the course which the right hon. gentleman had taken. The opposition would do all in their power to facilitate the passage of a measure which would give employment when it was needed. Mr. Hayes Fisher asked whether the £4,000,000 to be expended under this Bill would be in addition to the £100,000,000 already voted by Parliament. Mr. Samuel replied that the £4,000,000 would be in addition to the vote of credit. At the same time, it must not be regarded as £4,000,000 devoted to the relief of distress. The £4,000,000 would be spent on the building of houses which at the end of this crisis might result in bringing in revenue, and therefore it was rather in the nature of an investment than a charitable grant.—The Bill was introduced and read a first

building at once, that it might be necessary to consider temporary measures with regard to the rate of interest. The whole operation of the Bill was for one year only, when it would be subject to the review of the House of Commons.—After further debate the Bill was read a second time. The Bill passed through Committee, with amendments, and was read a third time. On the same evening the measure expeditiously passed through all stages in the House of Lords, and after a brief suspension of the sitting received that night the Royal Assent.

IRELAND AND THE HOUSING BILL.—Mr. Birrell, Chief Secretary for Ireland, introduced on Monday a Bill extending the Housing (No. 2) Bill to Ireland, which was read a first time.

The annual meeting of the Cambrian Archaeological Association, which was to take place at Dolgelly next week, has been abandoned.

A Local Government Board inquiry has been held at Newport, Mon., into an application of the Monmouthshire County Council for permission to borrow £2,300 for extending the council offices at Newport, including the provision of furniture. The plans have been prepared by Mr. W. Tanner, the county surveyor.

The annual report on the work of the London County Council during 1913 will be described in four volumes, and the first, now issued, deals with rating, traffic, and public protection. During the year 207 members of the Fire Brigade were injured while on duty, and there were three deaths. The pecuniary loss caused by fires was £357,000, while the latest record shows that the value of property insured was £932,598,000.

The Provisional Order empowering the corporation of Rotherham to construct further tramways has now been confirmed by Parliament. The tramways committee recommend that tramway No. 1 (from Westgate along Market-place, Corporation-street, and Frederick-street to Eflingham-square) be constructed in accordance with the powers obtained, and that application be made to the Board of Trade for sanction to borrow £3,760 10s. to carry out the work.

elegance hitherto unknown in the East, and are situated on the ground and first floors. Upon the upper floors are some 400 bedrooms and bathrooms. The reception-rooms and salons have been decorated with a Renaissance treatment in marble and plaster. The building is a steel-framed structure, with fireproof floors of reinforced concrete, covered with Conolite. The building is faced on its street frontages with Porebunder stone from North-West India and Bombay bluestone. The whole building, when complete, will have cost about £200,000. The contractors for the building are Messrs. Ralph Macdonald and Co., of Colombo.

"HAILEY," IPSDEN, OXON.

This house, which has just been completed from the design and under the superintendence of Mr. Frank L. Pearson, architect, is situated on high ground on the edge of the Chilterns. It is built of Marcham rubble with Clipsham stone dressings, and the roof is covered with Colleyweston slates. Most of the interior fittings are of hard wood. The main staircase is of oak, carved and enriched. The dining and billiard rooms are panelled in oak, and the library in figured Java teak. The gardens are laid out from the designs of the architect to harmonise with the house.

XLIII. GREAT PORTLAND STREET.

The broad, simple treatment of this street façade speaks for itself and calls for little description. It has been carried out in Portland stone. The windows have wrought-iron frames, and the roof is covered with Spanish tiles. The architects are Messrs. William and Edward A. Hunt, F.R.I.B.A., of Donnington House, Norfolk-street, Strand.

RATHBONE CONVALESCENT HOME, PARWICH, DERBYSHIRE.

This building, of which we give a view with plans, has been erected as a con-

FIRST FLOOR PLAN

GROUND FLOOR PLAN

RATHBONE CONVALESCENT HOME, PARWICH, DERBYSHIRE.
Mr. W. R. MOSLEY, Architect.

valescent home for women and children. It is built of local fossil limestone, with stone dressings. The roof is covered with thick Westmoreland slates, with stone ridging. All the opening windows have steel casements and leaded glazing is used throughout. The site on which the Home has been erected is much elevated on a hillside above the village of Parwich, which lies between Ashbourne and Buxton, and commands a grand view of Derbyshire dale scenery, which the principal

rooms face. The design is an adaptation of the style prevalent in Derbyshire country manor-houses of the Jacobean period, and it was desired to avoid the appearance of a public institution, in order to insure a home-like character. The building is planned for the accommodation of twenty-five patients, a matron, nurse, and three domestics; but the funds in hand did not permit of the whole building being completed at once, the east wing being left over, and the scheme will be

finished in due course. The premises are heated throughout by a low-pressure hot-water system, with radiators fixed against the external walls. All the rooms have fireplaces fitted with the patent "Heaped" fire, and all rooms have inlet and extract ventilators. The first floor has been made fire-resisting, and maple floorboards have been laid, same as in the sitting-rooms and bedrooms on ground floor. The dining-hall floor is of maple-wood blocks. The staircases are of Hopton Wood stone, and the corridor on ground floor is paved with Hopton Wood stone laid diagonally. The Home is lighted with the "Litz" safety petrol air-gas. The building contractors are Messrs. Walker and Slater, of Derby. Mr. W. R. Mosley, of Slough, is the architect.

HOUSE, FIELDS PARK, NEWPORT, MON.

Subject to a few modifications, this house has been erected for Mr. A. J. Wilson Jones, of Newport. Owing to a somewhat exposed

COMPETITIONS.

MIDDLETON TOWN HALL.—At the meeting of the Town Council of Middleton, Lanes, on Wednesday in last week, the report and award of Mr. G. Hastwell Grayson, M.A., F.R.I.B.A., of Liverpool, the assessor appointed to advise the council on the relative merits of the designs for the new town hall, were formally adopted and confirmed as follows:—First, premium £100 (merged in commission), No. 39; second, £50, No. 89; third, £25, No. 8. There were 107 sets of plans received. The names of the three successful competitors were made known yesterday. They were: 1, Mr. Alick G. Horsnell, 9, Gray's Inn-square, W.C.; 2, Messrs. Briggs, Wolstenholme, and Thornley, Blackburn; 3, Messrs. Clapham and Symons-Jenne, Norwich House, Southampton-street, Bloomsbury, W.C.

DONCASTER.—Mr. L. P. Abercrombie, of the School of Architecture, Liverpool University, has been invited to act as assessor in the competition for the Doncaster Corporation housing scheme.

Mr. John Stanley Sawdon, deputy borough surveyor of Margate, has been appointed engineer to the St. Anne's-on-the-Sea Urban District Council.

It has been decided to postpone for the present the exhibition of oil-paintings which was to have been opened on September 15 at the Manchester City Art Gallery, and would have remained open during the autumn.

The English Forestry Association state that they will do everything possible to organise supplies of native timber and forest produce from the various districts in the British Isles, and assist collieries and industries where necessary to obtain timber which they require. All communications should be addressed to the Honorary Secretary, Farnham Common, Slough, Bucks.

The agenda at the last meeting of Chesterfield Town Council contained recommendations regarding a series of thirteen street-improvement schemes under the new local Act of Parliament; but, in view of the war, all work entailing the expenditure of large sums was deferred sine die. The acceptance of contracts for a number of private street-improvement works was also indefinitely postponed.

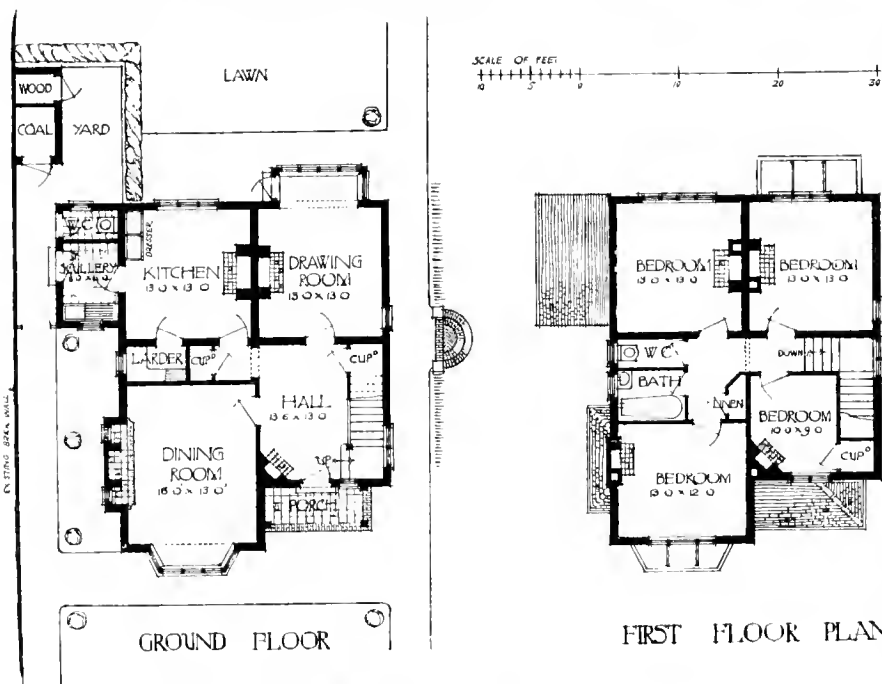

Mr. William Edward Lucas, of Park House, Bexley, Kent, a partner in Messrs. Dann and Lucas, auctioneers and surveyors, of Budge-row, Cannon-street, E.C., who died on June 4, aged fifty-two, left £41,736. He appointed his son to be a partner in the business, and gave to him his share and interest therein. The residue of his estate he bequeathed to his wife and children.

At Cardiff a Local Government Board inquiry has been held by Mr. P. M. Crosthwaite, inspector, respecting an application from the city council for sanction to borrow £50,497 for a new trunk water-service main from Lisvane to the Heath filter-beds, and thence to the city, and for additional filtering appliances and storage facilities. There was no opposition to the application.

On Thursday week, at his residence, 11, Downfield-road, Bristol, Mr. Walter Sturge expired, in his eighty-fourth year. The deceased was a member of the firm of Messrs. J. P. Sturge and Son, land agents and surveyors, Corn-street, Bristol. Mr. William Sturge, who was for some years land steward to the Bristol Corporation, and Mr. Robert Fowler Sturge, present member of the firm, were brothers of the deceased.

A new Constitutional Club, the converted residence of a recently-deceased alderman, was opened at Above Bar, Southampton, on Wednesday week. The work of building a new billiard-room and carrying out the alterations as well as the decoration was entrusted to Mr. H. Cawte, of Church-street, Shirley, from plans and specifications supplied by Mr. A. P. Gutteridge, L.R.I.B.A., of Portland-street, Southampton.

According to a patent by A. P. Percival, Bodawen, Portmadoc, North Wales, and F. E. Matthews, 7, Staple Inn, London, the colour of slates is modified by roasting them, preferably in an oxidising atmosphere, the temperature being gradually raised to about 500-700 deg. C. The roasted slates may be stained with an iron salt solution, or with solutions which react and form precipitates within the pores, the solutions being forced in if necessary. If desired, the slates may be again roasted.

HOUSE AT TWICKENHAM, SURREY.—Mr. STANLEY P. SCASE, Architect.

the dining- and drawing rooms enables these apartments to be combined for special occasions. Externally mixed red brickwork, with cement roughcast coloured cream, were used, wooden casement windows, and roofs of Rosemary tiles in mixed shades. The contractor was Mr. G. Fred Leadbeter, and the architects were Messrs. Alfred Swash and Son, F.R.I.B.A., of Newport.

The roofs are covered with red sandfaced tiles. The square entrance-hall is panelled in oak, with ceiling-beams exposed. The accommodation is shown on the accompanying illustrations. Mr. Stanley P. Scase, of 32, Southdown-road, Wimbledon, S.W., was the architect, and Mr. R. Miller, of Twickenham, was the builder.

ST. MARK'S CHURCH, BUSH HILL PARK, ENFIELD, N.

Owing to the considerable amount of building which has taken place in the neighbourhood during recent years it has been found that the accommodation provided is not sufficient, and for some time the vicar and a committee have been working to secure funds for enlarging the church by the addition of a new aisle, the lengthening of the nave and south aisle, and vestries, etc. The additions will be carried out in local red bricks and stone dressings. The work will probably be started within the next month or two. The architects are Messrs. Cutts Davis, and Boddly, of 11, Southampton-street Strand, W.C.

The urban district council of St. Anne's-on-the-Sea have received the sanction of the Local Government Board to borrow the sums of £28,061 and £1,039 for sewerage works.

At Basingstoke a Local Government Board inspector has held an inquiry into the application of the corporation for sanction to borrow £7,200 for the purchase of land and the erection thereon of working-class dwellings. The plans have been prepared by Mr. F. R. Phipps, the borough surveyor.

The city surveyor, Mr. J. Ashurst, attended the St. Albans City Council meeting on Thursday evening in last week in uniform as lieutenant and transport officer attached to the Eastern Mounted Brigade of Field Ambulance (Territorials) which has been called up. Lieutenant Ashurst, who had been given leave by his colonel to attend the meeting, explained the circumstances. The members formally consented to his abstention from the duties of his municipal office, and decided that his salary should continue less the amount of his military pay. The mayor, on behalf of the council, wished their surveyor every success and good wishes and a safe return.

HOUSE AT TWICKENHAM

This house has been erected in London road, Twickenham, Middlesex, for Mr. J. W. Bennett. The walls up to ground floor sills are built of red sandfaced bricks, and the walls above are stuccoed, finished dead white.

ST. MARK'S CHURCH, BUSH HILL PARK, ENFIELD, N. Messrs. CUTTS, DAVIS, and Bonby, Architects.

Correspondence.

HOW THE R.I.B.A. CAN HELP.

To the Editor of the BUILDING NEWS.

SIR,—The following suggestions have been made to me of ways in which architects could be of assistance at the present time:—

1. By offering their services to the Government, either collectively or individually, in connection with the building, equipment, inspection, and maintenance of temporary barracks, hospitals, etc., or for any other kind of work which they are qualified to perform.

2. By arranging to look after the work of young architects who are already called out, or who contemplate joining the Forces.

3. It has also been suggested that a subscription list be opened to enable architects to contribute as a body to the Prince of Wales's National Relief Fund.

The Institute is proposing to act in conjunction with the Architectural Association, which is already moving in the matter. A meeting will be held at No. 9, Conduit-street, on Friday, August 14, at 4.30 p.m., for the consideration of these and any other suggestions.—I am, etc.,

ERNEST NEWTON, President.

The Royal Institute of British Architects,
No. 9, Conduit-street, Hanover-square,
London, W., August 11, 1914.

FORCE OF ARCHITECTS.

SIR,—At the present time all members of the architectural profession are anxious to know how to serve their country to the best advantage. Many of us are unable to leave our offices altogether as long as building work is in progress, but at the same time are anxious to train ourselves with a view to possible service later on.

With this object in view, the Association is hoping to raise a body of architects who are not at present in any Territorial force or otherwise trained. We shall be glad to receive names of those who would be willing to join us as and when their occupations permit. If the response, as we imagine will be the case, is sufficiently large, definite arrangements for training will be made forthwith and further information supplied.

At present part-time training only is contemplated, but we hope later to be in a position to offer ourselves in a body to the authorities as a trained unit for such service as they may require.—I am, etc.,

MAURICE E. WEBB, President.

The Architectural Association, 18, Tufton-street, S.W.

P.S.—It is not proposed to confine membership to members of the Association, but to include all members of the architectural and allied professions who care to join.

INCONSIDERATE URGENCY.

SIR,—During the war the building trade will be faced by difficulties which may induce many firms to close their works, and so increase unemployment, notwithstanding that they may have plenty of work in hand.

There will be difficulties in getting supplies of material, and trouble with labour, owing to leading hands and particular classes of tradesmen being called away to serve their country. In a time like this it behoves every one of us to act unselfishly in our business and private relations, and so reduce the difficulties which have to be overcome.

During the last few days builders will have been astonished to receive letters from firms with whom they may have dealt for many years, intimating that during this crisis they will give preference to those customers who pay cash with their orders. The letter goes on to say, with delightful irony, that customers will no doubt see the desirability of such proceedings; but, of course, when the war is over, the firm will be pleased to resume their normal business relations.

Such a letter was sent to me by a firm to whom I must have paid hundreds of pounds,

on receipt of an order from me amounting to less than £2.

In another case, a wealthy firm who have been the principal promoters of a ring to control the price of an essential article used in building, have issued a series of circulars to their customers. First of all, they say that in order to keep their hands employed during this time of trouble, they must have cash with all orders. Another circular follows, stating all accounts not paid at date must be paid before further orders can be executed; and another circular is evidently intended to impress these facts on the minds of their customers.

I can imagine nothing more discreditable and likely to do more mischief than this method of restricting business. In these times there are many individuals well-known to their builders who are temporarily short of the means of paying their accounts, and except under special circumstances the average country builder would not think of pressing for his account. Yet his means of continuing his business, and keeping his men employed, are to be hampered by firms who hold the control over the means of supply.

To take my own case, which is representative of the majority of country builders, I shall keep my business going and my hands at work as long as I can get supplies of material, even though I have to pay cash for them.

But, when these troubles are over, I shall not forget the firms who have behaved in such a selfish and unpatriotic manner.—I am, etc.,
A COUNTRY BUILDER.

[We have other letters of a similar nature for which we cannot spare space. The intimations referred to were perhaps sent out last week when some pardonable anxiety existed all round as to the general monetary position. Thanks to the action of the Government, that is at an end now, and there can be no reason for any denial of ordinary credit to any customer.—Ed. B.N.]

"BUSINESS AS USUAL."

SIR,—I believe one of the gravest necessities at the present moment is to keep before the commercial community the very old and commonplace phrase, "Business as usual."

May I take the opportunity of suggesting that if you have a spare inch in your paper, you print as boldly as may be possible—

Britain's Motto:
"Business as Usual."

For my own part, I am going to do my best to prevail upon all our clients to do their advertising as usual, and I think concerted action of this kind will prove beneficial to all of us.—I am, etc.,

H. E. MORGAN.

W. H. Smith and Son, 95, Fetter-lane,
E.C., August 10, 1914.

The Bristol Corporation Tramways Act, authorising the municipal authority to purchase from a limited company and work the local electric tramways, has received the Royal Assent.

The council of the Institution of Municipal Engineers have decided to abandon the week-end visit to Hunstanton which was announced to begin to-morrow (Saturday), also that to the South Metropolitan Gasworks.

The Land Union has issued a notice that all propaganda work is entirely suspended for the present. The union has offered to the State the temporary use of the bulk of its offices and the services of the majority of the staff, free of expense.

The finance committee of the Salford Corporation have drafted an amended schedule of duties for the position of borough engineer, and recommend the town council to invite applicants for the vacant post at a salary of £900 a year, rising to £1,100 per year.

A meeting is to be held in Rhyl to-day (Friday) of the parties interested in the proposed new road from Gronant to Rhyl. There is every likelihood of the road being made, the work to be started at an early date, as the Road Board has definitely promised £6,000 out of the £18,000 required. Urgent action is being taken to find work for unemployed men during the winter.

Intercommunication.

GUINEAS FOR BEST REPLIES.

We offer a prize of one guinea every week for what we deem the best reply to any query appearing in this column, which we deem worth insertion.

Replies must be sent in over real name and address. No others can receive a prize. The Editor's judgment is final.

This competition is restricted to buyers of the paper, and with each reply a coupon cut from our front page must be enclosed.

Any number of replies can be sent, but a coupon of this date must accompany each.

All else being equal, brief replies will stand the best chance. We emphasise this, as some correspondents ignore the fact that querists want terse facts, not long essays. Any necessary illustrations must be in line only—no tints or washes—and about twice the size they are meant to be reproduced. We are unable to avail ourselves of replies that contain illustrations unless we receive them by first post on Tuesdays.

The right to withhold the prize in the event of no reply being received worthy of it is reserved by the Editor, who also claims the right to publish any other replies he may deem useful.

QUESTIONS.

[13147.]—BOX SEXTANT.—Can any of your readers give a few practical hints on the use of the box sextant in surveying angles? Thanking you in anticipation.—P. Scrimton.

WATER SUPPLY AND SANITARY MATTERS.

NEWPORT, MON.—The corporation of Newport, Mon., have under consideration a report by their waterworks engineer, Mr. H. Trembling, on the proposal to construct a reservoir at Henllys. Already the corporation has four reservoirs with a storage capacity of 675,000,000 gallons; but it is now proposed to construct a fifth reservoir to the south-east of Henllys Church. It will have a water area of 33 acres, while its greatest depth will be 60ft., and the top water-level will be 250ft. above Ordnance datum. The total storage capacity will be 290,000,000 gallons. The cost of this reservoir is estimated at £120,000.

SLEAFORD WATER SUPPLIES.—The water schemes before the Sleaford Rural District Council were referred to on Monday in letters from the Local Government Board. That Department declined to consider a loan for the Anwick scheme unless a pumping plant were provided, and with reference to the Ewerby combined scheme they considered that the design of the proposed water-tower was not altogether satisfactory. Suggestions were offered, and the Board asked for a statement showing how the figures of the apportionment were arrived at.

The Provisional Order No. 18 which provides for the amalgamation of the Three Towns—Plymouth, Devonport, and Stonehouse—received the Royal Assent on Monday.

The city council of Sheffield are endeavouring to raise a loan of £3,685 for works of private street improvement in Blast-lane, Cadman-street, Lumley-street, and Edmund-street.

Although in Manchester unemployment is increasing, employment in the building trade in the city is, we are glad to learn, unaffected, and it is good to learn that the construction of several big buildings and a number of houses is to be proceeded with.

At Paignton an inquiry has been held by an inspector from the Local Government Board into an application of the urban district council for permission to borrow £2,537 for an extension of the isolation hospital. Mr. C. O. Barnes, the surveyor to the urban council, has prepared the plans.

Mr. Barton Grainger, jun., eldest son of ex-Alderman Grainger, of West Hartlepool, has been appointed engineer to the Rhyd and Aber Valleys Gas and Water Company. Mr. Grainger received his training under Mr. Thomas Bower, M. Inst. C.E., general manager of the Hartlepool Gas and Water Company, whose chief assistant he has been since 1907.

In order to provide work for men during the coming winter, the urban district council of Rhyl have passed plans for the new amphitheatre, to cost £1,000, and have engaged the surveyor to at once prepare a full scheme of promenade improvement, while the plans for the new pier are to be submitted to a marine expert, so that this work also can be undertaken at an early date.

Our Office Table.

The Council of the Institution of Municipal and County Engineers are equally alert with the R.I.B.A. and the A.A., whose patriotic proposals are referred to on earlier pages of this issue, in outlining suggested services which they could render to the nation in the present crisis. These, now propounded by the President, are in furtherance of the intimation given by a deputation which a few years ago waited upon the War Office. The following are services which are suggested as coming within the power of the members of the Institution. To be prepared to point out suitable camping-grounds and temporary halting-places, having regard to water supply and sewage disposal, and for this purpose to co-operate with the water engineer of the district. It is further suggested that members should be prepared to improvise water supplies and to carry out sanitary measures in connection with camps, etc.; to facilitate transport by having all main roads free from obstacles, and any weak bridges made safe for heavy traffic; to be prepared to guard against possible interference with the supply of water or electricity by spies; to be prepared with suitable employment in case of distress, particularly bearing in mind that labour, and not material, should form the chief part of the work; to offer services gratuitously to adjoining districts from which a colleague has gone to the front; to urge upon employees the duty of acquiring a knowledge of ambulance work, and to give every facility and encouragement to them for so doing.

The Manchester Corporation Bill, which has received the Royal Assent, confers upon the city council powers of street widening, including authority for the removal of Cross-street Chapel, the carrying out of a number of tramway extensions, the construction of a new electricity generating station in Trafford Park, the construction of a new sewer in the Stretford district, the borrowing of £1,000,000 for the purpose of obtaining a further supply of water from Thirlmere by means of a fourth pipe, £300,000 for the extension of mains and other purposes in connection with the supply and distribution of water.

An inquiry into the application of the Sheffield City Council for sanction to borrow an aggregate amount of £19,600 was held at the town-hall in that city on Wednesday week, by Mr. H. Shelford Bidwell, a Local Government Board inspector. The sum is made up as follows: £3,615 for the purchase of property in West-street and Fitzwilliam-street; £6,200 for the purchase of Bowden Housteads Wood, Handsworth; £3,685 for works of private street improvement in Blast-lane, Cadman-street, Lumley-street, and Edmund-street; and £6,100 for laying out a part (comprising fifteen acres) of the Abbey-lane Cemetery. In respect to the first application, the town clerk (Mr. W. E. Hart) explained that the property was required for the purpose of widening West-street and Fitzwilliam-street. The property came into the market, being offered at public auction, and the improvement committee authorised its purchase.—Alderman Marsh said the corporation had of late spent a considerable sum of money in widening West street, and it was important to carry out a further improvement at the junction of Fitzwilliam-street and West-street. Dealing with the Bowden Housteads Wood application, the town clerk said the proposal was to purchase for £6,000 from the Duke of Norfolk about 100 acres of land just outside the city borders for public walks. The inquiry was concluded.

A recent return by the Local Government Board illustrates how evenly public authorities and private enterprise keep together in the provision of houses for the people. Since the passing of the Housing Act of 1909 loans amounting to £1,529,909 have been granted to boroughs and urban district authorities for the erection of 6,508 houses. £319,880 has been advanced for the erection of 1,516 houses—a total of 8,024 dwellings.

On the other hand, £1,497,491 has been lent by the Public Works Loans Commissioners for the construction of 8,783 houses by public utility societies. So that the latter have erected slightly more houses than the local authorities. These figures are for the period from 1910 to July 24 of the present year, and represent only a part of the good work made possible under the Act—for thousands of houses have been put into habitable repair. The fact that last year alone over 6,000 of the houses included in the total were erected is suggestive of the rapidity with which the work is being executed now that the procedure is better understood.

A White Paper has been issued dealing with the cottages and allotments under the Irish Land Act of 1903, as amended by the Labourers (Ireland) Acts, 1906 and 1911. The total number of cottages provided under the Act was 43,702 and allotments 562. Ulster taking 7,590 cottages and 113 allotments, Munster 17,988 and 195, Leinster 15,959 and 231, and Connaught 2,165 and 23. The rents reserved in the lettings were in some cases extremely low. Out of the 43,702 cottages 270 were unoccupied, and the same was true of nine out of 562 allotments. The rent of 17,150 cottages and 204 allotments was in arrear to the amount of £9,218 2s. 5d.

With a view to maintaining as far as possible the aggregate volume of employment, the Development Commissioners desire to do everything within their statutory powers to make immediately available the whole of the funds still unallocated, amounting to nearly a million pounds. They are prepared to deal as quickly as possible with any schemes put before them, and to make recommendations to the Treasury for loans or grants from the Development Fund to public authorities, universities, colleges, schools, or institutions, or associations of persons and companies not trading for profit for the purpose of immediately setting in operation works of improvement falling within the terms of the Statute. So far as the Development Fund itself is concerned the Commissioners are unable within their statutory authority, to deal with any applications for grants or loans to companies trading for profit or to individuals. They invite suggestions, especially with regard to works of improvement connected with agriculture and rural industries (including afforestation), fisheries and fishery harbours, land drainage and reclamation, inland navigations, and light railways. Such suggestions should be addressed to the Secretary to the Development Commission, 6A, Dean's-yard, Westminster. Applications for grants or loans should be addressed to the Secretary to the Treasury, Whitehall.

At a meeting of the Atherstone Board of Guardians, this week, the chairman (Mr. W. G. Phillips) said he was certainly opposed to carrying out the scheme for making extensive alterations at the workhouse at the present moment, because the condition of the country was such as would not warrant them in going to any additional expense under existing circumstances. Without showing any weakness towards the scheme recommended by the Local Government Board, he thought they must devote their energies and means to something more serious and much more urgent at the present time. The vice-chairman (Mr. T. Slack) said the Local Government Board would probably wish the guardians to press forward with the scheme in order to give work to the unemployed. The chairman said he believed there would be quite enough building work to find employment for bricklayers and carpenters for some time to come. The unemployment would arise from manufacturers having to close down owing to the stoppage of export trade. It was decided temporarily to suspend further action with regard to the building scheme. That is not creditable to Atherstone, and we hope the Local Government Board will intervene.

The San Francisco Chapter of the American Institute of Architects have adopted a report on competitions, prepared by a specially appointed sub-committee. The report deals largely with the matter of com-

petitions as participated in by members of the Institute. The closing paragraph is of general interest. It runs: "It is the conclusion of this committee that it is manifestly unfair for certain members of an organisation pledged to support a well-defined attitude towards competitions to participate in unauthorised competitions, while other members show a proper support by their refusal to compete. The Chapter should not be called upon for ever to warn its members of flagrant violation of its mandates."

The fifth report of the Royal Commission appointed to inventory the Ancient and Historical Monuments and Constructions of Wales and Monmouthshire has just been published. The Commissioners state that the inventories of Denbighshire are in the press, and will be issued in the course of the present year. The inspection of the monuments of Carmarthenshire has been completed, and the inventories are in preparation for the Press. The volume on this county will be taken in hand immediately on the publication of that for Denbighshire. The inspection of the antiquities in the county of Merioneth is in progress, and will be concluded this year. Satisfactory progress has been made in the examination of the tithe schedules and maps at the Board of Agriculture and Fisheries. Of this undertaking there remain unfinished only the schedules and maps for the counties of Cardigan, Glamorgan, and Monmouth, and of these the first-named is already in hand. The Commissioners continue to receive occasional reports of damage done to the monuments, as a rule to those of the prehistoric class, and, though without power of active interference in such cases, they endeavour to exert what influence they possess in the best interests of the public.

The Salem, Massachusetts, Rebuilding Commission is organising a housing exhibition and invites contributions from builders, architects, or property owners. Plans, sketches, photographs, or models of proposed or executed dwellings of any sort will be welcomed, as well as any special types of economic building construction. It is particularly desired to illustrate what can be done in the way of fireproof or semi-fireproof construction, with special reference to the needs of tenants who can pay only from 12dol. a month upward. Contributions can be sent to the City Hall, Salem, Mass., care of the City Messenger, and should be marked, "Salem Housing Exhibition." A premium of 500dol. has been offered for the best plan of a 2,500dol. house. Details of the competition can be obtained upon application to Mr. C. H. Blackall, advisory architect, Salem Rebuilding Commission, 20, Beacon-street, Boston, Mass.

MEETINGS FOR THE ENSUING WEEK.

FRIDAY.—Royal Institute of British Architects. Special Meeting to Consider what Assistance can be Rendered to the Government. 9, Conduit-street, W. 4.30 p.m.

At a Local Government Board inquiry at Sheffield into an application by the corporation to borrow £19,832 for sewerage works, it was stated that during the last two years the price of pipes had gone up 50 per cent., labour 10 per cent., and team work 10 per cent.

The council of the Auctioneers' and Estate Agents' Institute of the United Kingdom, after consultation with the local committee, have decided to postpone indefinitely the annual provincial meeting at Newcastle-upon-Tyne, which had been fixed for September 2 to 5.

An abstract account of the Road Improvement Fund for the year ended March 31 last has been issued as a White paper. The receipts amounted to £3,573,552 10s. 2d. Grants for the construction of new roads amounted to £16,950, for the improvement of roads to £622,763, and loans for the improvement of roads to £296,892.

Arising out of an application to the Local Government Board by the rural district council of Watford, for sanction to borrow £11,000 for purposes of sewerage and sewage disposal for the parish of Aldenham, including works in the parish of St. Stephen's, Mr. R. G. Hetherington, M.Inst.C.E., a Local Government Board Inspector, held an inquiry at the Parish Hall, Watling-street, Radlett, on Wednesday week. Mr. W. H. Radford, M.I.C.E., of Nottingham, the engineer of the scheme, explained the plans and proposals.

Trade News.

WAGES MOVEMENTS.

EDINBURGH.—At a special meeting of the Edinburgh and District managing committee of the Amalgamated Society of Carpenters and Joiners held on Monday, the effect of the war on the building trades in the district was under consideration. In their desire to give every assistance possible in making provision for the care and treatment of the sick and wounded, they have decided to recommend the suspension meantime of the rule restricting overtime to twelve hours per man per week on such work as had been rendered necessary by the war, and which was being done under emergency orders from the naval and military authorities.

GOVERNMENT CARPENTERS' WAGES RAISED.—Carpenters in the Government factories at Enfield and Waltham Abbey have had their wages increased by 3s. 6d. per week, starting from April 1, making 43s. for a 48-hour week.

LIVERPOOL.—The appeal of the Lord Mayor of Liverpool to employers to maintain employment at its normal state has already met with a generous response. A stimulating lead has been given by the local Building Material Trades Association and the Plumbers' Merchants' Association, the members of which conduct their business in Liverpool, Birkenhead, and Wallasey. Employers in all sections of this important industry are urged to exert every effort to keep their men at work at full time as far as possible, and it is pointed out that by this means they will be contributing to the welfare of the working classes, and through them to the national interest. In order that this can be done, it is clear that all buildings in course of erection should be continued, and contemplated buildings be put in hand immediately; while the patriotic endeavours of the merchants also imposes on builders and public and private bodies the obligation to continue financial relations strictly in accordance with the usual credit terms of the trade.

Mr. Frank Jenkins, builder, of Cheltenham, died on Saturday last in the Cheltenham hospital after an operation for an internal complaint.

Lord Emmott, G.C.M.G., was on Friday sworn in as First Commissioner of Works in succession to Earl Beauchamp, now President of the Council.

Mr. Thomas Adams, who has been the head of the Town Planning Department of the Local Government Board since its establishment, is retiring in October, and will be succeeded by Mr. G. L. Pepler.

Mr. Morgan Bransby Williams, of Killay House, Killay, Swansea, chairman of the Rhondda and Swansea and Bay Railway Company, and formerly engaged in railway constructional work, who died on June 21, left £54,633.

In view of the war, and of the need for economy, the execution of the Guildhall improvement scheme, from the designs of Mr. E. Sydney Perks, city surveyor, recently adopted by the City of London Corporation, has been postponed.

Mr. C. H. Collins Baker has been appointed Keeper of the National Gallery in succession to Mr. Hawes Turner, who resigned some time ago. Mr. Baker has written many works on English art, including two volumes dealing with "Lely and the Stuart Portrait Painters."

The town council of Stourport have decided to serve the corporation of Kidderminster with statutory objections to the carrying out of certain sewage works at the corporation farm. This will enable the council to be heard when a public inquiry is held relative to the proposed loan to Kidderminster Council of £13,500 for carrying out the work.

The death of Mr. A. W. Blackburn, builder and contractor, of 35, Cannon street, E.C., occurred at his residence, Tewhurst, Furze-hill, Purley, near Croydon, on Thursday, the 6th inst. Mr. Blackburn, who was in his 57th year, succeeded to the old-established business of W. Hawtrey and Son. Deceased was a Liveryman of the Wax Chandlers' Company. The funeral took place at London-road Cemetery, Bromley, Kent, on Monday afternoon.

The rules have just been published of the newly-organised National Illumination Committee of Great Britain. This committee, which is affiliated to the International Commission on Illumination, and is constituted by co-operation of the Illuminating Engineering Society, the Institute of Electrical Engineers, the Institution of Gas Engineers, and the National Physical Laboratory. The secretary and treasurer is Mr. W. J. A. Butterfield, 66, Victoria-street, S.W.

LATEST PRICES.

IRON.

Table of iron prices including Steel Joists, Wrought-Iron Girder Plates, Steel Girder Plates, Bar Iron, good Flats, Do., Lowmoor, Flat, Round, or Square, Do., Welsh, Boiler Plates, Iron—South Staffs, Best Sreeshill, Angles 10s., Tees 20s. per ton extra, Builders' Hoop Iron, Ditto galvanised, Galvanised Corrugated Sheet Iron, Cast-Iron Columns, Cast-Iron Stanchions, Rolled-Iron Fencing Wire, Rolled-Steel Fencing Wire, Galvanised Cast-Iron Sash Weights, Cut Floor Brads, Corrugated Iron, Galvanised Wire Strand, B.B. Drawn Telegraph Wire, Galvanised Cast-Iron Socket Pipes, Pig Iron, Cold Blast, Lillieshall, Hot Blast, Wrought-Iron Tubes and Fittings, Standard Lists f.o.b., Gas-Tubes, Water-Tubes, Steam-Tubes, Galvanised Gas-Tubes, Galvanised Water-Tubes, Galvanised Steam-Tubes.

OTHER METALS.

Table of other metal prices including Spelter, Silesian, Lead Water Pipe, Lead Barrel Pipe, Lead Pipe, Tinned inside, Lead Pipe, Tinned inside and outside, Composition Gas-Pipe, Lead Soil-pipe, Lead, Common Brands, Lead Shot, Copper Sheets, sheathing & rods, Copper, British Cake and Ingot, Tin, English Ingots, Do., Bars, Pig Lead, in 1cwt. Pigs (Town), Sheet Lead, Genuine White Lead, Refined Red Lead, Sheet Zinc, Old Lead, against account, Tin, Cut nails (per cwt. basis, ordinary brand).

TIMBER.

CONSTRUCTIONAL.

Table of timber prices including Yellow Pine Deals, Spruce Deals, Red Deals, White Deals, Flooring, Pitch Pine, Lignum Vitae, Yellow Pine Logs, Birch, Oak, Mahogany.

FURNITURE AND HARDWOODS.

Table of furniture and hardwood prices including Teak, Oak Planks, Boards, Sequoia, Birch, Oak, Walnut, Mahogany, Satinwood, Rosewood, Lignum Vitae.

STONE.

Table of stone prices including Red Mansfield, Darley Dale, Red Corsehill, Closeburn Red Freestone, Ancaster, Greenhill, Chilmark, Hard York, Do. do. 6in. sawn both sides, Do. do. 3in. slab sawn two sides.

* All F.O.R. London.

Table of stone prices including Bath Stone, Portland Stone, Pimlico Wharf.

SLATES.

Table of slate prices including Blue Portmadoc, Blue Bangor, First quality, Eureka uufading, Permanent Green.

BRICKS.

(All prices net.)

Table of brick prices including First Hard Stocks, Second Hard Stocks, Mild Stocks, Picked Stocks for Facings, Flettons, Pressed Wire Cuts, Red Wire Cuts, Best Fareham Red, Best Red Pressed, Ruabon Facing, Best Blue Pressed, Staffordshire, Ditto Bullnose, Best Stourbridge, Firebricks, 2 1/2 in. Best Red Ac-cington Plastic Facing Bricks, 3 1/2 in. Accrington Best Red Plastic Facing per 1,000, 3 1/2 in. ditto Second Best Plastic ditto, Ditto Ordinary Secondary Bricks, Ditto Plastic Engineering Bricks, Sewer Arch Brick, 3 1/2 in. Chimney Bricks, 3 1/2 in. ditto through and through, 3 1/2 in. Beaded, Ovolo and Bevel Jamb; Octagons, 2 1/2 and 3/4 radius Bullnoses, Stock patterns, Accrington Air Bricks, Ditto, Accrington Camber Arches, 3 course deep, 4 1/2 in. ditto, 4 1/2 in. ditto ditto ditto, 5 ditto, 6 ditto, 3 ditto, 4 ditto, 5 ditto, 6 ditto.

Net free on rail, or free on boat at works.

GLAZED BRICKS.

Table with columns for Glazed Bricks, Hard Glazes (per 1,000), and various brick types like Stretchers, Headers, and Double Headers.

MOULDED BRICKS.

Table with columns for Moulded Bricks, Stretchers and Headers, and various brick types like Internal and External Angles.

Best Portland Cement... 36 0 to 4 0 delivered... Ground Blue Lias Lime... 21 0 per ton delivered...

TILES.

Table with columns for Tiles, Plain red roofing tiles, Hip and Valley tiles, Ornamental tiles, etc.

OILS.

Table with columns for Oils, Rapeseed, English pale, per ton, Ditto, brown, Cottonseed, refined, etc.

GLASS (IN CRATES).

Table with columns for Glass (in crates), English Sheet Glass, 15oz., 21oz., 26oz., 32oz., etc.

VARNISHES, &c.

Table with columns for Varnishes, Fine Pale Oak Varnish, Pals Copal Oak, Superfine Pale Elastic Oak, etc.

TRADE NOTES.

Under the direction of Messrs. Bateman and Bateman, architects, Birmingham, Boyle's latest patent "Air-pump" ventilator has been applied to Northfield Library.

At Messrs. Catesby's, Ltd., all positions will be kept open; all national insurance premiums will be paid until further notice; special treatment for credit customers, especially where husbands have joined the Imperial forces.

Messrs. Waygood-Otis, Ltd., state that they consider it the duty of all business houses to proceed, as far as possible, as though war did not now exist. This they are doing, and are prepared to give best prices and delivery as heretofore.

The stopping of Continental competition is resulting in further advances in Midland iron prices. A meeting of gas-strip manufacturers was held at Birmingham on Monday, when it was resolved to raise prices £1 a ton, owing to the higher cost and the difficulty of obtaining raw material.

The directors of Claridge's Patent Asphalt Co., Ltd., announce that they are paying to the wives of all men in their employ who are serving the country in any branch of H.M. Service the difference between their pay as combatants and their average weekly wages, in addition to keeping their positions open for the men on their return from service.

CHIPS.

The town council of Grantham have increased the salary of the borough surveyor by £25 per annum.

The Hull city council have agreed, in consequence of the war, to hold over the £100,000 housing scheme on which the Health Committee submitted a report.

The funeral took place at Cranbrook on Thursday in last week of Mr. Charles Poole, formerly surveyor to the old Cranbrook Highway Board, who died on August 1st at the age of 83.

Mr. Frank B. Dunkerley, of St. Ann's-square, Manchester, President of the Manchester Society of Architects, writes: "Any man who has the courage to build now, if only a pair of cottages, will be doing a patriotic action."

A Local Government Board inquiry has been held at Mountain Ash into an application of the urban district council for sanction to a loan of £40,000 for water supply works.

The Development Commissioners suggest to landowners in England and Wales that they should at once forward to the Agricultural College for their province particulars of any waste land which they are willing to place at the disposal of suitable authorities for improvement by such means as reclamation or afforestation.

Experimental sections of concrete roads are to be laid down on the Strood-road, near Gravesend. Four isolated lengths of 75 yards of the road will be taken up and relaid by concrete. The British Portland Cement Company will supply the material free of cost, and of the remaining expenditure, estimated at £500, one-third will be borne by the Kent County Council, and another third by the Road Board, the remainder being locally provided.

FOR

Olivers' Seasoned Hardwoods,

TO-

WM. OLIVER & SONS, Ltd., 120 Bunhill Row London, E.C.

TENDERS.

** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender; it adds to the value of the information.

An elementary school is in course of erection in Clarkson-street, Canning Town, from plans by Mr. W. Jacques, A.R.I.B.A., Fen-court, Fen-church-street, E.C.

Works of sewerage are about to be carried out in the village of Thurlwood for the Congleton Rural District Council. Mr. Wyatt is the engineer, and the estimated outlay is £2,150.

The rural district council of Llanfyllin have instructed Messrs. Berrington, Son, and Watney, of Wolverhampton and Westminster, to prepare a sewerage and sewage disposal scheme for Llanfair Caereinion.

Alterations and additions have just been executed at Congham Lodge, Norfolk, for Sir Everard Ffolkes, Bart., entailing an outlay of about £4,000. Mr. Herbert J. Green, of Norwich, was the architect, and the builders were Messrs. Dye and Allen, of King's Lynn.

There have been voted by the State Legislature of California 3,000,000dol. for the Capitol extension plan; 1,800,000dol. for University of California buildings; 1,260,000dol. for State buildings in Los Angeles; 1,000,000dol. for State buildings in San Francisco; and 700,000dol. for the enlargement of the State Fair.

A reinforced concrete poutoon landing stage has recently been put into use in the harbour of Sydney, Australia. The poutoon, which takes a live load of 150 tons, is 100ft. long, 43ft. wide at one end and 68ft. at the other, 7ft. 9in. deep, with a 32in. freeboard. The bottom is flat, and the sides and ends are sloped to an angle of 50deg. The poutoon, which weighed 650 tons, is divided into 48 water-tight compartments by solid reinforced concrete walls.

TO CORRESPONDENTS.

We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.

It is particularly requested that all drawings and all communications respecting illustrations or literary matter, books for review, etc., should be addressed to the EDITOR of the BUILDING NEWS, Effingham House, 1, Arundel-street, Strand, W.C., and not to members of the staff by name. Delay is not infrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

When favouring us with drawings or photographs, architects are asked kindly to state how long the building has been erected. It does neither them nor us much good to illustrate buildings which have become some time executed, except under special circumstances.

* Drawings of selected competition designs, important public and private buildings, details of old and new work, and good sketches are always welcome, and for such no charge is made for insertion. Of more commonplace subjects—small churches, chapels, houses, etc.—we have usually far more sent than we can insert, but are glad to do so when space permits, on mutually advantageous terms, which may be ascertained on application.

NOTICE.

Bound copies of Vol. CVI. are now ready, and should be ordered early (price 12s. each, by post 12s. 9d.), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XLI., XLVI., XLIX., LIII., LXI., LXII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXXI., LXXII., LXXIII., LXXIV., LXXV., LXXVI., LXXVII., LXXVIII., LXXX., LXXXI., LXXXII., LXXXIII., LXXXIV., LXXXV., LXXXVI., LXXXVII., LXXXVIII., LXXXIX., XC., XCI., XCII., XCIII., XCIV., XCV., XCVI., XCVII., XCVIII., XCIX., C., CI., CII., CIII., CIV., CV., and CVI. may still be obtained at the same price; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Handsome Cloth Cases for binding the BUILDING NEWS, price 2s., post free 2s. 4d., can be obtained from any Newsgator, or from the Publisher, Effingham House, 1, Arundel-street, Strand, W.C.

Telephone: Gerrard 1291.
Telegrams: "Timeserver, Estrand, London."

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 6s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation Advertisements) is 6d. per line of Eight Words (the first line counting as two), the minimum charge being 4s. 6d. for 50 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

SITUATIONS VACANT AND PARTNERSHIPS.

The charge for advertisements for "Situations Vacant" and "Partnerships" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

SITUATIONS WANTED.

Advertisements not exceeding Thirty Words, inclusive of name and address, are inserted under the heading "Situations Wanted," free of charge.

Rates for Trade Advertisements on front page, and special and other positions, can be obtained on application to the Publisher.

* Replies to advertisements can be received at the Office, Effingham House, 1, Arundel-street, Strand, W.C., free of charge. If to be forwarded under cover to advertiser, an extra charge of Sixpence is made. (See Notice at head of "Situations.")

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations or stop orders for serial advertisements must reach the office by Tuesday morning to secure attention.

RECEIVED.—P. and Co.—V. de T. A. Co., Ltd.—R. I. F. and Co., Ltd.—W. C. Co., Ltd.—H. R. D. F.—S. E. Co., Ltd.—N. B. and Son.—E. W. and Son.—C. A. Co., Ltd.—H. B. and E. Ltd.—R. M. and Co., Ltd.—L. and Co., Ltd.—S. A. S.—D. and Co., Ltd.—W. W. A.—H. and G.

A.—Yes.
R. G.—Not just now.
V. W.—Thanks; please send.

G. H. L.—We fear not; but really we think some people are needlessly nervous just now, and that some of those who disappait will not forget it by-and-by.

ORIGINAL.—The Royal Academy has been still supporting; but for twelve consecutive years in 1799 at cost King George III. some £1,000,000 in all out of his private purse to make a grand old gallery.

W. T. H. M.—We could only read your query, which is translated by the drawing sent with it, and the diagram section certainly led us to look that you proposed relining of a wood-lined with a stone lining, which to make the churning complete, a rounded face to the stone was intended. If you had had your stone lined will not carry, put an ordinary, retaining arch over the same.

A new Series of Ideal Boilers.

A new Series of Ideal Sectional Boilers is now being made at our Hull Works—the No. 1 "G" Series for Water and the No. 2 "G" Series for Water and Steam.

IDEAL & IDEAL
RADIATORS BOILERS

The special Advantages of the "Ideal" "G" Series Boilers are:
No loose base—therefore no leakage of air between sections and ashpit.

Occupy less space than other Boilers of equal capacity.

Low height of flow tapping.

Ample steam capacity in steam Boilers.

Patent Insulating Jacket covering all exposed surfaces and fixed in a few minutes.

Illustrated pamphlet and price list gratis on receipt of Professional or Trade card.

We supply all Accessories required by the Heating Engineer—Valves, Pipe Fittings, Tools, Registers, Ventilators, etc.

Ideal No. 1 "G" Series Water Boiler with Insulating Jacket.

NATIONAL RADIATOR COMPANY 439 & 441, Oxford Street, London, W.
LIMITED. Works: HULL, Yorks. Telephone Nos.: Mayfair 2153 & 2154.

Agents carrying Stocks of
Ideal Boilers and Ideal Radiators.

A MODERN SUBURB.

We still call it "the village," especially those of us who are old inhabitants of some fifteen or twenty years. We cling to the idea that it is even now in the country. The words "Village Smithy" cut into brick over an ironmonger's shop strengthen the tradition. There is also what was once a village green, though now laid out with iron railings and tar-paved ways across, mostly given up to cats and naughty boys. Yet we talk of going to "London," though it is only some twenty minutes' railway ride, or forty by the ubiquitous electric tram. The older residents, who bought their houses, "freehold," as they tell you, thought they were settling in the country. So they left town, which then seemed far away. Now the town has come to them, and the glory of the countryside has departed. But what would you? This is an age of progress and building, and the people—even the upper and lower middle-class people—must be housed. So, although we do not at all admit being a part of Greater London, we are nearing the day when we shall be absorbed in what may be called Greatest London.

The prevailing opinion in the suburb is, that it is all the fault of wicked builders. Old inhabitants point to a row of red brick houses, and tell you that once—some few years ago—fine trees flourished there. A famous country lane, which is now but a green memory to our aged ones, has become a main tar-paved road, down which the awful red motor-buses run roaring their way, tearing up the surface, and adding heavily to our local rates. Fields that once existed and shimmered in the sunshine of their day are now covered with desirable semi-detached villas, all alike, and with equal gardens of the same length to an inch. Their only difference is to be found in the weird and wonderful names written on the fanlight. Fortunately, as the place grew, our local authority insisted on adding numbers, and this, though opposed as too towny, is admittedly convenient. Some owners, who spent a week in Wales, or had a relative in the Indian Army, have stuck up Welsh unpronounceable villages or Hindoo districts, as the titles of their castles. But the shops stick to the numbers, and leave the rest severely alone. The mysterious way in which our modern suburb grew to its present proud position out of the old village puzzles many people. It takes a builder to know when a plot of ground is "ripe," in the trade term, for development. The land seems to have ripened in rather a patchy manner. Site development and house-planning were not

known in those days. So some wicked speculative builder came along, bought, or got an agreement over, a likely bit of ground, and set to work to sow ground-rents in its soil which soon showed a crop of family residences. In this way the fields were eaten up, and the gardens to our old houses disappeared, after the houses themselves had been pulled down and sold to the knacker. Aged inhabitants tell the sad story to this day, as seriously as they would speak about the slow crumbling of an empire.

The natives are rather proud of the Domestic Architecture to be seen in our roads, though newcomers sometimes say that it may be Domestic, but it is not Architecture. To those who know that the basis of all building is ready money, the financial troubles of a generation of builders can be seen in the houses erected. Where a road stops short suddenly, and has not gone on again, it is obvious that the builder's money ran out, or the financier failed, and no one else has had the heart to go on with the broken job. In other places a road is found to have been well begun with good and large houses, for a certain distance. Then lower down we come upon a far inferior class of property. Here it may be that the original builder bolted, as they have been known to do: sometimes because they see disaster at the end, and no hope of a good bonus. Then the unlucky landowner had to get in another builder, and sought to save himself by putting up cheaper dwellings at much the same rents. But those who bought the first lot are always explaining why their road falls away so sadly in style lower down. In other parts of our suburbs the mark of the mortgagee is very plainly visible. It is, indeed, indelibly written upon the very fronts of the house, so that all who run may read. Dwellings meant to be let at £50 a year with their £10 ground-rent, which is, at all events, a certainty, have come down in the world, and are now fetching, say, £35, or even £30. This reduction of rent is somehow made manifest in the appearance of the dwellings themselves. Why has this happened? The usual history is that the builder could not sell, nor could he go on any longer paying the heavy ground-rent and mortgage interest. So the mortgagees took possession, and had to let the places for what they could get. Then do rents go down, and as mortgagees in possession of unsaleable property do not spend too much on repairs, the premises are apt to look neglected, if not dilapidated. So we who know from experience can often see the mark of the mortgagee as plainly as if

the fact and figures were crudely chalked upon the walls.

The best parts of our suburb look upon and lead off our Common. "The finest in England, sir!" according to the natives. Such avenues of trees. Ornamental water-pond, modernised by L.C.C., with horse-ride, swimming-bath, keepers, etc., all quite complete and up to date. The roads here were laid out more or less upon one coherent plan, and the architecture can really be so described. Detached and semi-detached villa residences: £75 to £125 were the original rents, though somewhat fallen in these degenerate days. Still, there they are, good houses, much varied, large gardens, shrubs, ivy, and green creepers everywhere—comfortable, yet pretty. One amazing thing is to find how many of them were built by the builder for his own occupation! This legend is still repeated by the proud purchasers of years ago, as proof of the sound way in which they were built and finished by the builder for himself to live and die in? Strange! for the same builder must have meant to live and die in so many of them that one's faith falters in working out the problem.

Then there is quite another class of property, more recently erected. This was on the site of our largest and oldest house with lawns, real gardens, and a paddock, and which looked like a country mansion. The owner came to grief, and sold the whole freehold land to one of those wicked speculative builders who once flourished in these parts. The puzzle of the new proprietor was to see how many ground-rents, of £5 each he could plant on so many feet super., after allowing for the necessary roads. Well, of course, the roads had to come first, then the remaining land was plotted out with much ingenuity. Red brick buildings grew up rapidly, based upon ground-rents, and the legal spaces were left behind the back addition. But something had to go, and, of course, it was the gardens, which our agents admit are small, but call "nice" and "pretty." In fact, there is about room for a central rose-tree and a dozen geraniums and a dustbin. The up-to-date builder does not let his houses: he sells them. So all these were for sale, and for sale only; and sold they were sure enough, and since sold again.

One advantage of this method is that the young man just getting married who buys a house of this kind, for which no rent is quoted, can get no figure on which to compare with other houses. So he pays the price asked; or, rather, he agrees to pay it to a Building Society during the coming twelve years or so. It is really the hire-

purchase system extended from furniture to dwellings, and is about as costly and extravagant in the end. But what would you? Builders must build and sell, and the middle classes must be housed in a modern suburb which clings to the country, and yet is an easy train or tram ride to the City. Thus, all parties are happy, and the world goes on! Yet architecture has not much to do with our newer classes of dwelling. The builder has his own well-tried plans and quantities; he knows his brickwork and his wooden stuff to an inch. So the houses go up and sell, and are pretty. All the rest is a matter of finance and figures, which are known only to him and his building owner and mortgagee, and, perhaps, later on, to his creditors. And of such are most modern suburbs that are covering up the country round the central life of London.

MIDDLETON TOWN-HALL COMPETITION.

In this competition, which was decided last week, as reported in our issue of last Friday, the corporation adopted the proper course of appointing the assessor, Mr. Hastwell Grayson, M.A., F.R.I.B.A., at the commencement, and allowing him to draw up the conditions, instead of, as is often the case, delaying his appointment until after the designs were received. The result has been a clear and simple set of conditions, in which only essential facts are stated, with a refreshing absence of the host of unimportant details and verbose legal phraseology with which some town-clerks appear to delight in obscuring the instructions they draw up. The vexed question, whether or not the promoters should definitely bind themselves to carry out the design placed first by the assessor, is dealt with in the following clause:—

It is the intention of the corporation to accept the award of the Assessor, and to entrust the carrying out of the work to the author of the design which the assessor may select, unless, in the opinion of the corporation, with the acquiescence of the assessor after consultation with him, there are imperative reasons to the contrary.

In this way the interests of the profession are safeguarded, while the corporation are not likely to have to entrust an important undertaking to an architect who, though able to submit the best design, might be in other ways obviously unsuitable to carry out the work. Premiums of £100, £50, and £25 were offered for the designs placed first, second, and third respectively, the author of the selected one to receive a further £100 should he not have instructions to proceed with the work within twelve months of the date of the assessor's award.

The drawings required were plans of each floor, three elevations and one section, to a scale of 1/6th. to lin., together with a perspective view. The maximum amount to be expended was £18,000, which included all fees, and £1,000 for furniture. The schedule of accommodation required comprised the following: Telephone exchange and porter's room, waiting-room, town clerk's general and private offices, treasurer's general and private offices, medical officer's general and private offices, health inspector's general and private offices, sanitary stores, education secretary's general and private offices, school attendance office and storerooms, surveyor's drawing office, private office, and plan-room. All the above were to be situated on the ground-floor. One committee-room could be either on the ground floor or on the first floor, as might be found most convenient, while the following were to be provided on the first floor: Council-chamber, mayor's parlour, serving room, two committee rooms, and an assembly hall about 64ft. by 38ft., with platform, crush hall, and gallery. This assembly hall

was to be arranged so that it could be let off separately, if desired, for concerts, etc. In addition to the above, there were to be the usual store-rooms, lavatories, heating-chamber, etc.

Middleton is an interesting little town, possessing a number of both old and new buildings of considerable merit, and the site is situated in a conspicuous position in one of the main streets. On the whole, the competition was a decidedly attractive one, and it was not surprising to find that as many as 107 designs were submitted. Out of these the assessor selected eight for further consideration, his final award being: First, Mr. Alick G. Horsnell, 5, Gray's Inn-square, London; Second Messrs. Briggs, Wolstenholme, and Thornely, Blackburn; Third, Messrs. Clapham and Symons-Jeune, London. The authors of the remaining five designs were: Messrs. Wallis and Bowden, London; Messrs. Honeyman and Keppie, Glasgow; Messrs. H. Townshend, Morgan, and Chas. Cowles-Voysey, London; Messrs. Cleland and Hayward, Wolverhampton; and Messrs. L. S. Sullivan and L. W. Bucknell, London.

DESIGN PLACED FIRST.

As only the eight designs mentioned above were exhibited, it is impossible to comment on the competition as a whole; but it may be unhesitatingly stated that Mr. Horsnell's design is easily the best of the eight. The plan is exceedingly simple and direct, the corridors are short, and the lighting throughout is excellent. The entrance hall is, perhaps, rather lavish for a building of this size; but the plan generally is so compactly arranged that a little extravagance here is permissible. The various departments on the ground-floor are conveniently arranged, while on the first floor, which comprises the council suite and committee rooms, the plan is equally satisfactory. The serving-room, with lift from basement kitchen, hardly fulfils the requirement that it should adjoin the mayor's parlour; but this could be overcome by a slight rearrangement of the rooms when preparing the working drawings. Externally, also, this is quite the best of the premiated designs, the elevations being to a good scale and treated on broad and simple lines. The main front, with the centre portion of stone flanked by plain masses of brickwork, forms a dignified composition and is well illustrated by an excellent wash drawing.

DESIGN PLACED SECOND.

This plan, although very similar in its general lines to the selected one, differs from it in that it has not been built right up to the limits of the site on each side. This has necessarily restricted the size of the central area, with the result that the lighting and ventilation of the corridor and rooms around the area, would not be so perfect as in the selected scheme. The planning of the basement is also not so good, but the arrangement of the council suite on the first floor is excellent. The elevations are interesting and well proportioned, and the drawings include a bold and effective perspective.

DESIGN PLACED THIRD.

This plan also has rather a small central area, with its consequent disadvantages. The scheme is on different lines to the other premiated ones, the assembly-hall being in the front of the building, with the council-chamber in a corner at the rear. The main staircase is badly placed, both in relation to the principal entrance and to the council-chamber, and the plan as a whole lacks the simplicity and balance of the other two. The upper portion of the main facade is really an admirable composition; but it is a pity that the fenestra-

tion on the ground-floor could not have been worked in more happily with that on the floor above.

THE R.I.B.A. AND THE WAR.

A special meeting (open to the whole profession) was held at the Institute on Friday, August 14, 1914, at 4.30 p.m., to consider the best way in which architects can offer their services in the present crisis. The President, Mr. Ernest Newton, A.R.A., was in the chair.

The President, in opening the meeting, said: The specific services to be suggested under No. 1 of the circular which you have received are intended as indications only. There are, of course, many others, which we as architects can offer, apart from those which we can give as citizens. We can, for instance, offer assistance in regard to the proposed housing and other schemes. It has also been suggested that, subject to the approval of the Council, we might offer our ground-floor galleries. The Architectural Association has already a good deal of information as to other work which we might do, and I will presently ask the President, Mr. Maurice Webb, to give you an outline of what they are doing. With regard to No. 2, no explanation is necessary. Many young architects have left their work, with nobody to look after it in their absence, and we must, of course, help them. I shall, presently, ask Sir Aston Webb to move No. 3, and I will, therefore, not anticipate him in saying anything about the proposal, except that I shall ask the Council to send a donation from the Institute. (Hear, hear.) I have not yet had an opportunity of learning if the Architects' Benevolent Society has adequate funds at its disposal, and whether an appeal for subscriptions should be made. It will be necessary, in order to carry out these proposals, to appoint a representative committee, which should have power to add to its numbers, and to form organising committees to deal with different branches of the work. I propose to call a meeting of this committee next Tuesday. I think it will simplify matters if we have formal resolutions covering suggestions 1, 2, and 3, and the appointment of this committee, and it will also save time if any gentleman who has suggestions to make will make them briefly now, and then send them at once, in writing, to the Secretary of the Institute, in order that they may be considered by the committee. I will ask Mr. Maurice Webb to give the meeting an outline of the valuable work which the Architectural Association has already done, and I shall then ask Mr. Hubbard formally to move the first resolution.

Mr. Maurice Webb: I should like, first, on behalf of the Association, to say that we are only anxious to help and assist the Institute as far as we possibly can in any proposals it may bring forward. As regards the actual work which we are doing at the moment, we are endeavouring to get into touch with all men who feel they would like to do something to help at the present time: men who can only give up part of their time, and also men who have tried to join the Territorial forces, but owing to the fullness of their ranks have not been able to get in at present. But we are not able to do anything, and we do not wish to do anything, which will interfere with the regular recruiting, either for the Army or for the Territorial forces later on. For this purpose we propose to affiliate ourselves with a central organisation, called the London Volunteer Defence Force, which, I understand, expects shortly to obtain Government recognition. Lord Desborough is the chairman, and it is supported by a very influential committee. Their scheme is to start training centres all over London, and we shall form one of those centres for men who can only give up part of their time, having drills and musketry practice every night, and at other times as may be arranged. For men who can give their whole time I hope we shall provide a fuller and better system, and that we shall

be able finally to supply a complete company of men who are willing to give up their whole services and affiliate themselves with the Artists' Rifles or with some Engineering Territorial battalion, as soon as we are allowed to go on. But at the present time there is no further recruiting for the Territorials, I understand. For the part-time men we shall have to go on until things develop a little more. At present we have the names of 250 men who are willing to do something, and more are daily coming in. We have rifle ranges at our disposal, a drill-hall and drilling grounds, and we have our own cricket ground at Elstree, which, later, we shall be able to use for week-end camps. As far as the Association goes, I think that is the best side of the work for us to tackle. All men over 30 and up to 45 are eligible, and I hope that later the younger men will be; but at present we cannot drill them if they are eligible for Lord Kitchener's Second Army. In addition, we are endeavouring to help the British Fire-Prevention Committee, for men who are less martial-spirited and who would like to join an Emergency Fire Force, and who are versed in fire work and dangerous structure work, for either part time or whole time. I cannot say anything further, except that our Secretary is here, and he has full particulars of what we are doing, and will be pleased to take the names of any who are willing to help us. (Applause.)

The President: I will now ask Mr. Hubbard formally to move the first resolution.

Mr. Hubbard: The resolution which has been entrusted to me is as follows: "That this representative meeting of the architectural profession offers its services to the Government in whatever capacity they can be most useful at the present time. Also that, subject to the consent of the Council, the R.I.B.A. offers to the Government the use of the Institute's ground-floor galleries, and that an intimation giving effect to these offers be forwarded to the proper quarters." I beg, Sir, to formally move that resolution.

The resolution was put and carried unanimously.

Mr. J. Alfred Gotch: I have much pleasure in proposing the second resolution: "That the architects who are in a position to assist young architects who are already embodied in, or who contemplate joining, the Forces, be asked to send their names to the Secretary of the Institute, and state what they are prepared to do." I do not propose to say anything in support of this, because it is so obvious. My view is that, as far as possible, everyone should endeavour to keep things in their normal state. If young architects have gone to join the Colours and left their business, we ought to depart so far from the normal as to help them as far as we can.

Mr. E. Guy Dawber having seconded, the resolution was put to the meeting and carried unanimously.

The President: I will now ask Sir Aston Webb to move Resolution No. 3.

Sir Aston Webb, R.A.: The resolution I have to propose reads: "That a subscription list be opened to enable architects to contribute as a body to the Prince of Wales's National Relief Fund." I hope the Institute will give a contribution, as from the Institute.

Mr. Lancheater: I will second the resolution. I understand that it says "Architects," not necessarily members of the Institute?

Sir Aston Webb: Architects; yes, certainly.

The President: I think Sir Aston Webb has made it quite clear. The idea is that a subscription list should be opened, so that architects may contribute as a body, more or less, and the Institute will be asked to give a donation too. It answers two purposes: one is to have as large a sum as possible given to the Prince of Wales's Fund—a large sum, we hope; and the other is to enable people who feel they can only give a modest sum to give it in this way rather than sending it direct.

The resolution having been put, was carried unanimously.

The President: The next resolution I was

intending to propose myself. I move "That a committee be appointed to deal with the matters connected with the foregoing resolutions, this committee to have power to add to its numbers, and to form such organising committees as may be required, the committee to report to the R.I.B.A. Council from time to time." If anyone will second that I shall be glad. I do not think I have anything to say in explanation of it.

Mr. E. Guy Dawber: I will second that.
Mr. Lancheater: Can we pass that, and then go on to the constitution of the committee?

The President: This meeting is so big that if we are going to constitute a committee meeting here I do not know how long we shall be at it. I think if anybody has views and will give the meeting the benefit of them with regard to the constitution, and if you will trust me to work in conjunction with the Council in forming a committee on the lines that I gather the committee should be formed, judging from the conversation in this room, I think that would be the best way of going to work.

Sir Aston Webb: I think the best committee would be formed by yourself, sir, on the understanding that it is not limited to members of the Institute, but that it will include representatives from all known architectural societies. I feel sure you have the confidence of everyone in this room that you will carry out that duty honourably and to the satisfaction of all of us. I should like to see it placed in your hands.

The President: That is putting a great responsibility on me; but I will undertake to do the best I can, with the assistance of my Council. I will, therefore, put that resolution, which I have proposed from the chair, and which Mr. Dawber has seconded.

The resolution was carried unanimously. The meeting then terminated.

THE ARCHITECTS' WAR COMMITTEE.

The first meeting was held on Tuesday, August 18, 1914. Present: Mr. H. V. Lancheater (in the chair), Messrs. Walter Cave, Thomas E. Collett, G. Leonard Elkington, Claude Ferrier, H. M. Fletcher, L. Rome Guthrie, Edwin T. Hall, Gerald C. Horsley, Sir Thomas Jackson, Bart., Ralph Knott, F. S. Leslie, R. Goulburn Lovell, Edwin L. Lutyens, Sir Alexander Stenning, Sir Henry Tanner, Percy B. Tubbs, Paul Waterhouse, Adam F. Watson, Sir Aston Webb, Maurice E. Webb, John E. Yerbury, C. Stanley Peach (honorary secretary), Ian MacAlister (secretary).

In the unavoidable absence of the President of the R.I.B.A., owing to a domestic bereavement, Mr. H. V. Lancheater took the chair.

MEMBERSHIP OF THE COMMITTEE.

The Chairman stated, on behalf of Mr. Ernest Newton, that, in accordance with the resolutions passed at the representative meeting of the architects held at the R.I.B.A. on August 14, the gentlemen whose names he read had been invited to serve upon the committee, and that the following gentlemen regretted their inability to accept the invitation: Mr. H. B. Measures, Mr. F. B. Dunkerley, Mr. Gilbert Fraser, Sir William Emerson, Mr. A. B. Burling. It was thereupon resolved that the following gentlemen be also invited to serve upon the committee: Mr. J. E. Still, Mr. P. H. Wrench, Mr. Walter Gordon, Mr. Geoffrey Norman, Mr. S. D. Topley, Mr. H. A. Welch, Mr. Herbert Shepherd, Mr. W. Alban Scott, M.S.A., Mr. T. Wallis, M.S.A.

It was then resolved that the committee be called "The Architects' War Committee," and that the following members of the committee be appointed as honorary officers: Chairman, Mr. Ernest Newton, A.R.A., P.R.I.B.A.; vice-chairmen, Mr. George Hubbard and Mr. Percy B. Tubbs; honorary secretary, Mr. C. Stanley Peach.

The Secretary then submitted to the committee the resolutions passed at the meeting of the profession on August 11. The acting chairman stated, on behalf of Mr. Newton, that the question of the use of the R.I.B.A. galleries would be discussed at a meeting of the R.I.B.A. Council the same afternoon. He

also read the following statement drafted by Mr. Newton: "I hope to have an interview at an early date with Mr. Herbert Samuel, M.P., to discuss the question of the special employment of architects during the war. Mr. Samuel has already informed me that he will be glad to avail himself of our services if occasion arises. With regard to resolution No. 3, I propose this afternoon to ask the Council of the R.I.B.A. to make a substantial donation immediately to the Prince of Wales's Fund. With regard to the distress which may arise in the profession owing to the war, I propose to summon a special meeting of the Architects' Benevolent Society council to consider the situation, and, if it is found necessary, to send out a special appeal to the profession to contribute to a special war relief fund for the benefit of architects and those dependent upon them who may be in difficulties owing to the war.

It was resolved that the following gentlemen be invited to act as an executive and general purposes committee, with power to add to their numbers: Chairman, the President; vice-chairmen, Mr. George Hubbard and Mr. Percy B. Tubbs; honorary secretary, Mr. C. Stanley Peach; Mr. H. V. Lancheater, Mr. J. Alfred Gotch, Mr. Maurice E. Webb, Mr. H. Chatfield Clarke, Mr. Claude Ferrier, Mr. Edwin T. Hall, Sir Aston Webb, Mr. W. E. Riley, Mr. Ralph Knott, Mr. L. Rome Guthrie, Mr. Paul Waterhouse, Mr. E. T. Richmond, Mr. H. M. Fletcher; and all the provincial members of the general committee to act as correspondents for the executive committee; and that all suggestions received from architects and others with regard to the action to be taken by the profession should be referred in the first instance to this committee for consideration.

It was then resolved that the executive and general purposes committee be instructed to draft and despatch to the Right Hon. J. Pease, M.P., who has been entrusted by the Cabinet with the duty of receiving all offers of assistance in connection with the war, a letter embodying the general offer of help expressed in the resolutions.

It was resolved that the following gentlemen be invited to act as a Selection Sub-Committee or sub-committees, with power to add to their numbers: Sir John Burnet, Sir Aston Webb, Mr. J. Alfred Gotch, Col. F. S. Leslie, Mr. E. Guy Dawber, Mr. G. Leonard Elkington, Mr. Reginald Blomfield, Mr. Max Clarke, Mr. H. A. Welch, Mr. Sydney Perks, Mr. T. Edwin Cooper, Mr. Wm. Woodward, Mr. John E. Yerbury, Mr. Henry T. Hare, Mr. G. T. Hine, Mr. John Slater, Mr. R. Goulburn Lovell, Mr. Gerald C. Horsley, Mr. Alan E. Munby, and all the provincial members of the General Committee to act as correspondents for the selection sub-committee, and that the following memorandum, prepared by the chairman, be adopted as a basis for the work of this sub-committee, which should report to the executive and general purposes committee: "This sub-committee would be asked to compile lists of architects, with particulars of their qualifications, so that we may be in a position to give useful information to the Government or to any of its departments in connection with emergencies arising out of the war. The sub-committee would also act as an information bureau to help young architects who are called out for service in the manner suggested by Resolution No. 2. In doing their work it would be largely guided by the advice and knowledge of the provincial members of the general committee, who would be asked to act as its correspondents in dealing with applications from various districts."

It was resolved that the executive and general purposes committee be instructed to open a subscription list, to enable architects to contribute as a body to the Prince of Wales's National Relief Fund, or (b) a special fund.

It was resolved that the following gentlemen be invited to act as a General Sub-committee, with power to add to their numbers: Sir Robert Lomax, Sir Alexander Stenning, Sir Ernest George, Sir Henry Tanner, Sir Thomas Jackson, Mr. A. W. S. Cross, Mr. H. W. Wills, Mr. H. Aston Hall,

ARCHITECTURE. BY COMMENDATORE WALTER CRANE.

Mr. H. M. Fletcher, Mr. E. C. P. Monson, Mr. Herbert Baker, Mr. Walter Cave, Mr. Thomas E. Collcutt, Mr. Edwin L. Lutyens, Mr. Leonard Stokes, and all provincial members of the general committee to act as correspondents for the benevolent sub-committee.

The acting-chairman stated that after consultation with the War Office, the Architectural Association had decided for the present to take no action in regard to their military training proposals.

It was finally resolved that the executive and general purposes committee be requested to consider the following points: (a) The desirability of issuing to the profession or to the public an appeal to carry on building work to the utmost extent during the progress of the war. (b) The desirability of urging the Government to make arrangements to allow the railways to carry building materials.

"SCULPTURE" AND "ARCHITECTURE". ROYAL WEST OF ENGLAND ACADEMY, BRISTOL.

In our Double Number, published on January 2 last, we gave the two lunettes painted by Commendatore Walter Crane, R.W.S., which were the first pair executed in the central hall of the Royal West of England Academy under the Dome and illustrating "Painting" and "Craftsmanship." The remaining lunettes, which will also face each other, represent "Sculpture" and "Architecture."

The designs were chosen in public competition when Professor Lethaby, Professor Beresford Pite, and Professor Moria, all of the Royal College of Art, acted as assessors. Complete and suggestive as the original small scale studies were, all four of the

schemes, which are each 24ft. long by 7ft. high, have been elaborated in execution. One of the conditions of the competition was that the cost should not exceed £500.

The two lunettes (now exhibited in the large studio of Leighton House, by kind invitation of the committee, Mr. Crane's own studio being too small for their proper display) are part of a set of four, designed for the new building of the Royal West of England Academy, or, rather, the addition to the old building by Mr. S. S. Reay.

Two of these are already in position at Bristol, their subjects being "Painting" and "Craftsmanship." Sketches for them (to $\frac{3}{4}$ in. scale) may be seen in the room. It should be understood that these lunettes are to decorate the four sides of a dome. "Painting" and "Craftsmanship" face each other, and the two lunettes now shown, "Sculpture" and "Architecture," will also be placed opposite each other. In the one the Genius of Sculpture stands in the centre of the composition, holding a small golden statuette of Victory. On each side are symbolic figures of Grief (to the spectator's right), Fame, and Love, as being the principal supporters of the art of Sculpture. Further to the right is a young sculptor at work upon a bust he is modelling in clay. His sitter may be supposed to be an eminent poet or savant. Reliefwork is suggested by the figure with the medallion, and the Pegasus indicated behind the head of the sitter. On the other side a sculptor is seen at work upon a marble sphinx, and bronze work is suggested by the figure of a faun which the lady is admiring just beyond. The scene is an Italian garden, with steps, pedestals, balustrades, and cypress trees. On the steps at the feet of Sculpture is a cluster of emblems indicating the various departments of life and thought to which Sculpture contributes or adorns—such as Civic Life

and Government, Law and Justice, Religion, and the Honour of the World.

Architecture.—The Genius of Architecture in a purple robe, and wearing a mural crown, is seated upon a marble chair or throne of Late Renaissance design, with a designing-board on her knee, and compasses and measure in her hand, pondering a plan. Her supporters either side are figures representing Geometry and Proportion respectively. Builders and labourers are at work on a scaffold beside them, and a building is in progress under their hands, upon whose skill and energy all architectural design must finally depend. A curved colonnade of the Doric Order controls and completes the composition, while it suggests the historical basis of Classical architecture.

The paintings are executed in matt oil-colour, using rectified petrol spirit as a medium. It must be understood that they will be seen, when placed in their proper position in the building, at a much higher level—about 18ft. from the floor.

The architect of the reconstruction of the building was Mr. S. S. Reay, F.R.I.B.A., late of Bath, and now of the War Office, Pall Mall, S.W.

The last section of the subway for pedestrians across Cannon-street by the Mansion House Railway Station leading to Bow-lane was opened on Friday by Mr. A. C. Morton, M.P., on behalf of the streets committee of the Corporation of London. The first portion of the subway was opened on December 2 by the Lord Mayor.

The West Riding Rivers Board, at their meeting at Wakefield on Friday, resolved to ask all local authorities having sewerage or sewage disposal schemes in progress or in contemplation, to proceed with the work as soon as possible, so as to provide useful employment in their respective districts, and that the Local Government Board be asked to expedite all schemes submitted to them.

SCULPTURE BY COMMENDATORE WALTER CRANE

THE BRITISH ASSOCIATION.

THE AUSTRALIAN MEETING.

The meeting of the British Association in Australia this year seems to have been a successful one, notwithstanding the diversion of general interest there, as here, by the outbreak of war. The Presidential Address, by Professor William Bateson, M.A., F.R.S., on "Hereditarity," delivered in two parts, at Melbourne and Sydney, on August 14 and 20, was one of the most valuable of recent years. A verbatim report will be found in the issues of our other paper, the *English Mechanic and World of Science*, of August 14 and 21.

Of the Sectional Presidential Addresses, we give, as usual, that delivered to the Engineering Section, by Professor E. G. Coker, M.A., D.Sc., M.I.C.E., and also some other matter within our scope. Professor Coker's subject was

STRESS-DISTRIBUTION IN MATERIALS.

The subject of stress distribution in materials, which I have chosen for this address, is not one which an engineer can claim as his peculiar province, for it has been, and still is, a fruitful field of investigation for the mathematician, the physicist, and the geologist, and has always been so since the commencement of scientific inquiry. Indeed, it must have been the source of speculation and controversy ever since mankind emerged from a primitive state and began to fashion dwellings, weapons, and tools from the materials at command. The development of architecture from the earliest dwellings of savage races to the great temples of Egypt and Greece, the bridges and aqueducts of the Romans, and the Medieval buildings of Europe, all bear witness to the accumulation of practical knowledge of the properties of materials, and of the stress distribution in structures, which we cannot fail to admire, although we know far too little of the way in which these ancient structures were planned and constructed. The magnificent arched and domed buildings of the Roman period, and the stately cathedrals of later times, with their wealth of architectural form—tower and spire, flying buttress and vaulting—all show how considerable was the practical knowledge of stress distribution possessed by the master builders who planned and carried out these great structures. We, who inherit these buildings as a precious legacy of bygone ages, have at our command far greater resources in the accumulated knowledge of centuries of scientific discovery and invention, and can build more complex structures—great bridges of steel, towering frameworks covered by a thin veneer of masonry, and floating arsenals of the most bewildering intricacy. All these we can show to our credit as the result of the steady increase of scientific knowledge applied to practical ends; but even now knowledge of the stresses which come upon these complex structures and machines is relatively small. Scientific investigations of engineering problems of stress still lag behind constructive ability, and defective knowledge is obscured more or less by approximate theories, and buttressed by factors of safety, which serve in one instance, perhaps, but show in others that they have merely given a sense of fancied security with no real basis, and are more properly factors of ignorance, to be discarded at the earliest moment. Who, for example, can say with certainty what is the stress distribution throughout the compression members of a great bridge, built up of complicated steel shapes and plates, united by stiffening angles, gusset plates, and innumerable rivets. There is probably good reason for the belief that a great strut is relatively weaker than a small one, when both are designed according to the same approximate formulae now used in current practice, and engineers are unwilling to take the responsibility for such members in a great structure, without providing a very ample margin of safety to cover the contingencies arising from lack of precise knowledge of the strength of these members. So numerous are the problems which arise in the design and construction of machines and structures, that it is perhaps not unprofitable to devote a short hour to the consideration of some of the available means which an engineer can use as a guide for his applications of science to construction, since of whatever kind are the professional activities he pursues, his place in the scheme of affairs mainly depends on his ability to make machines and structures for directing and modifying natural sources of power in known ways, or applying them to new purposes as scientific discoveries advance the boundaries of knowledge. The power to do this depends to no small extent upon the ability to determine the distribution of stress in a structure, and the skilful manner in which material can be disposed for the required purpose.

It is of some help to our appreciation of the

achievements of the great constructors of past ages if we remember that they probably all held the erroneous view that materials of construction are perfectly rigid bodies, and, indeed, we know that, as late as 1638, Galileo Galilei was of that opinion, and that he came to an entirely wrong conclusion as regards the stress distribution in a loaded cantilever.

It required the genius and insight of Robert Hooke to make a really great step with his celebrated theory of the linear relation of stress to strain, and we can appreciate the glow of pride and satisfaction which he must have felt at his great discovery when he records, in 1675, that "his Majesty was pleased to see the experiment that made out this theory tried at Whitehall, as also my spring watch."

Hooke had, in fact, discovered the fundamental principle upon which a theory of the elasticity and strength of materials could be based, and it would be interesting to trace the great advances which were rapidly made from this new vantage-ground, whereby the main facts of the distribution of stress in simple members of structures became known, and a foundation was laid for the great advances of the mathematical theory. If I am silent upon the enormous developments of the modern theory of the strength of materials, it is not from lack of appreciation, but because I do not deem myself adequately fitted to discuss the great work of the elasticians, which all engineers admire, and so few are equipped to follow with the full battery of mathematical tools which have been pressed into service in the pursuit of this great science.

Among the greatest of the services rendered by early pioneers was that of Young, who was the first to notice that the elastic resistance of a body to shear was different from its resistance to extension or contraction, and this led him to define a modulus of elasticity for materials in compression. As Professor Love remarks, "This introduction of a definite physical concept, which descends, as it were, from a clear sky on the readers of mathematical memoirs, marks an epoch in the history of the science."

From the standpoint of the engineer, nothing is of more practical importance than the great discoveries of Hooke and Young that bodies like metal, wood, and stone are "springy" and have a simple linear relation between stress and strain. It is probably within the mark to say that nine-tenths of all the experimental investigations on stress distributions in structures have been entirely based on the fundamental principles which they enunciated, and new uses are continually arising. The recent application of the steam-turbine to the propulsion of ships produced a profound change in marine-engine practice, and incidentally involved an entire reconstruction of methods for obtaining the horse-power developed, which had been gradually perfected from the time of Watt, but were absolutely useless for the new system of propulsion. Hooke's discovery of the essential springiness of metals enabled engineers quickly to devise new instruments capable of accurately measuring the infinitesimal angular distortions of propeller-shafts, and from these to determine the horse-power transmitted by the aid of an appropriate modulus. The construction of tall buildings affords another example where advantage has been taken to determine the loads upon columns by measuring the minute diminutions of length as the structure proceeds, thereby affording a valuable check upon the calculations for these members, and a reliable indication of the pressures supported by the foundations.

The distribution of stress in buildings constructed of composite materials like concrete reinforced with steel has also been examined by similar methods, and much data for guidance in future constructional work has been obtained, especially in the United States of America. The still more difficult problems involved in the determination of the stresses in joints and fastenings of complicated structures have often been investigated by purely mechanical measurements of strain, and the experimental investigations of Professors Barraclough and Gibson and their pupils upon the distribution of stress due to riveted joints and curved plates of boiler-shells afford a notable example of the successful application of the measurement of small strains to a stress problem of great complexity. That "science is measurement" is here sufficiently obvious, and it seems only due to the memory of that great engineer, Sir Joseph Whitworth, to refer to his great mechanical achievements of a true plane and well-nigh perfect screw, which enabled him to measure changes of one-millionth of an inch, and thereby gave experimental investigations of strains a new impetus, which is reflected in subsequent work on the subject. Nor must we forget the no less important exposition, by Kelvin and Tait, of the scientific principles of instrument construction which have

done so much for the design of instruments for the precise measurement of strains.

Mechanical measurements cannot, however, completely satisfy all our modern requirements, since they are essentially average values, and fail to accommodate themselves to many of the problems which press for solution. In the quest for exact experimental knowledge, the measurement of stress at a point becomes of paramount importance, and we may, therefore, inquire what further means the researches of pure science have placed at our disposal for the determination of stress distribution in materials. It is well known that many materials, when tested to destruction, show a considerable rise of temperature at the place of fracture, especially in very ductile materials; but Weber was the first to discover that a metal wire when stretched within the elastic limit is cooled by the action of the load, and this result was deduced later from the laws of thermo-elastic behaviour of materials by Lord Kelvin, who showed that tension and compression loads produce opposite effects, and that materials which have the property of contracting with rise of temperature show thermal effects of the reverse kind. Although the changes of temperature produced by stress are small within the elastic range—less than 1 degree C. for most materials—yet their effect upon a thermo-couple is readily measurable if the equilibrating effects of surrounding bodies are neutralised or allowed for, so that stress distribution can be determined by thermal measurements at a point. The correction for such disturbing causes is usually an important factor, and is generally so large that experimental work is more suitable for the laboratory than the workshop; but if all necessary precautions are taken a linear relation of stress to strain can be shown to hold up to the elastic limit of the material, while above this point the break-down of the structure causes a rise of temperature of so marked a character that it has been utilised by several investigators as an indication of the yield point.

Experiments upon members subjected to tension compression, and bending, show that thermal phenomena afford trustworthy indications of the stress in materials so diverse as a rolled-sheet section, a block of cement, and beams of stone and slate. Although no attempt appears to have been made to investigate stress distributions of any great complexity, it seems not unlikely that thermal methods of investigation will ultimately prove of considerable value. The transparency of metals to Roentgen rays is another phenomenon which has often been suggested as likely to be of service for work on stress distribution. Mr. Howgrave Graham and I have examined a number of rolled metals under stress up to the breaking-point, without, however, discovering any change in the appearance of the material, as seen on a fluorescent screen. Although our experiments showed no perceptible change, it is, of course, not impossible that an effect may have escaped our notice. Another and still more fascinating field of research on stress distribution is afforded by the doubly refractive properties of transparent bodies under stress, a discovery made by Sir David Brewster almost exactly one hundred years ago, and but rarely made use of since by engineers, although Brewster himself immediately saw its value for experimental purposes, and suggested that models of arches might be made of glass, and the effects of stresses due to loading rendered visible in polarised light. Brewster carried his investigations further, by the invention of a "chromatic telemeter" for investigating the nature of strains, and consisting of plates or bars of glass subjected to flexure in definite ways for comparison with the body under stress. At a much later date (1841) Neumann developed an elaborate theory for the analysis of strain in transparent bodies due to load, unequal temperature, and set while, still later, the youthful genius of Clerk-Maxwell supplied an algebraic solution for the stress distribution in any plate subjected to stresses in its own plane. The early history of the development of this branch of science is, in fact, remarkable for notable contributions at long intervals of time, and the almost complete disregard by engineers of its practical importance.

The application of optical investigation to the determination of stress distribution in engineering structures and machines has, however, been hindered by causes which, although apparently insignificant, have been very real obstacles, and among these was the absence of a transparent material which could be fashioned into shapes suitable for investigating technical problems. It is not an easy matter, for example, to construct a glass model of a bridge free from internal stress, in the manner suggested by Brewster; and, moreover, glass is extremely fragile under load, especially in cases where the stress distribution in it varies very much, while the cost

of construction is very great. Happily there is now no necessity to employ glass for experimental investigation on engineering problems, since modern chemistry has supplied artificial bodies, such as the nitro-cellulose compounds used for many trade purposes, which have optical properties very little inferior to glass, are able to bear great stresses without injury, and also are capable of being fashioned with the ease and certainty of a wooden model. Photographic processes are also able to reproduce the brilliant colour effects caused by stress in transparent materials, so that permanent records can now be made for future reference. The construction of polariscopes for examining models on a large scale is very essential for technical research, and the great scarcity of Iceland spar of sufficient purity and size for use as Nicol's prisms has caused much attention to be paid to the construction of apparatus for producing plane polarised light by the aid of sheets of glass. Fortunately this presents little difficulty, and although the light is not nearly so well polarised as that obtained from a Nicol's prism it is sufficiently so for the purpose. Large quarter-wave plates of mica have also been constructed by my colleague, Professor Silvanus Thompson, F.R.S., for obtaining circularly-polarised light, and these have proved sufficiently exact and exceedingly useful for large models.

It is of importance to show that the stress distribution revealed by a polarised beam of light passing through an elastic transparent material in no way differs from that obtained by other means, and evidence is available in modern researches, especially by Filon, that the experimental results obtained with glass agree with those of the theory of elasticity, while a satisfactory agreement of a similar kind has also been obtained with nitro-cellulose compounds, although not in so complete and direct a manner. Such an agreement may be expected on theoretical grounds, since the values of the elastic constants do not affect the fundamental equations for stresses in a plane, and although for three-dimensional stress the effect of the stretch-squeeze ratio causes some difference, yet this is usually negligible. Most of the physical constants of glass have been determined with very considerable accuracy, but other transparent substances have so far received little attention, and their optical constants are not well known. The stress-strain relations of glass and nitro-cellulose have been determined with considerable accuracy, and a useful idea of their relations to metals may be gained from the values of the stretch-modulus, E , and the stretch-squeeze ratio, σ . The accompanying table shows some average values for a few important materials, and it is of interest to note that the stretch-squeeze ratios of cast iron and plate-glass are very similar, while the values of the stretch modulus are nearly as three to two. These two materials also possess other like characteristics: they are both very brittle, and possess well-developed crystalline structure, so that we may expect the properties of cast iron under stress to be very faithfully followed by plate-glass.

Material.	E	σ
Steel	30,000,000	0.25
Wrought iron	28,000,000	0.28
Cast iron	15,000,000	0.25
Plate-glass	10,500,000	0.23
Nitro-cellulose	260,000 to 300,000	0.40

The high values of the stretch modulus for steel and wrought iron are not, apparently, approached by any transparent material having similar ductile properties, but although nitro-cellulose has a stretch modulus of rather less than one-hundredth that of steel, its stress-strain properties are not unlike. In some recent experiments with a miniature testing machine fitted with an arrangement for recording the stress-strain relations of xylonite throughout the whole range of stress up to fracture, the main characteristics of steel appear on a very much reduced scale, and give additional confidence that the results of optical experiments on this material are applicable to metal structures. The complete analysis of stress distribution in a plate is not, however, a simple matter, and the analysis of Clerk-Maxwell was intended to provide a solution based on the properties of the isochromatic and isocline lines, coupled with the law that the optical effect is proportional to the differences of the principal stresses at a point, and to the thickness of the plate. A principal stress perpendicular to the bounding planes is assumed to have no optical effect, but since many cases have arisen where there are three principal stress components, it seemed desirable to examine such a case experimentally. It is a matter of some difficulty to arrange apparatus to stress a specimen in the direction of the incident beam, and at the same time observe the optical effect free from disturbing causes, since a transparent medium must be interposed for applying the required load,

and this will be subject to stresses which may interfere with the optical effect on the specimen.

Some observations on circular plates clamped at the edges and uniformly loaded over one face showed that the bending stresses produced in the plate caused very little optical effect, since the tension and compression stresses neutralised one another, while the shear effects also appeared to be practically negligible. The only remaining stresses of importance were those caused by the clamping plates at the boundary, which produced radial and circumferential stresses having circular symmetry, and as the optical effects of these latter disappeared at a small distance from the edge, a field of view was obtained in which the optical effects of load applied perpendicularly to the plate were quite small, even when the internal stresses were very great. Two circular plates clamped together to enclose a space between them may therefore be used as windows for observing the effect of a uniform pressure upon the transparent specimen, which latter may be a plate with its faces parallel to the end plates closing the chamber. If cubical compression is applied by a fluid, the principal stresses in the plane of the plate produce opposing optical effects, and any remaining effect is due to per-arrangement of experimental apparatus, therefore, took the form of a pair of transparent windows separated by an annular disc, and firmly clamped together by collars. The central chamber so formed was subjected to pressure of air, or other fluid, up to about one thousand pounds per square inch, and afterwards the specimen was introduced and the same pressure applied; but no visible change of effect could be observed. Finally, the specimen was set in the field of view outside the chamber, and pressure again applied by the fluid, but still no change was apparent. In all three cases the optical effects produced were small, and practically alike, so that the experimental evidence appears to warrant the conclusion that a principal stress in the direction of an incident beam of polarised light has no optical effect in a thin plate, or at any rate is so small that it may be neglected.

That the retardation between the ordinary and extraordinary rays is proportional to the stress difference perpendicular to the incident beam within the elastic limit of the material may, therefore, be taken as reasonably accurate, although future research may show that it is only an approximation, or even that it is more accurate to commence from a fundamental strain equation; but according to present knowledge there appears to be no warrant for such a procedure. A more pressing difficulty arises with regard to the optical constant connecting the wave-length retardation with the stress difference. The recent researches of Filon on glass show that the value of this constant is curiously dependent on the previous history of the material, especially as regards its heat treatment. Until further knowledge is gained on this matter it appears to be necessary to guard against errors in stress measurement from this cause by a careful selection and treatment of the material used, since for other artificial bodies we may find that the variation in the constant is not less in magnitude, and is at least as complex as in glass. In some instances the stress optical coefficient may be dispensed with, and Filon has shown, in cases where a theory of stress distribution has been worked out and it is desired to compare it with the results of optical measurements, that the isocline lines offer many advantages, since they are independent of photo-elastic constant, and the material need only be subjected to small stresses. The experimental analysis of stress distribution in a body depends on the possibility of finding the magnitudes and directions of the principal stresses at every point, and in practice it is found the simplest plan to determine the directions of stress from the lines of equal inclination obtained in plane polarised light, and to measure the stress difference by comparison with a wave-length standard, such as a Babinet compensator, or by comparison with a simple tension member set along one of the lines of principal stress, and loaded until the total effect produced is a dark field denoting a zero value. The difference of the principal stresses is then measured in terms of a simple tension. This alone is insufficient to determine the distribution unless one of the principal stresses is zero, and, in general, another independent measure must be obtained. This is very conveniently supplied by the change in the lateral dimensions of the plate under stress, since this change may be taken, in the absence of a third principal stress, as proportional to the generalised sum of the principal stresses throughout the thickness.

The determination of the lateral strains in a comparatively thin plate, forming part of a model of a machine or structure, necessitates measurements of extremely minute linear

quantities. If, for example, a plate of xylonite is taken, of the maximum thickness obtainable for optical work, a simple calculation shows that these strains must be measured to an accuracy of one to two millionths of an inch. Several instruments have been designed and constructed for this purpose, to fulfil conditions which appear to be essential for successful use. It is necessary to avoid all chance of injury to the surface of a transparent material, so that the measuring points of an instrument can only be pressed lightly against the surface, and the weight must, therefore, be supported independently of the model. In instruments so far constructed, the measuring mechanism is carried on a U-shaped frame, for convenience of movement from point to point of the specimen. One measuring needle is secured and operated by a calibrating screw, and the other is free to move a multiplying lever system, and thereby tilt a mirror to give an angular deflection, which latter is calibrated by reference to the standard screw when the instrument has been finally secured in place. In recent work the labour of accurately setting the instrument in a number of different positions has proved so great, that my assistant, Mr. F. H. Withycombe, has designed a useful adjunct in the form of a mechanical slide-rest, to effect the required changes easily and expeditiously. In one arrangement, a bracket carries the measuring instrument on a three-point support, and movement is effected by slides arranged to give displacements along three axes at right angles, and their amounts are measured by micrometer screws to an accuracy of rather less than one-thousandth of an inch.

These methods of stress determination avoid the difficulties of the Clerk-Maxwell analysis, which necessitates the determination of the equations to both families of isochromatic and isocline bands—usually a mathematical problem of considerable complexity. In some simple cases Mr. Scoble and I have verified the accuracy of the method of lateral measurements for determining the sum of the principal stresses by comparing the calculated stresses with the experimental values obtained in a plate of transparent material. We have lately carried these experiments a stage further, and have shown that the measured sums of the principal stresses in steel agree with the calculated values. This experimental solution, in fact, gives the stress at a point in a plate if the conditions are those assumed by the mathematical case of a plate where generalised equations of stress apply. It is at once obvious, if the utility of experiments on models of this kind is admitted, that experimental evidence is available on a variety of practical engineering problems covering a very wide field of practice, not merely qualitative, but quantitative, and approximating to the needs of the physicist and mathematician, and well within the known variations of the materials with which the engineer has to deal in his daily practice.

During the last few years much attention has been paid to the determination of the stresses in structural elements of primary importance; but only a small number of cases have been examined, since even the simplest problems have proved somewhat difficult, and much time and labour have been spent in perfecting optical and mechanical appliances to suit the special conditions required for investigations on transparent models. A simple example of a case easily examined and of practical importance is that of a tension member subjected to an eccentric load. The optical effects here show a linear distribution of stress due to the combination of direct pull and bending, while the neutral axis moves towards the tension side as the stress increases. Not only can these effects be measured, but if the specimen begins to fail, some indication is obtained of the way in which the stress distribution is changed to meet the new conditions, and there is found a tendency to an equalisation of the maximum stress at the boundary, although at present the form of the curve of distribution beyond the elastic limit is largely conjectural.

A case like that of a very short member subjected to direct compression is also not without interest, partly because it reveals unexpected difficulties. In the first place, it is not easy to apply a pure compression stress, and if the surfaces in contact are not of the same materials it appears to be practically impossible, since the lateral changes are unlike, and the shear stress is therefore produced at the plane of the surfaces in contact. In a short member this shear has a very important influence, and by interposing a thin layer of a material, such as indiarubber, between the pressure plates and the short transparent block, the artificial shear effect produced by the indiarubber is easily shown to influence the distribution throughout, and to increase the stress in a very marked way. Experiments on transparent materials show that

the increase of stress may be 20 per cent., or even more. Such an effect is known to take place when cubes of stone are crushed between lead plates, and optical investigations on models have enabled a quantitative measure of the effect to be ascertained in this and other cases, thereby confirming the theoretical investigations of Filon on the distribution of stress in such members under various practical systems of loading.

The local effects produced near the points of application of a load are usually of considerable importance, and their influence on the stress distribution in beams has been examined by Carus-Wilson. The stress effects produced by discontinuities in materials is also of considerable interest, and the cases arising from the necessities of construction are infinite in their variety. The practical importance of an accurate knowledge of the change in stress distribution produced by changes of section in a member is so thoroughly appreciated that it needs no insistence, and it has received much attention from a mathematical point of view. Thus the local effect of a spherical cavity in a member subjected to uniform tension or compression load has been shown by Love to double the intensity very nearly, while Kirsch has shown that a small cylindrical hole in a tension member trebles the stress intensity. If the hole is elliptical the increase of stress may be still greater, and Inglis has shown, among other interesting cases, that if the minor axis of the ellipse is parallel to the direction of the applied load in a tension member, the stress intensity is increased by an amount measured by twice the ratio of the axis of the ellipse. A crack, considered as the limiting case of an elliptical hole, is thus seen to give extremely great stresses at the ends, tending towards infinite values for an extremely fine crack.

Optical experiments afford an independent means of examining the alterations of stress intensity produced by discontinuities, and the results are found to agree remarkably well with those obtained from the theory of elasticity. The stress at the boundary of a small cylindrical hole in a plate has been found to be almost exactly three times the stress in the full plate, and the effects of holes comparable with the width of the tension member have also been examined in some detail. In the case of a rivet just filling the hole and exerting no tangential effect at the boundary, there is a lessened tension stress across the minimum section at the boundary hole, accompanied by a marked radial tension. These effects have been recently confirmed in a mathematical discussion by Suyeiro. Other cases give satisfactory agreement with calculation, and we may therefore feel some confidence that experimental investigation will prove useful in some of the very complicated cases arising out of engineering practice where analysis is difficult, if not impossible.

The effects of overstress in materials may also be examined by optical means, and although the laws relating to stress distribution in overstressed transparent material are not known, the general effects observed in simple cases are fairly evident. If, for example, a tension member of glass is stressed, there is no ductile yielding of the material, and the stress will therefore rise very rapidly at the boundary of a small hole, and fracture will therefore occur with a moderate load. If, however, a ductile transparent material is employed, and the material shows signs of failure at the hole, the breakdown of the structure spreads outwards as the load is increased, until we may have a condition in which within the elastic limit the curve of stress intensity at the minimum section accords with calculation; but at the overstressed part the stress tends to equalise, and the curve of intensity tends to become horizontal near the hole. The mean value of this part of the stress distribution may be inferred from the difference between the total load and the measured values below the region of failure; but the true distribution of the overstress has not been accurately determined, so that the shape of this peak is largely conjectural. The effects of groups of rivets such as occur in bridges, boilers, and structural members of all kinds afford ample scope for further inquiry; but before more exact knowledge can be gained of the condition of stress in a complicated riveted joint, it appears necessary to examine thoroughly the very simple cases. Mr. Scoble and I have examined the case of the load applied by one rivet to a plate with various amounts of overlap, and the stresses around the rivet-holes have been measured with fair accuracy. Other interesting cases of discontinuity in structure are afforded by the engine hatchways, gun-turrets, funnel openings, and the like in ships' decks, and some progress in this direction has been made by experiments on model decks subjected

to loads like those produced when a vessel meets the waves due to a head sea.

Even if the utility of transparent models is left out of account, it is generally acknowledged that many engineering problems are often simplified by the use of models of machines and structures on a small scale where circumstances forbid experimental examination of the actual work. No defence of their use is, I think, necessary, since the employment of models is a characteristic feature of British methods, not limited to engineers. Kelvin did not disdain their use, and his successors, who have done so much to advance knowledge of the ether and the atomic dust, have freely employed their great ingenuity in the construction of mechanical models and diagrams to explain their views, as in the Lodge cog-wheel diagram of the ether, the planetary systems of atoms of J. J. Thomson and Rutherford, and the grouping of elements by Soddy. Engineers have not the same great difficulties which confront those who are advancing the boundaries of pure science; their models are very much what they please to make them; but, even then, problems arise which are sufficiently difficult to tax all the resources of applied science. The behaviour of models considered as similar structures is, therefore a subject which engineers are bound to investigate in order to determine the effects of fixed and moving loads, the action of wind, the pressure and frictional effects of steam and other fluids, and many other problems. In the majority of cases the simplest and the most direct method is the experimental study of a model, from which to obtain the data required for calculating effects on a full-sized structure, and hence the laws of similarity have received a very close scrutiny. Although most valuable information can be obtained from models, their usefulness is clearly limited. The effects of the dead weight of a structure are proportional to the cube of the linear dimensions, and are, therefore, not usually measurable on a model except in exceptional circumstances, as, for instance, where elastic jellies are employed, as in the well-known investigations of Pearson on the stress distribution in reservoir dams. Nor are questions of stability easy to solve, since the forces producing instability are proportional to the size of the model. On the other hand, stress effects due to applications of load may be measured by the strains produced in a model of the same material, if the loads are proportional to the squares of the linear dimensions. The effects of applied load are studied even better in a model constructed of transparent material, since the variation of stress from point to point can be studied with much greater ease and certainty. As detailed models of this latter kind present some variations from the usual laws of similarity, it may be of interest to indicate their nature. Questions of deformation clearly involve the elastic constants of the transparent material and their relation to those of the proposed structure, while stress distribution in the solid is influenced by the value of Poisson's ratio. This latter effect is quite small for glass, but may become appreciable with other substance. It is negligible in a model of any material which approximates to a thin plate stressed by forces in its own plane. The optical effects for any given load are, moreover, independent of the thickness of the material, and depend upon the stress difference, so that colour effects are obtained which may be regarded as pictures of shear stress throughout the model. Modern researches on ductile materials like structural steel indicate that such materials fail at some limiting value of shearing stress, and since the places where these limiting values are reached in the model are visible to the eye, the weak places in the design of a structure can be ascertained and a faulty design corrected by purely experimental means. In this connection it is of interest to mention that M. Mesnager, the chief engineer of bridges and roads to the French Government, has recently constructed an elaborate model in glass of a design for an arched bridge of about 310ft. span. This investigation was considered advisable for a work of this magnitude constructed of reinforced concrete, in order to check the calculations, especially of maximum stresses in the arched ribs, which latter were assumed to be fixed at the ends.

The effects of reinforcements were allowed for by determining equivalent sections of glass for the members of the model. Many difficulties had to be overcome in the production of a model free from optical defects, but these were all successfully surmounted. The stresses in the model were determined by aid of a Babinet compensator, and formed a valuable check upon the calculations for a structure of this great magnitude and somewhat unusual design. In this brief and incomplete account of a small branch of applied science relating to engineering, the

fundamental importance of discoveries in pure science is manifest. The discoveries in pure science and their innumerable applications to practical ends are ever a potent factor working for the common good, and the value which the British Association places upon applied science was most cordially voiced by Professor Bateson in his Portsmouth Address when he said: "To the creation of applicable science the very highest gifts and training are well devoted," and, "The man who devotes his life to applied science should be made to feel that he is in the main stream of scientific progress. If he is not, both his work and science at large will suffer. The opportunities of discovery are so few that we cannot afford to miss any, and it is to the man of trained mind, who is in contact with the phenomenon of a great applied science, that such opportunities are most often given"; and, again, "If we are to progress fast there must be no separation between pure and applied science. The practical man with his wide knowledge of specific natural facts, and the scientific student ever seeking to find the hard general truths which the diversity of Nature hides—truths out of which any lasting structure of progress must be built—have everything to gain from free interchange of experience and ideas." Engineers who are more immediately concerned with the problems of directing the great sources of power in Nature for the use and convenience of man are indeed grateful to our president for these inspiring words, and trust that the ties which unite investigators in pure and applied science will never slacken, but will knit together more closely for a joint advance to a more perfect understanding and utilisation of the laws of Nature.

IRRIGATION WORKS IN ITALY.

By Professor Luigi Luggi, D.Sc., M.Inst.C.E.,
President, Italian Society of Civil Engineers.

The ordinary tourist who visits Italy and admires the splendid orange-groves round Sicily and Calabria, the industrial flower-gardens of the Ligurian Riviera, the luxuriant vegetable-gardens and orchards of Tuscany and Campania, or the extensive green meadows of exuberant trefol and lucerne of Lombardy and Lower Piedmont, if he has at all a tinge of poetry in his veins, will be apt to raise a hymn of praise to Providence, who has bestowed upon Italy such great blessings, and will grumble against its inhabitants accused of the sin of "dolce far niente." And, really, Providence has been very good in giving Italy a mild climate, with plenty of sunshine—although even in excess in some parts; but, besides this, Providence has not done much more than for any other nation of Southern Europe, if it were not that it has also given to Italy a very hardy race of people, full of resources, very thrifty, content with little, and ready to till the land cheerfully from dawn to dusk in the hope of getting good crops, notwithstanding the numerous drawbacks of a rather poor soil, of a very irregular rainfall—in excess during the winter months, and nearly absent for seven or eight months, during which a fierce sun would scorch the land and dry up all vegetation if the industry of man did not overcome these natural drawbacks. And, in fact, the prosperity of agriculture in the regions just mentioned—which are the most prosperous in Italy—is due exclusively to the incessant work of men who, far from enjoying much "dolce far niente," have applied, and are extending continually, the art of irrigation, which in Italy dates back from the time of the Etruscans, and has reached, indeed, a great perfection in our days. Without irrigation, the marvellous orange-groves, the bountiful orchards and vegetable-gardens, which give such valuable products for exportation to Central Europe and North America, would give but a scanty revenue to their owners; but especially the luxuriant and extensive meadows of the valley of the Po, which are intensely green all the year round, and give even seven or eight crops of fodder per year—could not exist, and barely one or two cuttings of grass could be raised, because the land during the five to seven months of the hot season remains generally without a drop of rain from the sky, and the vegetation is exposed to a pitiless sun; while during the winter months many regions of Italy would be flooded by the torrential rains. It is the work of the hydraulic engineer and the intelligence and persistence of the agriculturist that, by regulating the natural watercourses, impounding the water in reservoirs, or raising it from the subsoil or from the natural streams, and then distributing this water intelligently over the land at the proper time—that is, by scientific irrigation—that the waste sandy plains of Lombardy are transformed into the most fertile meadows of Europe, and the orange-groves around the coasts are so plentiful and beautiful as to induce Goethe to give to Italy the name of "the land where the

orange blooms." As the climatic conditions of Australia are very similar to those of Italy, it may be interesting—and, it is hoped, useful—to the citizens of the Commonwealth to know how Italians manage to get the best of the natural conditions of their native land, which, owing to the prosperous condition of agriculture from time immemorial—which leaves a good surplus for improvements and comfort—has made Italy the land of music, of poetry, and of arts. After this introduction, showing that irrigation is the principal factor of the advanced state of agriculture, and the principal source of revenue for the Italian nation, the author described the different ways of getting water for irrigation, and how it is distributed over the cultivated fields. When only small quantities are required, as for the orange-groves and flower-gardens, the water is generally raised from the subsoil, either by very primitive means, such as water-buckets (cicogne) moved by men, or norias, or rosary-pumps, moved by animals, as in Southern Italy, or by small but very modern centrifugal pumps moved by oil or electric motors, as one can see along the Ligurian Riviera and in many parts of the valley of the Po, where hydro-electric plants are very common. The cost of the water raised electrically—especially during the daytime, when the electric current is distributed at lower rates than at night—varies from 0.10 to 0.25 franc per cubic metre (from 43d. to 11d. per 1,000 gallons), and it is considered very cheap, for if raised by animals, or, worse still, by men, its cost would be respectively eight to seventeen times higher. And still the products grown with irrigation realise such high prices that this expenditure is justified, and also a very fair profit is left to the growers of oranges, early vegetables, and flowers, which find a ready market in Central and Northern Europe, especially during the winter months. The revenue of a good orange-grove varies from 2,000 to 3,000 francs per hectare (£36 to £54 per acre) per year. For irrigation on a large scale—that is, for fairly large farms of some 50 to 100 acres in extent, where ordinary vegetables, fruit-trees, vines, olives, etc., are cultivated—this price of water would be prohibitive, and, besides, the quantity would be insufficient. Then recourse is had to the rainfall—which, on the average, varies from 36in. in North Italy to 15in. in the South—by storing it up in reservoirs. These vary from the modest cistern of some few hundred cubic metres capacity to large artificial lakes of many million cubic metres formed in some valley of the Alps or of the Apennines by dams built either of earth, rock-fill, or masonry, the latter being generally preferred. There are already many large reservoirs, especially in Northern Italy, such as the Lagastrello, Brasimoro, Gorzente, Devero, Adamello, and others; but the largest of all is now in construction in Sardinia, across the River Tirso. The dam, of masonry, is 55 metres high (179ft.), and is of gravity section. It will impound 350 million cubic metres (12,250 million cubic feet) of water, sufficient to irrigate from 20,000 to 30,000 hectares (about 50,000 to 80,000 acres) of land capable of being cultivated for early vegetables, fruit, oranges, olives, vines, and such good-priced products. Several other dams are to be built soon in Southern Italy, the most important being on the rivers Bradano, Sila, Simets, and Fortore. The latter will be 75 metres high (243ft.), and will impound 410 million cubic metres (14,350 million cubic feet) of water, and irrigate about 100,000 acres. The water from all these artificial lakes is generally used first for motive power in some hydro-electric installations—which in Northern Italy are very plentiful, and this helps much in lowering the price of the irrigating water, and afterwards it is distributed by means of canals to the different farms at the price of about 0.005 to 0.01 franc per cubic metre (from 1d. to 1d. per 1,000 gallons), or at the "lump sum" or "annual rate" of from 80 to 120 francs per hectare (£1 10s. to £2 10s. per acre per annum). These prices, however, are still too high for ordinary irrigations, especially of meadows; and, besides, for very large extensions of land, the quantity of water that can be impounded in an artificial lake is always comparatively rather small. From a few cubic metres per inch to 20 cubic metres per inch in the Tirso district, and to 24 in the Fortore valley. In this case the water is obtained from rivers fed generally by some natural lake like the rivers Lucino, Adla, Oglio, Mincio, or by some glacier which, melting in the summer season, acts practically like a lake of frozen water, and in this condition are the rivers Zaira, Po, Dora, Orca, Adige, and many others. The engineering works consist of a submersible dam of very substantial masonry built across the river, and capable of raising the level of the water to that of the country to be irrigated; of some controlling sluices at the canal head; and of a main canal,

with lateral distributing ditches, provided at their intake with some apparatus for measuring the water to be delivered. Generally, the "Gipelett Weir," or some such overall weir, is used. No mechanical meters are adopted, except for very small deliveries. Many of these irrigation canals date back from the Middle Ages. For instance, the "Naviglio Grande" was built in the twelfth century, and is used also for inland navigation—in fact, it is a feature of these canals called "Navigli" to serve both for irrigation and navigation purposes. The "Naviglio Grande" is about 50 miles long, and has a capacity of 55 cubic metres (2,275cu.ft.) per inch; and in order of date come the "Muzza" with 60 cubic metres, the "Cremona" with 30 cubic metres, and scores of smaller ones. Of the canals of modern times, the most interesting, also from the point of view of the engineering features, are the "Villoresi" with 44 cubic metres, the "Marzano" with 30 cubic metres, the "Veronese" with 15 cubic metres, the "Zegliamento" with 17.5 cubic metres per inch. They are really models, both from the engineering point of view and the perfection of their administration; so much so, that many engineers come from all parts of the world to study them. The largest and longest of all is the "Cavour" canal, with a capacity of 110 cubic metres (3,850cu.ft.) per inch, and a development of fully 100 miles. It was built in 1855-65 by a private company that failed, and was bought over by the State. This canal, the most important in Europe, was the means of transforming an almost barren region of 250,000 acres of sand and gravel—useful only for growing timber and bushes—into the most fertile ricefields and meadowland of Italy, where the best Parmesan and Gorgonzola cheeses are produced. A still larger canal is about to be started, the "Emiliano" canal, with a capacity of 300 cubic metres (10,500cu.ft.) per inch, 120 miles long, and estimated to cost £12,000,000. The author described the most salient engineering features of some of these canals—i.e., their head-works—one of them at the "Ombrone" inlet is capable of receiving 600 cubic metres (21,000cu.ft.) per inch—and the numerous aqueducts and siphons over and under existing canals or rivers; pointing out that the irrigation canals of Italy are the life-blood of the national agriculture. He described also how the water is applied to the crops, the "rotations" or periods of irrigation used according to the nature of the land, its permeability, and the crops to be raised; concluding with the results obtained by irrigation, which are most satisfactory from the agricultural point of view. But the rent of the irrigated fields is more than double or treble the others, and from a financial point of view, with very rare exceptions, the results are most disappointing. It is not sufficient to build a canal carrying a large volume of water, it is necessary to sell this water in order to pay for the original cost of the canal and its ordinary expenses. But in order to use the water, it is necessary for the farmers first to prepare their own distributing ditches, then to level properly their fields, and learn how to apply the water to the land at the moment, and in the proportion most convenient, to decide which crops are the most profitable, and—where the land is not very permeable—it is also necessary to prepare drainage ditches in order to get rid of the surplus water that otherwise might damage the vegetation or produce an excess of parasitic plants. All this requires experience, time, and capital, and thus the irrigating canal is not in a condition to sell all its water for many and many years. In the best conditions it takes from twenty to thirty years—and sometimes even more—to dispose of all the water of a large canal. The "Marzano" crosses the province of Cremona, where irrigation has been adopted since the Middle Ages, and all the distributing ditches were already made when the main canal was built; in fact, its function is that of increasing the flow of the older irrigation canals; and yet it took fully thirty years before all its 30 cubic metres per inch of water were disposed of, although the conditions were most favourable. The "Villoresi," also in a region where irrigation is pretty well developed, after forty years has not yet disposed of all its water, and the financial conditions of its administration are far from being prosperous. This is the reason why the State considers it as its duty to help all these undertakings. Irrigation puts under cultivation large tracts of land of very little value, and almost sterile, and part of the population can thus find useful employment in the cultivation of land otherwise nearly useless. Italy has an increase of population of almost one million souls per year, and some 500,000 to 600,000 people are obliged to emigrate, especially to North America, or Central Europe, while some 100,000 go to Argentina, and 50,000 to other countries round the Mediterranean. To moderate this exodus, which is not beneficial to the country, the State encourages irrigation by granting a subsidy of three per cent. per year for

a period of ten years on the capital spent in the construction of the main canal and its principal branches, two per cent. per year for the following ten years, and one per cent. for another period of ten years. Then the subsidy ceases. But if the canal is arranged in such a way as to help to control the flood water of rivers, as when an impounding reservoir is also built—then some subsidy is also granted on the capital in the proportion of 20 per cent. to 50 per cent. of the expenditure. For instance, for the Tirso reservoir and canal, estimated at about thirty million francs (£800,000), the State pays three million francs for the beneficial effect on the state of the river, and grants a yearly subsidy of 150,000 francs (£6,000) for fifty years for the canal. After 99 years all the works become the property of the State. The conclusion is that irrigation is very beneficial to the individual farmer, when he can get the water by paying 30 to 50 francs per hectare per year (11s. to 17s. per acre), but not to the administration of the canal during at least the first thirty years; so the undertaking requires a great help from the State during this trying period. But in the meantime the State, in the form of taxation, and in the increased welfare of its citizens, reaps a large benefit from these works, which is more than sufficient to repay amply all the sacrifices made for this purpose. Without irrigation Italy would not be able to feed two-thirds of its present population; as it is, with its wonderful network of irrigating canals, it has become the "garden of Europe," and is now preparing to extend irrigation in order to be able in thirty years' time to feed a population of fifty to sixty million inhabitants. These are the miracles accomplished by scientific irrigation, and this explains also the reason why the Italian State encourages and helps financially all such undertakings.

THE DYNAMIC INCREMENT OF A SINGLE ROLLING LOAD ON A SUPPORTED BEAM.

By Professor H. Chatley, B.Sc.

The author suggested the use of the following formula for the dynamic increment of a single concentrated rolling load on a beam supported at both ends, the load being at the centre,

$$\delta F = W \left[\frac{1}{1 - \frac{2c}{L}} - 1 \right]$$

He showed that this is a close approximation to the solution of the complex differential equation which states the conditions of dynamic equilibrium in the given case. The dynamic increment is due to the vertical accelerations experienced by the load as the result of the deflection of the beam, and is, of course, liable to a "compound interest" effect. The latter will not ordinarily more than double the effect due to the static deflection alone. δF = the dynamic increment of the load W ; V = the horizontal velocity of the load; L = the span of the beam; E = the modulus of elasticity of the material of the beam; I = the moment of inertia of the beam section, assumed constant; g = the gravitational acceleration; $c = WV^2/L/gEI$.

A return issued from the Estate Exchange states the sales for last month at £1,499,195, compared with £1,495,830 for the corresponding period of last year.

The special fire service force of the British Fire Prevention Committee may shortly require for service 18 steam fire-engines with gear (horse-drawn or motor, with or without mechanics), 12 manual fire-engines or hose-vans, 12 landaulette motor-cars (with or without drivers). Offers to lend these should be addressed, with full particulars in writing, to Lord Londesborough and Mr. Edwin O. Sachs, at 8, Waterloo-place, S.W.

The sub-committee of the East Riding County Council appointed to deal with the question of the widening of the main road between Beverley and Hull recommend that the required land be purchased from the North-Eastern Railway Company at the price of £600 an acre, and that the county surveyor, Mr. J. Bickersteth, be instructed to prepare detailed plans and specifications for the proposed improvement.

The Middlesex County Council has decided to proceed immediately with the construction of the Great Western-road just authorised by special Act. Direct labour will be employed as far as possible. The council has also decided to put in hand improvements to road surfaces, and to begin the erection of a new sanatorium without delay. The Great Western road, 80ft. wide, and between five and six miles in length, will connect Chiswick High-road with the main Bath-road near Lavender Cottage via Brentford, Lampton, and Sutton. It will cost about half a million sterling, of which 75 per cent. will be provided by the Road Board, and a time-limit of seven years is allowed for its construction.

Building Intelligence.

PARK PREWETT.—At the last meeting of the Hants County Council, held at Winchester, the joint asylums committee reported that the six outer patients' blocks at the new county council asylum in course of erection at Park Prewett are well in hand; practically all of them are up to first-floor level, and part of one block is ready for the roof. Some of the one-story workshops are ready for roofing, and the water tower is now about 50ft. above the ground. The architects are still of opinion that the progress is not as good as it ought to be if the work is to be completed within the stipulated time. There appears to be considerable difficulty in obtaining an adequate supply both of materials and labour. The contractors (Messrs. Mussellwhite and Sapp, of Basingstoke) had, however, written assuring the council that the work would be completed within the contract time. Sixteen attendants' cottages were practically completed. One lodge had been completed, and another was needed for the asylum engineer, at a cost of £630. The report was adopted, and by 31 votes to 21 it was decided to build the engineer's cottage. The asylum will accommodate 1,600 patients, and the estimated cost is £253 11s. per head.

Mr. J. T. Wilson, surveyor to the Oakengates Urban District Council, has resigned, and is succeeded by Mr. V. Wilson.

Mr. Thos. Turbull has been appointed assistant chief engineer of the Canadian Northern Railway, with headquarters in Winnipeg.

The Indianapolis Architectural Club has elected the following officers for the ensuing year:—Mr. Elliott B. Hadley, president; Mr. Walter Sholer, vice-president; Mr. Clyde Stoughton, secretary; Mr. J. E. Woodard, treasurer; Mr. W. D. Leonard, chairman of current work; Mr. R. N. Williams, chairman of entertainment committee; Mr. John Parish, librarian.

Work upon the Alberta and Great Waterways Railway, now under construction from Edmonton to Fort McMurray, is advancing steadily, according to a recent report made by Mr. R. W. Smith, chief engineer, who has made an inspection of the line as far north as Lake La Riche, accompanied by Mr. Norman L. Harvey, Secretary of the Provincial Department of Railways, and Mr. E. H. Ellison, Divisional Engineer. It is expected that the grade will reach the lake this autumn.

Engineers of the Canadian Dominion Public Works Department hope to complete this autumn the survey of the Saskatchewan River, on which they have been engaged for three years. They are planning a new means of transportation in the form of a 5ft. waterway from the Rockies to Winnipeg, which would be sufficient for barge traffic. The cost is estimated at approximately three millions sterling, the principal items of expenditure being a series of locks along the river.

According to a recent consular report, the export of teak from Java during 1913 totalled 41,078 cubic metres, or about the same as in 1912. Owing to the rapid extension of the principal towns in Java, the demand for teak for building purposes has been very large, and prices have risen to such an extent that cheaper timber is being used by builders wherever practicable. British India has taken a fair quantity of Java teak, the exports of undressed logs to that country having been more than doubled. The demand in Europe has also been well maintained, and good prices have been realised.

The Deputy-Minister of Public Works for Alberta states, in his annual report, that 316 wooden bridges and 16 steel spans were constructed by the department in Alberta during 1913, and that 98 bridges were repaired. Eleven ferries were built and installed, and six ferry scows were replaced with new craft. Sixty ferries are now in operation in the province. A large amount of trunk-road work was completed. The department also reports the completion of the Parliament Buildings in Edmonton, the erection of the Government House in Edmonton, the Land Titles Building in Edmonton, and agricultural schools at Olds, Claresholm, and Vermillion. The work in the surveys branch showed an increase over previous years.

COMPETITIONS.

DUBLIN TOWN - PLANNING COMPETITION.—His Excellency the Lord Lieutenant of Ireland has decided that in consequence of the various difficulties arising from the present situation, created by the war, to postpone the time for sending in plans, etc., for this competition until April, 1915.

SUNDERLAND SECONDARY SCHOOL.—The result of the competition for this school, which is to be built on the Barnes Estate, is as follows: First, Messrs. Wm. and T. R. Milburn, of 19, Fawcett-street, Sunderland; second, Messrs. Crouch, Butler, and Savage, of Birmingham; and third, Mr. Aleck G. Horsnell, Doughty-street, W.C. The premiums were £100, £50, and £25. Mr. Edwin Cooper, F.R.I.B.A., was the assessor appointed by the President of the R.I.B.A. The Bede Collegiate Secondary School is to accommodate 450 boys at once, and to provide for a future extension by 150 places; the stipulated limit of outlay has £45 per scholar.

PROFESSIONAL AND TRADE SOCIETIES.

BEAUX ARTS ATELIER.—The Beaux Arts Committee at its meeting on August 19 decided that the work of the atelier should proceed as usual. The Esquisse for the first monthly competition will be held on Sept. 5 and 6, in accordance with the programme, and the first exhibition and criticism of the session will be held on Oct. 7, as previously arranged.

CHIPS.

At Ryhope, County Durham, a new council school has been formally opened. It has been built at a cost of £4,100, from plans by Mr. J. J. Eltringham.

The Shardlow Board of Guardians have adopted plans for alterations to the workhouse to be carried out at an estimated outlay of £7 650.

The rural district council of Great Ouseburn have requested Mr. E. J. Silcock, M.I.C.E., of Westminster and Leeds, to report upon the sewerage and sewage-disposal of Acomb.

Good progress is being made in the construction of the new filtration plant at Montreal, the cost of which will approximate 160,000dol. The general contractors, F. J. Jago and Co., have the foundations in.

The urban district council of Whickham County Durham, have received the sanction of the Local Government Board to the borrowing of the sum of £1,364 for works of sewerage at Dunston.

Burton-on-Trent Town Council have decided that an application be made to the Local Government Board for sanction to borrow £30,000 for the duplication of the sewage rising main.

A Midland Agricultural and Dairy College is about to be built at Sutton Bonington, about half a mile from Kegworth Station on the Midland system. The architects are Messrs. Everard, Son, and Pick, of Millstone-lane, Leicester.

Messrs. C. E. Deakin, Ltd., Montreal, have obtained the contract for the construction of a Roman Catholic orphanage on Decarie-avenue, Notre Dame de Grace, Montreal, plans for which have been drawn by Mr. Alphonse Piche, of that city. The building will be of stone and brick, with concrete floors, and is estimated to cost £35,000 sterling.

Work on the construction of the New Union Station for Toronto has commenced. Preliminary work includes the erection of a board fence around the Front Bay, and Yonge-street sides of the site, and excavation has been started. The foundation for the erection of the field office, at the corner of Bay and Front streets, is in course of excavation. This temporary building is intended for the accommodation of engineers, architects, and office staff. On behalf of the Board of Architects, Mr. H. Ferguson, who had charge of the building of the Chateau Frontenac, Quebec, and the Grand Trunk depot in Ottawa, will supervise the work. The P. Lvall Construction Company, who are the general contractors for the construction of the station, will be represented by Mr. Griffith. The cost of the buildings will be approximately 2,000,000dol

ARCHÆOLOGICAL.

THE ABBOT'S HOUSE AT ARBROATH.—At a meeting of the Arbroath Town Council the other day, the town clerk reported that he had written to the Secretary of His Majesty's Board of Works that the difficulty with regard to the board taking over the Abbot's House, which adjoins the Abbey ruins, seemed to be removed by the powers which had been given to the Commissioners of Works under the Ancient Monuments Consolidation and Amendment Act, 1913, to purchase any monuments which appeared to them to be desirable, and he had forwarded a copy of the memorial sent to the Treasury and had appealed on behalf of the magistrates and council to the Board of Works to carry out the proposed arrangement. The Board of Works had replied stating that though the Act of 1913 had empowered the Board to purchase as an ancient monument such a building as the Abbot's House, the funds at their disposal had not been increased to an extent commensurate with their increased responsibilities, and the Board regretted that while they would welcome such an improvement of the surroundings of the Arbroath Abbey as would result from the demolition of the old buildings and the formation of an ornamental pleasure-ground on the site, they were unable to assist the scheme in the manner suggested. The town clerk further reported that he had since been in London, and had seen the Secretary of the Board of Works, who promised to ascertain whether any payment could be made out of the annual sum voted by Parliament for the maintenance of the Abbot's House for a term of years in place of purchasing the building; but a letter had subsequently been received from the secretary stating that it was found that such a proposal would not be allowed by the Treasury. The council agreed to let the house for a term of years in the hope that the Government would purchase the building at a future date.

Mr. J. W. Croxford, surveyor to the Brentford Urban District Council, has had his salary advanced to £300 per annum.

Mr. R. O. N. Anderson, State Engineer, Perak has been promoted to the office of Director of Public Works, Federated Malay States.

Mr. T. Groves has been promoted to the office of State Engineer, Public Works Department, Negri Sembilan, Federated Malay States.

Technical schools are about to be built at Cookstown, Co. Tyrone, from plans by Messrs. Fennell and Clarke, Wellington-place, Belfast.

Mr. Gordon R. Folland, chief assistant to the county surveyor, Northern Division, Devonshire, has been appointed assistant county surveyor to the Somerset County Council.

The Clutton Rural District Council have instructed Mr. Davey, C.E., to prepare plans and a scheme for the severing of High Littleton and neighbouring parishes.

The Local Government Board has formally sanctioned the raising of a loan by the Croydon Town Council for its share of the cost of constructing the relief road from Thornton Heath to Purley.

The town council of Eye, Suffolk, has adopted plans prepared by Messrs. Morgan and Buckingham, architects, Norwich, for the erection of four cottages in two blocks on the Town Farm at Cranley. The estimated cost is £740.

The Road Board have made some changes in the organisation of their staff, and Mr. H. P. Maybury, late county surveyor of Kent, who became chief engineer to the Board in November last, has been appointed to a new post with the title of "Manager and Engineer."

Mr. R. G. Hetherington, M.Inst.C.E., held an inquiry at the Town Hall, Stoke-on-Trent, on Wednesday week, as to an application by the Stoke-on-Trent Corporation to borrow various sums for public works, consisting of £3,122 in respect of alterations to Loughton Town Hall; £1,050 for the purchase of land in Cromer-road, Hanley, for the purposes of a refuse destructor; and £11,113 for works of paving and surface-water drainage in Waterloo-road, Wedgwood-street, and Scotia-road, Burslem. The proposals were explained by the town clerk (Mr. E. B. Sharpley), the assistant borough surveyor (Mr. J. R. Heath), and Mr. J. H. Beckett, architect of the Loughton Town Hall alterations.

Our Illustrations.

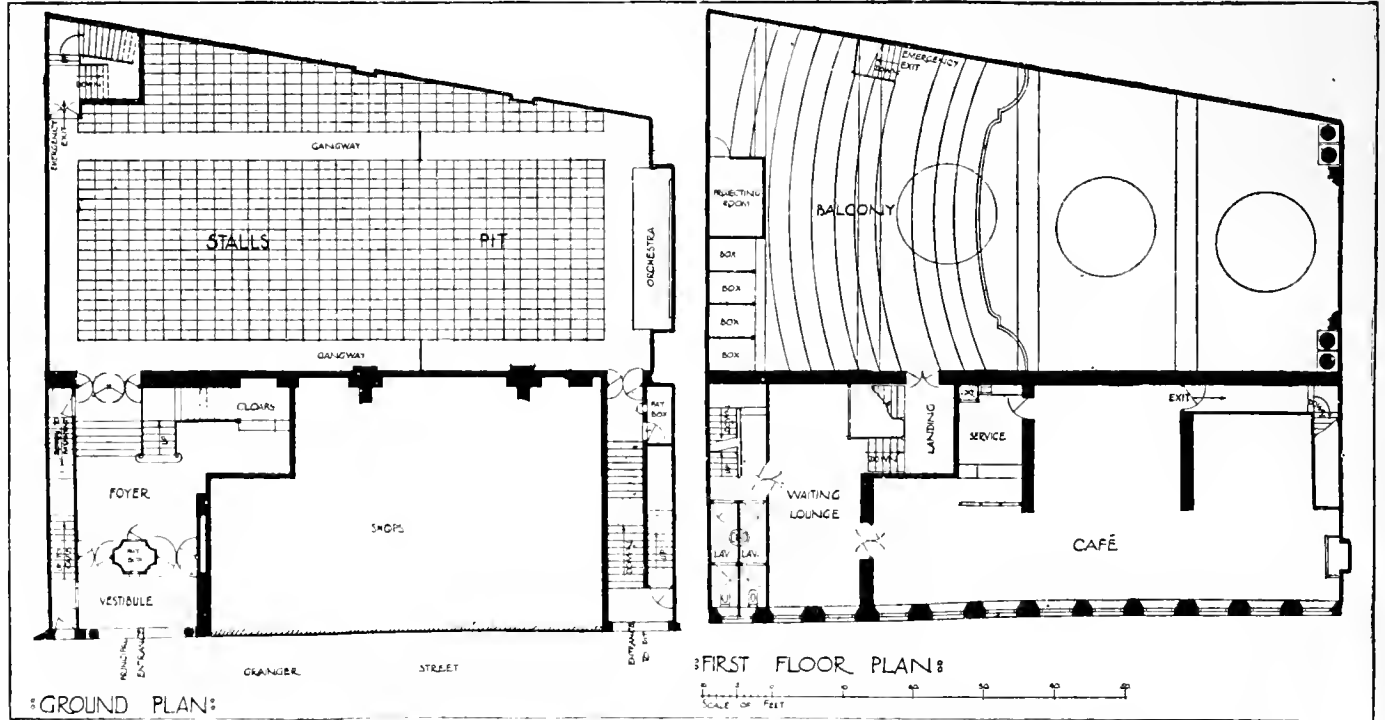

THE NEW TOWN HALL, MIDDLETON.

We illustrate the design placed first in this competition, for which 107 sets were submitted. The successful competitor is Mr. Alick G. Horsnell, of 5, Gray's Inn-square, W.C. The simple treatment of the exterior should harmonise well with the adjoining interesting half-timber building, the Old

BUSINESS PREMISES, GREAT PORTLAND STREET, W.

These buildings, which have recently been erected on a site at the corner of Great Portland-street and New Cavendish-street, are for business purposes, the lower floors being occupied as showrooms and offices by the Studebaker Motor-Car Company, and the upper floors as showrooms by various firms. The ground-floor showrooms have their own separate entrance at the angle, and have car-lift to the basement for their own exclusive

buildings standing on a part of the site have to be preserved intact, together with the out-offices and playgrounds, until some portion of the proposed new schools is ready for the accommodation of the children attending the temporary school. The following points have had a considerable influence in the motif of this successful design:—(1) Aspect; (2) desirability of getting all main entrances from principal thoroughfares; (3) large, airy, and open playgrounds; (4) the possibility of completing the whole of the boys' and girls' departments and

GRAINGER PICTURE HOUSE, NEWCASTLE-UPON-TYNE.—Messrs. PERCY BROWNE and GLOVER, Architects.

Boar's Head Inn—a factor of apparently considerable importance in this competition. The council chamber, mayor's parlour, and committee rooms are arranged en suite on the first floor, and have been given the principal position to the main front. These rooms are linked up with the assembly-room, which has also a separate entrance. The drawings indicate the materials and their general disposition.

THE GRAINGER PICTURE HOUSE, NEWCASTLE-ON-TYNE.

This building, comprising a theatre and café-restaurant, is situated in one of the principal streets of Newcastle-upon-Tyne. The premises were previously occupied as a large draper's shop, and it was necessary to gut the whole of the interior. The main entrances are built of Portland stone and granite, and the vestibule is lined with marble. All woodwork, except in the café, is in mahogany. The theatre seats about 960 people. It is in Neo-Classical style, and an effort was made to obtain a restful and refined colour scheme, the colours used being white and grey, with a little gilding. There are, it will be noticed, two entrances to the pit, one at each end. The café-restaurant is in the "Adam" style, with "Empire" detail in parts, and the whole is decorated in blue, white, and gold. The grate is bright steel, with Dutch tiles; "Adam" mirrors, designed by the architects, hang on the walls. Through open plaster grilles in the spandrels of the arches the music played in the theatre can be heard in the café. The kitchens, etc., are on the floor above the café, while a series of shops are built below the latter. The heating is by the Gould accelerated system, and ventilation by electrically-driven fans. The general contractor was Mr. S. F. Davidson, of Newcastle, and the architects were Messrs. Percy L. Browne and Glover, Pearl Buildings, Newcastle.

use; the upper floors have main entrance in Great Portland-street, with staircase and passenger-lift to all floors. The elevations are faced with Portland stone, with ground story of grey Cornish unpolished granite, and are of fireproof construction throughout. The top story has asphalt flat on top, with sloping front faced with green Westmoreland slates. The buildings are warmed throughout with low-pressure hot water, and lighted by electricity, with separate circuits to each floor. The Studebaker Co.'s showroom on ground floor has white ceramic mosaic floor, ornamental plaster ceiling, and is panelled throughout in Italian walnut, the finish of the rest of the suites on various floors being of the plainest description. The general contractors for the work were Messrs. Rice and Son, of Stockwell. The lifts are by Waygood-Otis, Ltd., of Falmouth-road, S.E. The architect was Mr. H. O. Cresswell, F.R.I.B.A., 17, Buckingham-street, Adelphi, W.C.

SELECTED DESIGN, ST. JAMES'S ROAD NEW COUNCIL SCHOOLS, NORTHAMPTON.

A competition, confined to architects practising in the borough and county of Northampton, was held for these schools. In all thirty-two designs were sent in, the whole of which were submitted to Mr. J. Osborne Smith, F.R.I.B.A., of Westminster, who placed design No. 1 A, submitted by Messrs. Blackwell and Riddey, of Kettering, first; Design No. 22, by Mr. Charles Hale, of the firm of Messrs. Talbot-Brown and Fisher, Wellingborough, second; and Design No. 16, by Mr. Alexander E. Anderson, of Northampton, third. The design placed first has been adopted by the Education Committee, and has received the preliminary approval of the Board of Education. We give the plan and general drawings thus chosen. The problem set to competitors was not an easy one to solve, owing to the position and nature of the site; moreover, the temporary school

their offices without disturbing the temporary buildings on the site; (5) the importance of getting all the ordinary classrooms away from the noise of the main thoroughfares; (6) complete supervision of the playgrounds from teachers' rooms. The special-subjects blocks have been placed near to the main thoroughfare, so that scholars from other schools in the borough, and the scholars from continuation schools attending these centres, may have easy access to their departments without disturbing the work of the school and without opening up any portion of the school playgrounds after ordinary school-hours. The building throughout is to be kept of a plain but substantial character, and will be built of hollow-brick walls (11 in. in thickness) above floor level, having glazed-brick dados on all internal walls and plastered above dado height. A natural system of ventilation will be adopted throughout, and every classroom has means of cross-ventilation. The estimated cost of the scheme as sent in in competition amounted to £15,371. The total accommodation will be for 1,200 children in three departments, and special-subjects blocks for the teaching of manual instruction, laundry work, cookery, and housewifery.

* In our description last week of the illustration of the Rathborne Convalescent Home at Parwich, the name "Rathborne" was printed "Rathbone," and "Parwich" was printed "Parwick."

At the meeting of the Bristol Sanitary Committee on Friday, the city engineer presented a list of roads which it was proposed to widen or improve subject to a satisfactory grant from the Road Board. The estimated cost of the whole work would be £17,500. The list was approved of, and it was agreed that application be made to the Road Board. This amount would be increased to £30,000 if there were included in the list works which might probably be put in hand under certain circumstances.

Currente Calamo.

At the special meeting of the Royal Institute of British Architects, held at 9, Conduit-street, W., last Friday afternoon, Mr. Ernest Newton, A.R.A., the President, in the chair, to consider in what way architects could assist the Government at the present, the following resolution, proposed by Mr. George Hubbard, was adopted: "That this representative meeting of the architectural profession offers its services to the Government in whatever capacity it can be most useful at the present time; also that, subject to the consent of the Council of the R.I.B.A., it offers the use of the Institute's ground floor and galleries, and that such intimation be forwarded to the proper quarters." Two other resolutions were agreed to—one proposed by Mr. J. A. Gotch, of Kettering, pledging members to look after the work of younger men who have joined, or may join, the colours; the other, moved by Sir Aston Webb, establishing a subscription list for architects for contributions to the Prince of Wales's Fund. The first meeting of the War Committee was held on Tuesday. We report both meetings elsewhere, and heartily congratulate the R.I.B.A. and all concerned on the promptness with which a businesslike start has been made.

Welcome evidences multiply that the building trade will suffer very slightly, if at all, by the war. The Government is still urging activity on all, and setting the best possible example in all its own departments. Capital is also evidently alive to the considerations we ventured to urge a fortnight ago, and we are confident that as soon as the holiday season is over, we shall see a solid and lasting revival of our industries, which will give an impetus to trade and employment in every branch which has long been anxiously hoped for. Now, therefore, is the time for all concerned to keep the ball rolling. Given the prosperity of agriculture, and the restoration to full work of the great group of trades that bulks next thereto in British work, and we believe that when peace is restored and the statistician counts up our national gains and losses, it will be found that the solid additions of real wealth to the capital of the country have more than balanced any temporary falling-off in ordinary commerce, while securing meanwhile full work to the millions who otherwise would have been dependent on the nation's charity. It is worth noting that the one trade which last week had not come into line with the rest did so last Friday, when the National Association of Operative Plasterers signed the working rules of the London Master Builders' Association. The whole of the trade societies concerned in the dispute have now come to terms with the Master Builders' Association under a working agreement.

The acceleration of building works by the Government to prevent unemployment is on every hand most welcome and satisfactory. The Board of Education have been requested by the Central Advisory Committee for the Prevention and Relief of Distress, which has been established at the Local Government Board under the chairmanship of Mr. Herbert Samuel, to call the attention of local education authorities to the desirability of making preparation to carry out as much building work as possible

in areas where an exceptional amount of unemployment is anticipated. The Board are confident that the authority will see the importance of making arrangements which will enable them to provide employment quickly if and when an emergency arises, so that the demands on the funds available for the relief of distress may be kept down. The Board will use their best endeavours to accelerate the consideration of plans submitted by or through local education authorities for the erection of new school buildings, or the improvement of existing school buildings, and have instructed their officers to assist the authority and their architect by every means in their power. The Board are assured by the Local Government Board that so far as they are concerned they will co-operate in this matter by accelerating as far as possible the consideration of applications for sanction to loans and of questions of sanitation, which fall particularly within their province. We do not believe many authorities will fail to second the Government's efforts; but wherever—as in the case we regretted to report last week on p. 228—the local authority shirks its plain duty, public-spirited citizens should at once draw the attention of the Government Department interested to the matter.

Mr. G. Topham Forrest, the county architect of Essex, has come in most timely fashion to the help of the builders who find difficulty in obtaining credit for building materials, owing to the attitude adopted by various firms. He has made arrangements with his committee (the Essex Education Committee) to issue certificates for work carried out on all current contracts every fortnight during the crisis, when a cheque will in due course be forwarded by the county accountant in accordance with such certificates. This arrangement will assist the builders most materially in keeping their contracts moving, so that as much work as possible can be kept going during the present time. We trust many will follow this admirable precedent, and we shall be glad to give publicity to any intimation that it is being done. We may add that the needless refusal of credit and anything like inflation of prices is being carefully noted by official and unofficial architects, and will not be forgotten hereafter.

We have thought many times ourselves that a new bridge is badly needed at Bristol to relieve the congestion at Bristol Bridge and facilitate transit from the city to Temple Meads Station. Mr. Samuel J. King publishes a sketch in the *Western Daily Press* of the 13th inst., which is evidently the outcome of careful study. He proposes the erection of a bridge over the Floating Harbour between Freshford lane and Welsh Back, in a direct line with Bell-avenue, Queen-square, so as to permit of the diversion of the large volume of heavy traffic that now passes through Baldwin-street and over Bristol Bridge, direct through Portwall and Freshford-lanes to the Temple Meads railway station. Compared with the manifold advantages, the cost would be comparatively nominal as the gradients are in every way suitable, being practically level the whole length of the suggested route. It is stated that the idea has the unanimous approval of the principal shipping firms, carrying agents, and transport-working unions, and if that is so, certainly now is the time to carry it

into execution, helping Bristol artisans and the prosperity of the city simultaneously, and earning the help the Government has promised to all similarly laudable objects.

T-squares will slip. A friend has sent us a cutting, showing an arrangement which he says is used in the draughting-room of the Stockbridge Machine Co., Worcester, Mass., U.S.A., and which, though simple, is found to work very effectively. The illustration explains the device, which is a magnetic

arrangement for keeping the T-square in place against the edge of the drawing-board. This is especially to be desired when the T-square is to be used in one position for a considerable length of time. The head is mortised so that two ordinary horseshoe magnets can be securely held in it. On the edge of the drawing-board is screwed a steel strip against which the T-square bears. Thus the magnets, and consequently the T-square members, always have an attraction for the end of the drawing-board.

The report of the Select Committee appointed to consider that perennial grievance, the heating and ventilation of the House of Commons, is a very tentative one. No extensive alterations are recommended until experimental trials have been made of a number of minor alterations which are detailed. Among those suggested are air trunks to be constructed beneath the floor of the galleries all round the House, and hot-water pipes under all benches, as is now the case under front benches. The effect of these experiments should be noted and a fresh committee appointed to make a full report next session. The Committee add that the rooms occupied by the Press at the rear of the Press Gallery are most inadequately ventilated, but they are convinced that no alterations would be of any material benefit without the removal of certain party-walls. So the Fourth Estate must wait till it is seen whether the rest of our four-hundred-pounders appreciate the hot air they are now to share with the occupants of the front benches—a doubtful benefit, we fancy!

Even amid our other obligations it is not too soon to remember that with war always comes pestilence. Cholera is already reported in the Serbian and Austrian armies. It is almost inevitable, if that is true, that the disease should take a terrible part in the war. The mortality among the stricken is always over 50 per cent. In times of peace and order cholera can be avoided with certainty by boiling all water and everything

that water may have touched. In war-time that is almost impossible. The infection is always water-borne, and if it is in the armies in Eastern Europe it may flow down the rivers into Western Europe. A river infected with cholera is literally a poisoned stream. It was the pollution of the Elbe with the cholera virus that brought the great epidemic to Hamburg in the nineties. At all our ports, doubtless, ordinary vigilance is being exercised; and, as trade grows, especially in foodstuffs from the neutral countries adjacent to the scenes of combat, it will be necessary that no precaution be omitted.

The Board of Trade has started a campaign to help British manufacturers to capture trade from the Germans, Austrians, and Hungarians. Architects and builders must help by ceasing to specify or use German-made materials and appliances. We have been surprised this week, during a visit to Somerset House, to find where the profits go to in certain British-registered companies. Readers, therefore, should do as we have done, if in doubt, and consult the names and addresses and holdings of the directors and shareholders. The advertisements of these German-dominated firms will not be found in our pages, and it is a matter for inquiry whether their appearance anywhere else is not accessory to trading with aliens. It is also a matter for consideration whether the professional and trade societies should not so search the register at Somerset House and issue confidentially to their members the information the latter may lack.

The Council of the London Society show courage at the present juncture in advocating a forward policy in effecting Metropolitan improvements. In the current issue of their "Journal" it is stated that the influential and practical committee who were appointed a short time ago to consider the feasibility of constructing a south-side Embankment to the Thames have prepared a preliminary report on their investigations. The committee are in complete agreement on one point at least—that Charing Cross railway-bridge must go, for its position on the south side of the river is one of the keys to the development of the whole of that quarter. It is suggested by the Editor of the "Journal" that a complete scheme should be prepared by the authorities and should be carried out in instalments as opportunities occur. In an article on "Railway Concentration South of the Thames," Mr. H. J. Leaning makes some drastic proposals, which are unlikely to come to fruition until the Money Market is a great deal easier. He deals chiefly with the rival lines to various districts in the suburban area served by the South-Eastern and Chatham railway systems, which were amalgamated ten years ago, but which still maintain six termini—two at the West-End and two in the City—and a useless network of independent lines. Disregarding for the present the alternative routes of the London and Brighton system, Mr. Leaning suggests that on the systems of the two first-named companies four termini and many intermediate stations might be closed and some twenty-nine miles of trunk line—entire sets of tracks—removed, the latter being replaced by 8½ miles of new underground railway. To provide the necessary capital to effect these changes and construct the new lines, he suggests that a loan might be issued with a

Government guarantee. The scheme is illustrated by a carefully-drawn map, but no estimates are forthcoming as to the probable expenditure that would be involved.

By a stupid "lapsus calami" on this page last week we credited the Metropolitan Asylums Board with the very proper precautions the Metropolitan Water Board has taken with regard to its reservoirs. The error was obvious.

F. McNEILL AND CO.'S "COMBINITE" ROOFING.

Architects and builders who may be unaware of the advantages secured by the use of "Combinite" roofing should send at once for a copy of the new catalogue, illustrating its method of application, just issued by Messrs. F. McNeill and Co., Ltd., Lamb's-passage, Bunhill-row, E.C.

"Combinite" is composed of several thicknesses of McNeill's "Lion" brand mastic asphalt, welded together and forming a homogeneous, flexible, and elastic layer, about ½ in. thick, of extraordinary strength, durability, and imperviousness. It is guaranteed for a long term of years, and photographs of some of the important buildings upon which it has been used will be found in the catalogue. They embrace all kinds of structures whereon the cost of maintenance and repair has been reduced to a minimum. It undoubtedly secures an absolutely watertight covering, and may especially be recommended where efforts otherwise to render leaking roofs impermeable have failed.

How often, by the way, do the residents of congested areas complain that they have no garden, and that because there is no room at home the children are forced to play in the streets, with their many dangers, and yet there is space above every building which would be available if, instead of pitched roofs, flat roofs were constructed. The adoption of flat roofs would not only reduce the capital outlay, but, with the use of "Combinite," render the whole roof available for gardens and other recreative advantages.

Mr. N. T. Gray, State engineer, Pahang, Federated Malay States, has been transferred to Perak; and Mr. J. E. Jackson has been promoted to the office of State engineer at Pahang, Federated Malay States.

On the North River, New York, a new pier is to be constructed, 1,050ft. long and 150ft. wide, and a corresponding half-pier, giving slips 360ft. wide, and having a depth of water of 44ft. Preliminary work has already made considerable headway, a cofferdam having been constructed on sheet steel piles, encircling an area of 800ft. by 300ft., so as to allow excavation of rock on the site to proceed in the dry.

The pollution of the river Stour at Fordwich with untreated sewage from Canterbury has recently been the subject of strong complaint to the Kent County Council. Dr. Greenwood's report to that authority, submitted at its last meeting held at Maidstone, show that a sufficient plant is now in course of erection at the Canterbury Sewage Works; but the County Council decided to write to the Canterbury City Corporation requesting them to give directions which will insure that there will be in the mean time no further pollution.

At the last meeting of the Malling Rural District Council, the surveyor submitted his annual return of the cost of roads in the district during the past year. This stated that the gross cost in respect of the 140 miles of roads and the nine miles of footpaths in the district, amounted to £8,655 (the estimate having been £8,377), and the net cost to £8,600, or £61 2s. 5½d. per mile, showing a serious increase in the expenditure on maintenance. In previous years the cost was as follows:—1902-3, £53 1s. 6d. per mile; 1903-4, £52 1s. 6d.; 1904-5, £53 7s.; 1905-6, £53 13s. 3d.; £1906-7, £46 8s. 9d.; 1907-8, £43 5s. 10d.; 1908-9, £44 3s. 4d.; 1909-10, £44 3s. 3d.; 1910-11, £49 11s. 6d.; 1911-12, £49 2s. 1d.; 1912-13, £53 17s. 7d. The Kent city surveyor's annual report, also just published, shows that in the Ashford division there are 103 miles of roads, which cost last year £13,725, or £132 per mile, while in the Maidstone division there are 87 miles of roads, costing £39,890, or £454 per mile.

Correspondence.

AMERICAN ADVERTISERS AND AMERICAN BUILDING CONSTRUCTION.

To the Editor of the BUILDING NEWS.

SIR.—It will not surprise you, but it may be gratifying to receive some confirmation of the remark you made in the above editorial in your issue of August 14—viz.: "The sun never sets on the well-placed advertisement in the BUILDING NEWS," and that "it is as well known in Australia, Canada, and India as in London." Our advertisements in this paper have brought many replies from all our Colonies, so much so that we are now giving our colonial agents' names in all our bigger advertisements.

I do not know who writes these editorials, but the writer has a most facile pen, and although I advertise in twenty different periodicals, I always read your leader. It is so extremely interesting, even when you talk about rubble-wall and such technical questions which can only concern architects. The article must have taken a terrible lot of trouble to compile, and every one of your advertisers should study your résumé of the American method of advertising building materials. The whole keynote to their advertising seems to be comprised in the word "specialise." An architect himself cannot specialise in every trade, some of which involve many years' study to obtain the best and most economical results. In many cases many experiments have to be made. I know that I myself have had to not only make hundreds of experiments, but to pay for expert tests in waterproofing cement, to enable me to suggest the most economical method for each condition of work. For instance, a 3 in. Pudloed cement rendering will not keep back water so well as 6 in. of Pudloed concrete, and yet in some cases 1½ in. of concrete will often secure the same watertight results as if 6 in. had been used. It all depends upon the conditions and the purpose for which the work is required, and these results have only been obtained by long study and experiments which an architect cannot possibly do. Now and then I hear from an architect who has made a special study of waterproofing by cement, and then we see eye to eye immediately. It is not surprising that we here and there find a specification where an architect has specified broken brick as an aggregate for a flat roof. A moment's thought generally shows him that that is a most porous aggregate, as indeed are sandstone, furnace-slag, and coke-breeze.

As you say, the advertiser who would attract all trouble-savers (and the one who is likely to obtain the co-operation of architects by relieving them of any anxiety when a contract is finished) is the one who "recognises the fact that every situation requires individual study, in order to determine what is best suited to meet the local conditions."

—I am, etc.

J. H. KERNER-GREENWOOD,
King's Lynn.

A secondary school is about to be built at Farnworth from plans by the county architect for Lancashire, Mr. Henry Littler, of Ribblesdale-place, Preston.

The corporation of Manchester have instructed the sanitary committee to consider and report upon the need for building municipal cottages in the Miles Platting.

Mr. L. D. Thompson, deputy county surveyor for Lancashire, has been appointed the county surveyor for Cornwall, in succession to Mr. A. E. Brooks. There were sixty applicants, and seven appeared before the Highways Committee.

The London and North-Western Railway Company are making very good progress with the work of constructing a subway under their line at Mossley Hill, Liverpool. This underground roadway represents the last connecting-link in the great circular boulevard—Queen's drive—which, for a distance of seven miles, will girdle the city on its outer confines.

Intercommunication.

GUINEAS FOR BEST REPLIES.

We offer a prize of one guinea every week for what we deem the best reply to any query appearing in this column, which we deem worth insertion.

Replies must be sent in over real name and address. No others can receive a prize. The Editor's judgment is final.

This competition is restricted to buyers of the paper, and with each reply a coupon cut from our front page must be enclosed.

Any number of replies can be sent, but a coupon of this date must accompany each.

All else being equal, brief replies will stand the best chance. We emphasise this, as some correspondents ignore the fact that querists want terse facts, not long essays. Any necessary illustrations must be in line only—no tints or washes—and about twice the size they are meant to be reproduced. We are unable to avail ourselves of replies that contain illustrations unless we receive them by first post on Tuesdays.

The right to withhold the prize in the event of no reply being received worthy of it is reserved by the Editor, who also claims the right to publish any other replies he may deem useful.

We divide the guinea equally between the senders of the four replies printed.

REPLIES.

[13147.]—**BOX SEXTANT.**—This instrument is used for measuring both vertical and horizontal angles up to 120°, giving the actual angle between any two objects to a single minute. Before one can readily grasp the idea of its use, and how easily and accurately angles are obtained, its construction and manipulation must be entered into and properly understood by the operator. The accompanying diagram shows in line the plan of a

box sextant. The index glass, which is silvered behind, is perpendicular to the face of the instrument, and is fixed to the index arm, which carries a vernier at its extremity that reads on the graduated scale, of which 30 divisions on the former coincide with 29 divisions on the latter. The divisions are 10' each, and these are sub-divided into 10" by the vernier from 0 to 150. The spaces on the index arm vernier denote each 30 minutes, or half a degree. From this scale the values of the observed angles are obtained. A magnifying glass is provided to assist the observer in readily reading the vernier. Now, any movement of the index glass casts a reflection into the horizon glass, which is rigidly fixed. The upper half of this glass is clear, and the lower silvered; this should be parallel with the index glass when the index points to 0°. The motion of the index arm is termed the plane of the instrument. Smoked or tinted glasses (in the writer's sextant, one of Stanley's, red and green) of various shades are provided for use in strong or sunlight. The angle of two objects in the horizontal plane is obtained by placing the sextant in the left hand, and then by operating the index glass and reflecting the image of the right-hand object upon the same point with the left hand, the reading of the scale will give the angle between the two. For the vertical plane the sextant is held in the right hand, and the image of the upper object reflected down by adjusting the screw attached to the index glass, till it meets the image of the lower object, and then the angle may be read off. If the sextant is provided with a tangent screw, the index arm is clamped, and the screw used for the final adjustment of the objects. For instance, a ray of light coming from the direction of the arrow on plain passes through the clear portion of the horizon glass down the magnifying telescope to the eye, while from X it strikes the index glass, and is reflected to the horizon glass. For setting off long offsets or right-angle lines, set the index to 90°, and walk along the station line with the horizon glass to the eye, till the staff or object is reflected. The perfect adjustment of the instrument is absolutely necessary, and this should be carried out in the first place to find the index error, if any. Let the zero cut, holding the sextant vertically and looking at the horizon glass, moving the index backwards and forwards on either side of zero, and if one perfect orb is seen, the horizon glass is perpendicular. If otherwise, it must be adjusted by the key provided on the instrument for this purpose. The difference between zero on the vernier and zero on the graduated scale will be the error, which is either added or deducted from the altitude.—Chas. A. Longley, 52, Ivanhoe-road, Denmark Park, London.

[13147.]—**BOX SEXTANT.**—This little instrument is most useful where a theodolite is impracticable, such, for instance, as a busy street, where the continuous traffic would make it impossible to set the instrument. At the same time, the sextant as thus used has not the accuracy of the theodolite, but for general purposes is sufficiently accurate, greater exactitude being obtained

by constant practice. The box sextant is very similar to the sextant, but only about half the size (3in. diam. as compared to 7in. diam.), and not being generally used for solar work is contained in a box, the lid of which when taken off is screwed on underneath to form a base or handle. A silvered arc, upon which are marked the degrees and sub-divisions up to 140°, is placed on the

top of the instrument, over which the index arm, with its vernier and magnifying glass, is worked by a screw having a rack and pinion motion to the index mirror inside, recording the angle between the selected points from a given station over which the operator stands. The angle having been ascertained, and also the length of the lines containing same being known, the remaining side and angles can be worked out, or two angles and the length of the side common to both will give similar results. A second mirror, or index-glass, which is silvered only on the upper half, is fixed perpendicularly to the instrument, and opposite the plate having the eye-aperture or telescope, if such is provided. The transparent glass enables the operator to view the required object, and to manipulate the screw of the index arm and its mirror until the second object is exactly over the first, when he will read the number of degrees, &c., that the angle makes. There are two important rules as to adjustment which require particular attention:—(1) The two mirrors must be parallel to each other when the zero on arc and vernier coincide. (2) The horizon glass to be perpendicular to the instrument. The former is connected by a nut and key on the top of the instrument; the latter—when incorrect will give two horizons (i.e., both figures should appear as on one horizon)—by a screw at the side, although there are variations according to the maker's speciality.—K. H. Read, Lecturer on Building Construction, Gloucester and Stroud Technical Schools.

[13147.]—**BOX SEXTANT.**—The following hints are useful when surveying with the box sextant. I think, in the first place, the instrument should be tested. (1) See that the horizon and object-glasses are in good condition—i.e., that the silvered edge of the horizon glass has a clean-cut line at its edge, and that the silvered portions of both glasses are in good condition. (2) That the rack and pinion of the index arm works smoothly, for if there is any jerking, trying to do accurate work is useless. (3) Adjustment of glasses. The index glass is adjusted by the maker, but can be tested by setting the index at about 60°, and looking at the image of the limb of instrument when the real limb and image should be in one continuous curve; if not, the instrument should be sent to the maker. The horizon glass to be in adjustment—i.e., perpendicular to plan of instrument. Place index at 0°, and sight to a well-defined object. If in adjustment, the reflected and direct images should be in one straight line; if not, there is "index error," which can be adjusted by causing the horizon glass to rotate by means of adjusting screw, until the objects appear in the same straight line. If the adjustment is not done, care must be taken to allow for index error on all observations. When the vernier is at zero, the two glasses should be parallel. After the above adjustments have been done, next comes the use of the instrument. This instrument is very handy for filling in detail on a survey, and has been found to be fairly accurate when work has to be done in a hurry. Its usefulness has been found when surveying in streets where there is a lot of traffic, and where a theodolite would be in the way, and also on fairly level ground; but on hilly ground great accuracy cannot be aimed at. When taking the angles clear-cut objects should be observed, such as buildings, posts, &c., and the work done on a clear day, as it will be found to be a nuisance if the weather is wet and foggy, when the glasses get misty, and the objects observed are not clear. When sighting to objects the instruments should, of course, be held immediately over the survey station. This can be done by hanging a plumb-bob suspended from hand on the underside of instrument and guiding it between the feet on the station. For greater accuracy a stand with ball and socket-joint should be used. In order that the angle measured should be the horizontal angle, the objects observed and eye should be on the same level; if not, the correct angle will not be taken. If one object is too high, a pole should be fixed in line between station and object, and the instrument sighted to pole. If one object is less distinct than the other, the less distinct object should be looked at direct, and if the other object lies to the left, the instrument should be turned upside down. For greater accuracy in reading the angles an instrument with a reflecting circle should be used, when the readings of the different verniers can be averaged, and error greatly diminished.—John Lamond, C.S.O., Town Hall, Manchester.

[13147.]—**BOX SEXTANT.**—It is assumed that F. Seroton is conversant with the mechanism and the

working of the box sextant. If so, then I think that the following will be of service. To use the sextant it should be held up to the eye by the right hand, so that (see sketch 1) the line of sight is in the direction of the tower, the operator standing exactly over the station X, and the vertical axis of the instrument is directly over its centre. With the left hand the milled-headed screw is manipulated so that the index mirror, being gradually turned in the direction of Z, shall reflect the image of the cross at this point, so that its centre is coincident with that of the tower Y, as in sketch 2. Thus the vernier will record the number of degrees and sub-divisions contained in the angle Y X Z. If the instrument, having been set at zero, does not show the object to which it may be directed to be exactly in the same vertical plane with the horizon and index glasses, it must be adjusted by a key being applied to the key-hole (specially for that purpose only) and turned right or left until the reflected images coincide exactly. The necessary rules to be observed with the adjustment of the sextant are:—1st. That the two mirrors are parallel to each other when the zero of the vernier coincides with that of the graduated arc. 2nd. That the horizon glass is perpendicular to the plane of the instrument. "How to ascertain your position on a plan of any ground by

Sketch 1.

Sketch 2.

Sketch 3.

the aid of the box sextant." In sketch 3 the position of the objects observed, that is, the chimney-shaft of the engine-house at A, the steeple of the church at B, and a final in the centre of the hotel roof at C, are as placed on one of the 1 in 2,500 scale maps of the Ordnance Survey. The angles subtended by the objects named were measured by a box sextant from the position D, which is, let us suppose, as yet undetermined on the map, the angle ADB being 20° 29' and BDC 60° 15'. The solution required is as follows:—Join AB by a straight line, upon which, as a base, construct the isosceles triangle ABE by setting off the angles ABE and BAE equal to half the supplement of twice the observed angle ADB, that is—

$$180^\circ - 2(20^\circ 29') = 69^\circ 31'$$

as shown. Again join B and C for another base, and, as before, construct an isosceles triangle BCF, setting off the angles BCF and CBF, determined as before from the observed angle BDC, that is—

$$180^\circ - 2(60^\circ 15') = 29^\circ 45'$$

as shown. With the apices E and F of these isosceles triangles as centres, and the length of their respective legs as radii, describe circles (inadvertently omitted in sketch 3), and the point D where their circumferences intersect determines upon the map the position of the observer when he took the observations, and as so found, it may be as well to say, as this is an actual case, quite agrees with his position, relative to other features of the ground shown on the map. In case the centres E and F coincide, the problem is intermediate; hence the advisability of taking more than two angular observations. A station-pointer is generally used in practice for the solution of this problem.—James Bromley, Rothwell Estate Office, Miller Arcade, Preston, Lancs.

A Royal Decree has been passed at Madrid approving a new project for reconstructing the La Galera mole at the port of Algeciras, the estimated cost of which is 1,409,170 pesetas (about £52,200).

Construction is to start immediately on an office building at Winnipeg, estimated to cost 600,000 dol., for the Prudential Trust Company, Ltd. The building will be thirteen stories high of stone, steel, and reinforced-concrete construction. The architects are Messrs. Ross and Macdonald, of Winnipeg, and the builders Messrs. Carter and Halls-Aldinger, of the same city.

LEGAL INTELLIGENCE.

A DISPUTED VALUATION AT BROMLEY, KENT.—Mr. H. M. Cobb, Official Referee, has given his reserved decision in the appeal of "Hall v. Commissioners of Inland Revenue" respecting a provisional valuation under the Finance Act, 1910, the objections to which were heard in London on July 17. The appeal referred to the property known as Nestdale, 13, Elmfield-road, Bromley; and the appellants, Mrs. Emily Hall, contended that the total or market value placed by the Land Valuation Department—viz., £1,350—was insufficient, having regard to the fact that it cost £2,100 to build in 1876, including £350, the cost of the land. Precisely similar property—the adjoining house, Eversleigh—realised £2,500 in 1905. From this had to be deducted £630, the price of an additional 90ft. of frontage, which left £1,807 as its value. The appellants contended that Nestdale was worth at least £1,700. For the Commissioners it was argued that what a house cost to build was no guide as to the price it would fetch in the open market. The official valuation was supported by Mr. Frederick Payne, auctioneer and surveyor, of Messrs. Baxter, Payne, and Lepper. The Referee has decided that the total value of £1,350 was correct, and he orders the appeal costs of the Commissioners to be paid by the appellants.

RE E. I. RICHARDSON, BUILDER, OF 7, HIGH-STREET, BOGNOR, SUSSEX.—A statement of affairs prepared by Messrs. Oscar Berry and Co., chartered accountants and auditors, 151 and 152, North-street, Brighton, was presented at the meeting of creditors held at Bognor on August 13, when the chair was taken by the largest trade creditor. The fully-secured creditors hold a charge on a freehold property in Park-road, Bognor, recently built by the debtor. The property is not quite completed; but it is estimated that £25 will cover the cost of completion, and that it should realise £1,500 when finished. These creditors also hold a life policy, the surrender value of which is £58 10s., and is issued to the wife under the Married Women's Property Act. It has been arranged for the wife to give up her interest in the policy subject to the matter being carried through under the deed. Thus the assets will be increased by £58 10s. The assets also include the sum of £331 9s. claimed to be due under a contract. This amount is at present disputed, and the matter will be one for the serious consideration of the committee. The furniture is claimed by the wife, and there appears to be no doubt the same is in order. There are no other assets. The debtor appears to have ceased work on the contract referred to on the 26th ult., and, having no other work on hand, he closed up on that day. One creditor had taken proceedings, and it became necessary for the protection of the estate that a deed of assignment should be executed. The debtor appears to have done a great deal of building during the nine years he has been in business at Bognor, but he has kept no "prime cost" books. An approximate deficiency account was put before the meeting. It was resolved that, subject to the wife giving up the life policy referred to above, the estate should be dealt with under the deed of assignment, for the benefit of the creditors, to Mr. Oscar Berry as trustee, a strong committee being appointed of the five principal trade creditors. The committee will meet next week to discuss fully the best method of dealing with the estate, particularly in reference to the amount claimed under the contract. The total liabilities are £2,450, and the estimated assets £1,499 17s., after deducting preferential claims amounting to £61 13s.

A David Clarke memorial hall is to be built at Borriskane, Co. Tipperary, from plans by Mr. T. J. Cullen, of Suffolk-street, Dublin.

The Plympton St. Mary Board of Guardians have received the sanction of the Local Government Board to the extension of the workhouse infirmary at a cost of £2,975.

Mr. Herbert Graham Dunlop, of Mar Lodge, Elgin, vice-president of the Moray Arts and Crafts Society, who died on January 11 last, aged thirty-eight years, left personal estate in the United Kingdom valued at £2,899, of which £2,342 is Scottish estate.

Teotative plans have been prepared for the erection of an "all-men" hotel at the north-west corner of New York-avenue and 17th-street, Washington, D.C. at an estimated outlay of £60,000 sterling. It is proposed to connect the new building with Knickerbocker Hotel on New York-avenue, opposite the Corcoran Art Gallery. Preliminary drawings have been prepared by Messrs. Ward Brown and H. A. Peaslee, architects, of Washington City, D.C.

Our Office Table.

The Institution of Mechanical Engineers, through the president, Sir H. Frederick Donaldson, have offered to the Prince of Wales the use of the vacant top floor of the extension building in Storey's Gate, Westminster, free of charge, during the continuance of the war for the administrative purposes of the Prince's Fund. The offer has been cordially accepted; but the Institution has been asked to allow the rooms to be used by H.M. Office of Works for the purpose of accelerating the designs and specifications for many public works which it is intended to put in hand as quickly as possible, in order to give employment. As this work is quite in character with the object of the Prince's Fund, the Institution has gladly fallen in with the suggestion.

A joint meeting of representatives of the Nottingham master builders and of employes was held on Monday night, to adopt any steps possible to prevent unemployment, and the following agreement was come to: "That with a view to spreading employment over as large a number of men as possible, the ordinary working hours of the trade shall be for the time being not longer than from 8 a.m. to 4.30 p.m., and that overtime be paid outside these hours as per present working rules. This agreement shall come into operation for all trades except painters on Wednesday next, the 19th inst., and for painters on Monday next, the 24th inst. This agreement is not to constitute a precedent."

The annual report of the city engineer and town surveyor of Newcastle (Mr. W. J. Steele) for the year ended March 31, 1914, states that the number of dwellings erected during the year (each flat being counted as a separate dwelling) has been 111, as against 145 in the previous year, which was then the lowest number recorded since 1882. In 1898, 91 per cent. were in flats, whereas last year 16 per cent. were in flats. Prior to 1909 it seemed evident that in several years more dwellings were erected than were necessary to meet the natural increase of population; but the rapid decline in building since that year has filled up the voids at such a rate that unless there is a marked increase in the number of new dwellings in the near future the shortage of houses will become a serious problem.

Dr. Meredith Young, M.D., D.P.H., the Medical Officer of Health for the County Palatine of Chester, and Chief School Medical Officer of the Chester County Council Education Department, has submitted his two reports for 1913 to the respective authorities concerned. They are, as usual, voluminous and interesting. The notes on housing in the former are worth attention. Among the appendices to the latter is a valuable special report on the use of dust-preventives in schools. Four preparations were tested. Two of these were compounds of sawdust, one containing calcium chloride, and both being impregnated with more or less volatile aromatic odouriser. The two others were light-coloured oils. Dr. Meredith Young is more favourably impressed with the possible benefits of the oils, the cost of which is less; but the ideal system for schools, as for houses, to his mind is vacuum cleaning; although, he remarks, it promises to be some time before a reliable one-man machine at a reasonable price will be available.

A composition patented by G. Lizieri, 5, Oakland-road, Newcastle-on-Tyne, for covering floors, walls, and roofs, and for lining reservoirs, cisterns, baths, etc., consists of one part of Florentine magnesite cement (made by calcining and grinding a volcanic rock found in Tuscany) and three parts of a mixture in about equal proportions of sawdust, ground cork, asbestos, and pumice, and, if desired, ground paper, the whole being mixed with a solution of soft soap.

At Lyons an artificial wood has been devised, consisting in transforming straw into a solid material having the resistance of

oak. The straw, after being cut into small pieces, is reduced by boiling to a paste, to which certain chemicals are added. When the paste has been reduced to a homogeneous mass it is put into presses, and planks, beams, laths, and mouldings of all sizes are readily made. This new material can be sawn like natural wood. As a fuel it emits a bright flame and little smoke. It is further stated to be adaptable to the manufacture of match-stems.

To make a waterproof, cleanable white-wash, 1lb. of glue is dissolved in 3½ pints of water. To this is subsequently added 3oz. of bichromate of potash dissolved in half a pint of hot water. These two ingredients are thoroughly mixed, and enough whitening then added to secure the right consistency. The mixture is applied to walls or roofs in the usual manner, and dries rapidly, while the action of the sun upon the potash and glue serves to render it waterproof. Such a white-wash adheres firmly to slate, glass, metal, masonry, or plaster, care being taken, if on plaster, to rub it well in with the brush. It not only affords an excellent protection from the effects of the sun's rays in hot weather, but acts as an admirable waterproofing to walls exposed to driving rains. When desired, it can be cleansed with a hose and cold water, or washed with a sponge.

According to the official returns of the United States Geological Survey the total quantity of Portland, natural and puzzolana cement produced in the United States last year was the greatest in the history of the cement industry, amounting to 92,949,102 barrels, valued at 93,001,169dol., compared with 83,351,191 barrels, valued at 67,461,513dol. in 1912. The total production of Portland cement in 1913 was 92,097,131 barrels, valued at 92,557,617dol.; the production for 1912 was 82,438,096 barrels, valued at 67,016,928. The quantity of Portland cement produced, 92,097,131 barrels, is equivalent to 15,623,620 long tons. Of the 113 producing plants in the United States in 1913, twenty-three were in the State of Pennsylvania, whose output was 28,701,845 barrels of Portland cement, the largest quantity produced by any one State. The second greatest production came from Indiana, with 10,872,574 barrels; and California was third, with 6,159,182 barrels. The natural cement produced in the United States in 1913 amounted to 744,658 barrels of 265 pounds each, valued at 345,889dol., compared with an output of 821,231 barrels, valued at 367,222dol. in 1912, a decrease in 1913 of 76,573 barrels and of 21,333dol. in value. The United States has a comparatively small export trade in cement. In 1913 the total quantity exported was only 2,964,358 barrels, most of which was Portland cement, valued at 4,270,666dol., compared with 4,215,232 barrels, valued at 6,160,361dol. in 1912.

Mr. C. F. Gettings, the Worcestershire county road surveyor, has appointed a "roller gang" staff to help farmers where desired. There are about four hundred such men.

Mr. R. Keeley, housing inspector to the corporation of Wolverhampton, has been appointed to a similar post under the Lancashire County Council at £225 a year. His colleagues in the health department have presented him with a handsome timepiece and pocket-wallet.

The death has taken place at Torquay, where he had lived for many years, of Mr. Alfred John Jukes Brown, F.R.S., F.G.S., the distinguished geologist. He was a member of the staff of the Geological Survey from 1874 to 1902. He was author of several students' handbooks on geology and a work on "The Cretaceous Rocks of Britain." In 1901 he was awarded the Murchison Medal.

A considerable number of the married men in occupancy of dwelling-houses at Rosyth hut village have rejoined the colours as Reservists. Messrs. Easton Gibb and Son, Ltd., the dock-yard contractors, have intimated that the wives and families of the reservists may remain in occupancy of the huts rent free during the absence of the breadwinners. In addition, Messrs. Easton Gibb and Son have indicated their willingness to provide the families so affected with a weekly supply of household coal.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Opening of Fifty-Ninth Annual Exhibition of the Royal Photographic Society at the Suffolk-street Galleries, Haymarket, S.W. Exhibition closes Saturday, Oct. 3. Mondays, Wednesdays, and Fridays, 11 a.m. till 6 p.m.; Tuesdays, Thursdays, and Saturdays, 11 a.m. till 10 p.m.

Mr. S. O. Stephenson, of Tipton, has been appointed gas engineer and general manager of the Worthing Gaslight and Coke Company.

The late Mr. Alexander Dowell, aged 92, of 13, Palmerston-place, Edinburgh, auctioneer and valuator, left personal estate amounting to £25,681.

The plans of Mr. J. S. Alder have been adopted for the first portion of a church at Flower-lane, Mill-bill, Hendon. The estimated cost is £4,500.

A Local Government Board inquiry was held at Scarborough on Tuesday as to the application of the corporation for sanction to borrow £16,070 for improvements to the South Cliff Gardens.

At the meeting of Glasgow Corporation held yesterday (Thursday) it was reported that properties in London-road, Summer-street, and Charles-street, Bridgeton, have been purchased as the site for a new public hall for the district.

The compulsory purchase order required by the Okehampton Rural District Council to give effect to their housing scheme for Chagford was received at Saturday's meeting of the rural council, and it was decided to approach the Devon County Council (the owners of the property) inquiring their selling price.

The Thornton Travelling Scholarships, offered to workmen on co-partnership garden suburbs, have this year been won by Messrs. L. C. Godfrey, Hampstead; William Pullen, Ealing; and Sidney N. Cartwright, Liverpool Garden Suburb. The projected tour to Germany has been abandoned, and the scholars will visit British town-planning centres instead.

In order to spread work out amongst the workmen and stave off unemployment as long as possible, the York Master Builders and Contractors' Association have decided, as from Monday in this week until further notice, to reduce the existing working hours from 6 a.m. to 5 p.m. to 8 a.m. to 5 p.m., with one hour for dinner. On Saturday the working hours are to be from 8 to 12 noon.

The private view of the annual exhibition of the Royal Photographic Society, to be held at the Gallery of the Royal Society of British Artists, in Suffolk-street, Haymarket, S.W., takes place to-morrow (Saturday). The exhibition will be open to the public from Monday next until Saturday, October 3, and a series of popular lantern lectures will be given on Tuesdays and Saturdays at 8.30 p.m.

The annual excursion of the Architectural Association was to have been held this week, with headquarters at Devizes, opening on Saturday last, the 15th inst., and closing to-morrow (Saturday). An attractive programme had been booked, with visits to Marlborough, Avebury, Lacock Abbey, Corsham, and Bradford-on-Avon among other well-known sketching centres; but, owing to the war, the meeting was perforce cancelled.

In order to meet the large amount of unemployment at Grimsby, the corporation has decided to push on with relief works. The mayor reported on Monday night that Sir George Gibb, of the Road Board, had promised a grant of £5,000 towards the Welby-road improvements on condition that the corporation put the work in hand at once. The mayor said he had visited the Treasury with regard to finding financial assistance towards the construction of a new fish dock, and the suggestion had been favourably received. These works will cost over half a million pounds.

A Local Government Board inquiry has been held at Dartford by Mr. R. G. Hetherington into an application by the West Kent Main Sewerage Board for sanction to borrow £35,300 for sewage-disposal, £1,275 for the construction of a light railway at Long Reach, Dartford, and £650 for redemption of title rent charge on the site of the works. The secretary, Mr. A. B. Coomber, stated that the total quantity of sewage treated per year at the present time was estimated at 3,321,135,000 gallons. The cost of treating 1,000,000 gallons of sewage, inclusive of the maintenance of all sewers and outfall works, all establishment charges and loan payments was £6 7s., which was easily the lowest of all town sewerage boards, the average being £17 12s. 1d.

Trade News.

WAGES MOVEMENTS.

BRISTOL.—The Bristol building trade dispute has been settled, and work was resumed on Monday. The master builders, following a meeting of their association, offered the operatives 3d. per hour advance in wages, to take effect immediately, and a further 3d. advance to take effect on January 1. A meeting of operatives to consider the offer was held at Olympia, Carey's-lane, on Friday, and it was resolved to accept the terms.

CANNOCK.—The strike of carpenters and joiners has been abandoned by the men, who have received a promise from the Cannock and District Master Builders' Association to reconsider the whole question of wages and hours six months hence. The strike had lasted three weeks.

EXETER.—The builders' strike at Exeter has come to an end, the men having accepted 3d. an hour increase.

KIRKCALDY POTTERS' STRIKE.—A settlement has taken place in this dispute, Mr. J. Lovatt, National Potters' Union, having written the employers accepting their offer to hold the dispute in abeyance during the war, short-time work being given the men.

OXFORD.—The award of Sir George Askwith, of the Board of Trade, with respect to the Oxford building trade dispute has just been published. Sir George met seven representatives of the men and their secretary and two members of the Master Builders' Association in London on August 10, and has given the following award:—That the rate of wages shall be as follows: Masons (banker-hands), 9d. per hour; masons (fixers), 9 3/4d.; bricklayers, 8 3/4d.; carpenters and joiners, 8 3/4d.; plumbers, 8 3/4d.; plasterers, 8 3/4d.; painters, 7 3/4d.; labourers, 6d.; scaffolders and stone-sawyers, or when working in water, 3/4d. per hour extra. That an advance of 3/4d. per hour to all aforementioned mechanics and labourers shall be made for the first full week of January, 1915, and thereafter. No overtime shall be worked except in cases of necessity. All overtime worked at the request of the employers shall be paid at the rate of time and a quarter for the first three hours from the end of the working day, following three hours at the rate of time and a half, and after six hours double time until starting next day; Sundays, Christmas Day, Good Friday, and Bank Holidays, double time. No alterations to be made by either employer or employed in any foregoing rules or existing rate of wages without giving to the other notice in writing, to be given on the first day of November in any year, and containing full particulars of the proposed alterations, but no notice to be given prior to November, 1915. Any alterations made to come into force for the first full week in the following May and thereafter.

Mr. Chadwick, of Maidenhead, has been appointed surveyor to the Faringdon Rural District Council.

The Salford Town Council on Wednesday defined the status of the borough engineer, for whom it was decided to advertise at a beginning salary of £900 a year.

A garden suburb is to be laid out on Castle Farm, Porthkerry, near Barry, Glam., from plans by Mr. T. Arthur Lloyd, architect to the Welsh Housing and Town Planning Association.

A party of members of the South Wales Institute of Architects visited last week the quarries of the Yockney and Harinam Park Stone Co., Ltd., and were shown round by the management. They afterwards proceeded on a tour of inspection of Castle Coombe, Corsham, and Lacock Abbey.

The Commissioners of Inland Revenue have decided to extend the time for giving notice of objection in the case of all provisional valuations served on or after or within 60 days previous to the 4th inst., until 60 days subsequent to a date to be notified hereafter to each person on whom a provisional valuation is served.

According to Inspector Duff, of the Local Government Board, who has visited three north-western counties, inquiring into the state of depression, Ellesmere Port is the hardest-hit town he has touched, and the whole well-laid machinery of that town, equipped for dealing with distress, is to be utilised at once. The urban district council are pressing the Local Government Board to grant them loans to enable them to push forward the making of new roads, and widening of existing roads, under the scheme of town planning.

LATEST PRICES.

IRON.

Table of iron prices including Steel Joists, Wrought-Iron Girder Plates, Steel Girder Plates, Bar Iron, good Staffs, Do., Lowmoor, Flat, Round, or Square, Do., Welsh, Boiler Plates, Iron—South Staffs, Best Suedehill, Angles 10s., Tees 20s. per ton extra.

Builders' Hoop Iron, for bonding, &c., £8 15s. to £9. Ditto galvanised, £14 to £15 10s. per ton. Galvanised Corrugated Sheet Iron—No. 15 to 20. No. 22 to 24

Table of galvanised sheet iron prices for 6ft. to 8ft. long, inclusive Per ton. Best ditto, Wire Nails (Pointe de Paris)—3 to 7 8 9 10 11 12 13 14 15 B.W.G. 8/3 8/9 9/3 9/9 10/3 11/ 11/9 12/6 13/6 per cwt.

Table of cast-iron sash weights, cut floor brads, corrugated iron, and galvanised wire strand prices.

Table of B.B. drawn telegraph wire prices.

Table of cast-iron socket pipe prices.

Table of cold blast and hot blast prices.

Table of wrought-iron tubes and fittings prices.

Table of gas tubes, water tubes, steam tubes, galvanised gas tubes, and galvanised water tubes prices.

Table of other metals prices including Spelter, Silesian, Lead Water Pipe, Lead Barrel Pipe, Lead Pipe, Tinned inside, Town, Lead Pipe, Tinned inside and outside, Composition Gas-Pipe, Town, Lead Soil-pipe, Tin, Over 4 1/2 in., Lead, Common Brands, Lead Shot, in 35lb. bags, Copper Sheets, sheathing & rods, Copper, British Cake and Ingots, Tin, English Ingots, Do., Bars, Pig Lead, in cwt., Pigs (Town), Sheet Lead, Town, Genuine White Lead, Refined Red Lead, Sheet Zinc, Old Lead, against account, Tin, Cut nails (per cwt. basis, ordinary brand).

OTHER METALS.

Table of other metals prices including Spelter, Silesian, Lead Water Pipe, Lead Barrel Pipe, Lead Pipe, Tinned inside, Town, Lead Pipe, Tinned inside and outside, Composition Gas-Pipe, Town, Lead Soil-pipe, Tin, Over 4 1/2 in., Lead, Common Brands, Lead Shot, in 35lb. bags, Copper Sheets, sheathing & rods, Copper, British Cake and Ingots, Tin, English Ingots, Do., Bars, Pig Lead, in cwt., Pigs (Town), Sheet Lead, Town, Genuine White Lead, Refined Red Lead, Sheet Zinc, Old Lead, against account, Tin, Cut nails (per cwt. basis, ordinary brand).

TIMBER.

CONSTRUCTIONAL.

Table of timber prices including Yellow Pine Deals, Quebec, per standard, Spruce Deals, St. Johns, Miramichi, Boards: Swag, Red Deals: Archangel 1st quality, St. Petersburg, Wyburg & Uleahorg Gede, Gothenburg, and Stockholm, White Deals: Crown, Seconds, Flooring: White and Planed—1st and 2nd quality mixed, 1st, 2nd, & 3rd quality mixed, Red Planed, 1st quality, Pitch Pine: Prime Deals and Boards, Lignum Vite, Yellow Pine Logs (waney board), Pitch Pine Logs, Birch: Quebec Logs, Oak: Anstrian Wainecot, Mahogany Gaboon.

FURNITURE AND HARDWOODS.

Table listing furniture and hardwoods including Teak (Burmese, Java), Oak Planks (U.S.A., Boards), Sequoia, Birch, Oak (Austrian, Prime boards), Walnut, Greenheart, Cedar, Satin, Mahogany, African, Lagos, Sekondi, Gaboon, West Indian, Rosewood, Lignum Vitae.

STONE.

Table listing stone materials such as Red Mansfield, Darley Dale, Red Corsehill, Closeburn Red Freestone, Ancaster, Greenshill, Chilmark, Hard York, Dn. do. 6in. sawn both sides, Portland Stone, Bath Stone, Beer Stone, Ditto, Portland Stone, Whit Bed. Base Bed.

SLATES.

Table listing slates including Blue Portmadoc, Blue Bangor, First quality, Enreks unfading, Permanent Green.

BRICKS.

Table listing bricks including First Hard Stocks, Second Hard Stocks, Mild Stocks, Picked Stocks, Facing, Flettons, Pressed Wire Cuts, Red Wire Cuts, Best Fareham Red, Best Red Pressed, Ruabon Facing, Best Blue Pressed, Staffordshire, Ditto Bullnose, Best Stourbridge, Firebricks, 2 1/2 in. Best Red Ac-crington Plastic Facing Bricks, Ac-crington Best Red Plastic Facing, Ac-crington ditto Second Best Plastic ditto, Ditto Ordinary Secondary Bricks, Ditto Plastic Engineering Bricks, Sewer Arch Brick, Chimney Bricks, Beaded, Ovolo and Bevel Jambes, Ac-crington Air Bricks, Ac-crington Camber Arches.

GLAZED BRICKS.

Table listing glazed bricks including White, Ivory, and Salt Glazed, Buff, Cream, Other, Best, Seconda. & Bronze. Colours, Stretchers, Headers, Quoins, Bullnose, Double Stretchers, Double Headers, One side and two ends, square, Two sides and one end, square, Splays and Squints, Plinth and Hollow Bricks, Double Bullnose, Rounded Internal Angles.

MOULDED BRICKS.

Table listing moulded bricks including Stretchers and Headers, Internal and External Angles, Sill Bullnose, Majorica or Soft Glazed Stretchers and Headers, Compass bricks, Camber arch bricks, Stretchers cut for Closers and Nicked Double Headers, Thames Sand, Pit Sand, Thames Ballast, Best Portland Cement, Ground Blue Lias Lime, Grey Stone Lime, Stourbridge Fireclay.

TILES.

Table listing tiles including Plain red roofing tiles, Hip and Valley tiles, Broseley tiles, Ornamental tiles, Hip and Valley tiles, Rnabon red, brown, or brindled, Ornamental ditto, Hip tiles, Valley tiles, Selected Perfecta roofing tiles, Ornamental ditto, Hip tiles, Valley tiles, Staffordshire (Hanley) Reds or brindled tiles, Hand-made sand-faced, Hip tiles, Valley tiles, Hartshill brand plain tiles, sand-faced, Pressed, Ornamental ditto, Hip tiles, Valley tiles.

OILS.

Table listing oils including Rapeseed, English pale, Ditto, brown, Cottonseed, refined, Olive, Spanish, Seal, pale, Coconut, Coclin, Ditto, Caylon, Ditto, Mauritius, Palm, Lagos, Ditto, Nut Kernel, Oleine, Sperma, Lubricating, U.S., Petroleum, refined, Tar, Stockholm, Ditto, Archangel, Linsed Oil, Baltic oil, Turpentine, Putty (Genuine Linsed Oil), Pure Linsed Oil, "Stority" Brand.

GLASS (IN CRATES).

Table listing glass including English Sheet Glass, Fourths, Thirds, Fluted Sheet, Hartley's English Rolled Plate, Figured Rolled and Repousse.

VARNISHES, &c.

Table listing varnishes including Fine Pale Oak Varnish, Pale Copal Oak, Superfine Pale Elastic Oak, Fine Extra Hard Church Oak, Superfine Hard-drying Oak, Fine Elastic Carriage, Superfine Pale Elastic Carriage, Fine Pale Maple, Finest Pale Durable Copal, Extra Fine French Oil, Eggshell Flattening Varnish, White Copal Enamel, Extra Pale Paper, Best Japan Gold Size, Best Black Japan, Oak and Mahogany Stain, Brunwick Black, Berlin Black, Knotting, French and Brush Polish.

CHIPS.

Mr. G. Bell, borough engineer of Swansea, has resigned. The services of Mr. Bell are to be retained as consulting surveyor.

The War Office have informed the city council of Winchester that they propose to erect 120 married quarters in the city, and to commence 80 of the same about the beginning of October.

A Local Government Board inquiry has been held at Felixstowe into an application by the urban district council for sanction to borrow £4,363 in order to provide and lay out a cemetery.

The Hartley Wintney Rural District Council have decided that the surveyor, Mr. J. R. Sistreron, who had expressed his desire to retire, should continue in office for one year. Mr. Sistreron is 73 years old, and has been in the service of the council for thirty-three years.

At a special meeting on Monday of the Evesham Joint Hospital Board, plans and estimates of proposed enlargements and improvements to the administrative block were considered and adopted, and it was agreed to apply to the Local Government Board for a grant in aid of the cost and for sanction of a loan.

At Monday's meeting of the Evesham Rural District Council, Messrs. Espley and Co., Ltd. wrote that they had stopped work on their Littleton housing scheme contract, owing to inability to purchase timber. The council considered that the contractors must be required to carry out the contract.

Owing to the existing conditions, an important and unanimous resolution has been agreed to by all the leading timber importers of London and Liverpool to the effect that only drafts for timber shipments against ocean bills of lading, with English or American marine policy, including war risks attached, be accepted.

The Metropolitan Asylums Board, at an emergency meeting held on Monday to consider the measures necessary in consequence of the war, decided, in order to facilitate employment during this period, to proceed forthwith with the execution of large building works to the value of nearly £200,000, for which tenders have already been accepted, and to expedite the progress of other building schemes in hand.

Mr. W. Redfern Kelly, J.P., M.Inst.C.E., has resigned the post of engineer-in-chief to the Belfast Harbour Commissioners on completion of fifty years' service. Mr. Kelly will act as consulting engineer to the trust for one year. Mr. Kelly entered the services of the Harbour Board as an apprentice under the late Mr. Wm. H. Lizards in 1864. In 1904, on the sudden death of Mr. G. F. L. Giles, previously engineer to the Southampton Harbour Board, he was appointed chief engineer. Mr. T. S. Gilbert, the present assistant engineer, will succeed Mr. Kelly.

The Hauenstein Tunnel on the Basle-Olten line in Switzerland has been pierced, and military troubles permitting, will be opened in June next. The tunnel is 5 miles 94 yards in length, and was commenced on February 1, 1912. When completed, it and its approach lines will replace the existing line between Sissach and Olten. On the latter line there is a tunnel 1 mile 968 yards in length, constructed in 1854. There is practically no difference between the lengths of the old and the new routes, the reason for the construction of the new line being to secure an easier gradient. On the new route the maximum gradient will be 1 in 95, and in the tunnel the gradient will be 1 in 133 for about 1/2 miles, and 1 in 666 for the remaining distance. As a result of the improved gradient, twenty minutes will be taken off the time of the journey between Basle and Olten. The contractors for the new tunnel were the Julius-Berger-Tiefbau Company, of Berlin, and the price was £792,709. The tunnel has been pierced about eighteen months in advance of contract time.

TRADE NOTES.

Claridge's asphalt is being used on the new building of the Institute of Chemistry, Russell-square, W.C.

Under the direction of Mr. Arthur J. Stedman, L.R.I.B.A., architect, Farnham, Surrey, Boyle's latest patent "Air-pump" concealed ventilators have been applied to Bentley Schools.

We understand that all the concrete floors in the basement of the Nurses' Home, South Manchester Guardians, Withington, have been treated with the powder Pudlo—which makes cement waterproof—to prevent rising dampness.

Messrs. Doulton and Co. Ltd., the Royal Doulton Potteries, are supplying the seven specially made "down-draught" stoves for the Burton-on-Trent Infirmary, under Messrs. Henry Beck, architects, Burton-on-Trent. These are glazed pottery stoves with fireclay interiors.

Messrs. Carter and Co., Ltd., of Poole, and 29, Albert Embankment, inform us that it is their intention to exert every effort to keep their factories running during the war, and to provide work for all their workpeople. They will greatly appreciate the support of architects and contractors.

The town council of Nelson, Lancs. have adopted plans for public abattoirs to be built at an estimated cost of £14,000.

The borough council of Lambeth have adopted proposals for improving Providence Wharf at an estimated outlay of about £10,000.

The Deal Town Council have appointed Mr. Barwood Cullen, of Western-road, Deal, water surveyor. Mr. Cullen was formerly assistant under his father, Mr. J. F. Cullen, the late water surveyor.

At the meeting on Monday evening of the town council of Okehampton the resignation of Mr. F. J. Worden, borough surveyor, was accepted, and instructions were given to advertise for a successor.

Mr. Douglas Thomas Franklin, J.P., of Thaxted and Bishop Stortford, auctioneer and estate agent, who died at Brighton on May 29, aged fifty-five years, intestate, left estate of the gross value of £5,802.

At Montreal plans are in progress preparatory to the construction of a stadium on Pine-avenue for McGill University at an estimated expenditure of 100,000 dol. Messrs. Nobbs and Hyde, Montreal, are the architects.

Well over a million gallons of tar were used last year on the surfaces of Kentish roads. The county council used 956,625 gallons on the main roads under its control, and 22,086 gallons on the repair of footpaths. The council also paid over £7,000 for tar used by urban authorities in the county. Tar-painting proper cost the county council in all £33,332 4s. 10d.

The decoration of St. Andrew's Chapel at the Roman Catholic Cathedral for Westminster, the gift of the Marquis of Bute, will be completed by the end of the present year. The mosaics from the designs of Mr. Schultz are being prepared by Signor Gaetano Meo, with the aid of six mosaic-workers. The style is Byzantine, in consonance with the work of the late Mr. J. F. Bentley.

The engineer in charge of the Mozambique-Nyasaland Railway has been authorised to spend some £37,000 on commencing work. The line will be about 342 miles long, of which only 62 miles will be in British, and the remainder in Portuguese territory. The cost is estimated at about £3,500 per mile. There will be two bridges over 300ft. long, and several smaller ones. It is proposed to complete the line in five years.

TENDERS.

*. * Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender; it adds to the value of the information.

ABERSYCHAN.—For supply of a motor fire-engine, for the urban district council:—
Merryweather... .. £990 0 0
(Recommended for acceptance.)

ACTON.—For erection of a park-keeper's lodge, &c., at the North Acton public playing fields, for the urban district council:—
Mitchell, F. W., Ltd. (Accepted) ... £827 0 0

AXMINSTER.—For constructing sewage-disposal works, and laying about four miles of sewers, for the Axminster Rural District Council. Messrs. Phillott and George, 31, Promenade, Cheltenham, engineers:—
Thompson, B., Peterborough ... £11,553 0 0
Riley, J., Cheltenham ... 9,572 13 6
Hyslop, A. and T., Manchester ... 9,373 17 2
Pollard, Ltd., Taunton ... 9,236 12 0
Fothergill, Ltd., Exeter ... 9,130 11 9
Sherdlow, J., Leicester ... 9,040 4 4
Wilkinson, T., Poole ... 8,951 0 0
Saunders, S., Bournemouth ... 8,911 0 0
Ewart, J., jun., Taunton ... 8,412 19 8
Harrow, H., Exeter ... 8,393 5 4
Harris, E., Glaston Hydon ... 8,137 0 0
Grounds and Newton, Bourne-
mouth (accepted) ... 8,084 2 4

AYR.—For works at Loch Finlas, for the corporation:—
Paton, W., and Sons, Ayr... .. £1,858 17 0
(Accepted in place of R. C. Brebner and Co.,
withdrawn.)

BARNOLDSWICK.—For paving in Skipton-road and Gisburne-read, for the urban district council:—
Bradley, J. (accepted) £575 1 6

BARNOLDSWICK.—For road works in Rainhall-road, for the urban district council:—
Morphet, J. W. £592 4 5
(Recommended for acceptance.)

BARNESLEY.—For completing the following streets, for the corporation:—
Milton-street:—
Hood, J. £164 10 2
William-street:—
Hood, J. 251 19 1
(Recommended for acceptance.)

BLYTH.—For erecting workshops, stores, &c., for the urban district council. Mr. R. Grieves, Seaford-road, Blyth, architect. Quantities by Messrs. Savage and Rowe, Newcastle-on-Tyne:—
Cork Bros. £1,219 1 0
Robson and Waddle 1,100 3 0
Hedley and Sons 1,081 0 0
Baxter, R. (accepted) 1,045 0 0
All of Blyth.

BO'NESS.—For the construction of footpaths, for the corporation:—
Hardie, J. £324 2 7
Begg, J. R. 323 19 9
Sneddon, R. 305 18 0

BROMLEY CROSS.—For the supply, delivery, and erection or laying of overhead lines and underground cables, for the Turton Urban District Council. Mr. F. C. Sprigg, electrical engineer:—
Dewhurst Engineering Co., Ltd.,
Sheffield £2,354 5 0
Siemens Bros. 1,749 0 0
Callender's Cable and Construction
Co., Ltd. 1,725 3 6
Western Electric 1,720 0 0
Glover's, W. T., Manchester ... 1,691 9 3
Johnson & Phillips, Charlton ... 1,670 0 0
Heny's, W. T., London 1,655 0 0
British Insulated and Helsby
Cables, Ltd., Prescott, Lancs* ... 1,588 7 10
* Accepted.

BUCKFAST.—For the laying of 408yds. of 3in. cast-iron water main in Grange-road, Buckfast, for the Buckfastleigh Urban District Council. Mr. W. J. Goode, surveyor:—
Petherbridge and Sons, Buck-
fastleigh (accepted) £140 0 0

CAMBRIDGE.—For painting the exterior and interior of the pumping station, for the corporation:—
Scott, W., and Sons, James-st. 492 3 9
(Accepted.)

CAPEL, MID KENT.—For the rebuilding of Five Oaks Bridge, Capel, near Tonbridge, for the Kent County Council:—
Middleton, W., Peckham Bush,
Tonbridge (accepted) £192 10 0

CHARTHAM.—For building, at the county lunatic asylum at Chartham, a new bakery, for the Kent County Council:—
Elliott, Reginald, and Co.,
Margate (accepted) £1,100 0 0

CHELSEFIELD.—For carrying out repairs at council school, Chelsheld, for the Kent Education Committee. Mr. W. H. Robinson, M.S.A., Sessions House, Maidstone, architect:—
Baugh, W. E. £105 0 0
Peaster, M., and Son 105 0 0
Smith, J. 96 0 0
Knight, F. J. 93 0 0
Taylor, W. R. 75 0 0
* Provisionally accepted.

CUNTON.—For summer repairs to Cuxton Council School, for the Kent Education Committee. Mr. W. H. Robinson, M.S.A., Sessions House, Maidstone, architect:—
Norman, E. £108 0 0
Brown, E. W. and G. 102 2 6
Swain and Stanley* 89 11 0
* Provisionally accepted.

CONWAY.—For provision of cooking and hot-water apparatus, for the board of guardians:—
Killick and Cochran (accepted) ... 4640 0 0

DARTFORD.—For carrying out summer repairs at council school, Westhill, for the Kent Education Committee. Mr. W. H. Robinson, M.S.A., Sessions House, Maidstone, architect:—
Beaven, E. E. £395 0 0
Bayliss, W. 373 1 0
Knight, T. 359 0 0
Blay, W. F., Ltd.* 328 0 0
* Provisionally accepted.

DEWSBURY.—For a hot-water installation, for the joint hospital board:—
Milan, Huddersfield (accepted) ... £180 0 0

DONCASTER.—For extensions and alterations to the Hyde Park Council schools, for the education committee:—
Boncher and Pearson, Doncaster 4400 7 11
(Accepted.)

DULWICH.—For the erection of a house in Overhill-road. Mr. E. H. Chandler, architect:—
Cook, H. J., & Sons, Green-lane,
Penge (accepted) £470 0 0

FARNBOROUGH.—For erecting bungalow at Farnborough Park, for Mr. T. W. K. Clarke. Mr. A. H. Dunsay, M.S.A., M.R.San I., Alpha Chambers, Alexandra-road, S. Farnborough, Hants, architect:—
Seward, J. B., Wokingham ... £827 0 0
Ewins, E., Farnborough 678 10 0
Smith, T. G., Farnborough ... 616 0 0
King, W. W., Camberley 600 0 0
Hoskins and Jacob, Camberley... 532 18 6
Love, R., and Co., Sunninghill ... 524 0 0
Bundey, W., Farnborough* ... 522 0 0
Jones Bros. Farnborough* ... 518 0 0
* Accepted. † Received too late for inclusion.

FINCHLEY.—For erection of workmen's dwellings, for the urban district council:—
Markham and Markham £35,435 0 0
Street and Herbert 35,235 10 0
Bosworth and Lowe 28,200 0 0
Rowley Bros. 26,666 0 0
Reader, T. and J. R. 26,500 0 0
Gibson and Sons 26,421 0 0
Bolton and Norris 23,183 0 0
Monk, A. 22,350 0 0
Consideration deferred.

FOCHRIN.—For erection of a new council school, for the Glamorgan County Council. Mr. D. Pugh-Jones, F.S.I., Cardiff, county architect:—
Hamilton & Millard, Caerphilly £4,202 0 0
(Accepted.)

FONEST TOWN.—For erection of a school, for the Notts Education Committee:—
Greenwood, J., Mansfield... .. £2,633 0 0
(Recommended for acceptance.)

GAINSBOROUGH.—For additions to the council school, Roper-road, for the Lindsey County Council Education Committee:—
Elms, Gainsborough (accepted) ... £1,735 14 11

GLOUCESTER.—For laundry extension at the work-house, for the guardians:—
Builders' Work:—
Jones, W., Gloucester (accepted) 4875 0 0

GRANTHAM.—For erection of two workmen's cottages in Belton-lane, for the corporation:—
Read, F. (accepted) £385 0 0

GREAT YARMOUTH.—For building a new council school at Newtown, for the corporation:—
Harman, J. D. (accepted) £11,530 0 0

GUILDFORD.—For works at the new borehole, for the corporation:—
Tribe and Robinson (accepted) ... £97 15 0

GUILDFORD.—For erection of 20 cottages in Old Farm-road, for the corporation:—
Higgs, T., Northampton (accepted) £4,119 0 0

HARLECH.—For repairs to Pencraig Cottage, for the Merionethshire County Council:—
Roberts, M. (accepted) £216 0 0

HARROW.—For sewer construction from Kenton-road to Sheeppote-road, for the urban district council:—
Willis and Powis, Wembley ... £341 3 0
(Accepted.)

HASTINGS.—For supply and erection of the extended promenade at the shore end of the pier, for the corporation:—
Braithwaite and Kirk, Lime-
street, E.C. (accepted) £16,000 0 0

HASTINGS.—For the supply of 2,000 tons of broken granite, for the corporation:—
St. Keverne Stone Co., Helston, 13s. 6d. per ton.
(Accepted.)

HEMEL HEMPSTEAD.—For erecting a block of six cottages, for Mr. P. T. Atkinson. Mr. G. Harvey, Hemel Hempstead, architect:—
Sears, W. W., Hemel Hempstead £1,381 0 0
Harrowell, Chesham 1,314 0 0
Payne Bros., Garston, Watford... 1,297 0 0
Timberlake, King's Langley ... 1,215 0 0
Higgs, Northampton 1,196 0 0
Halse, King's Langley 1,179 0 0
None finally accepted. Architect's estimate, £1,160.

HENDON.—For painting and repairs at the infirmary and clerk's offices, for the guardians:—
Hollowell (accepted) £115 15 0

HERNE BAY.—For works at the council school, for the Kent County Council:—
Chase, C. (accepted) £224 0 0

HOVE.—For street works in Holland-road, for the corporation:—
Parsons, J., and Sons (accepted) £359 0 9

INCE.—For the supply of 200 tons of granite setts, for the urban district council:—
Brooks, Ltd. (accepted).

CONTRACTS AND THE WAR.

Our long peace in Europe of just 100 years since the struggle with Napoleon has made us forget all about the trouble that war may bring to us in business matters. Now that Fleets are in our narrow seas, and our coasts are guarded, and soldiers are everywhere, we realise that war is in our midst, and that the State of War must come into our commercial dealings. As regards building and the building trades generally, the thing is not so serious. Most of these matters will go on as usual, at all events so long as we escape actual invasion, which we are fairly certain to do. It is in reference to foreign trade and shipping that the war might make havoc, though even there it may not be so bad as might have been expected. But there are certain legal principles as to our trade position in regard to alien enemies, which, after being so long forgotten, now suddenly become practically applicable. The London Chamber of Commerce has appointed an expert committee, which has issued a circular, Aug. 15, on matters affecting trade and the effect of the war on business transactions, giving advice and information thereon. (*Times*, Aug. 17.)

Primarily, the making of contracts with an alien enemy is illegal while a state of war lasts. The basis of this rule is that we should do nothing which can be of advantage to the enemies of the country. On the other hand, it is quite lawful to trade with such if they are licensed by his Majesty to carry out business dealings. Beyond this it appears to be clear that if alien enemies are allowed to remain in this country, contracts with them in the ordinary way of business, involving no extensive operations which might lead to conflicts of national duty, are probably permissible. In business life most people will settle this point for themselves, and trade or go on trading with alien enemies carrying on business here as they may find expedient. With regard to foreign trade, our merchants who get their goods from abroad will doubtless find difficulties settling themselves in the form of questions as to prices, war risk, and the rate of insurance under Lloyd's policies—points upon which we cannot enter now, but which will be dealt with by those closely concerned in shipping and the like. The whole commerce of the world has been shaken by the war, but is somehow getting itself done notwithstanding. When we come to the performance of an existing contract and the payment thereunder, other considerations arise. Where money was owing by British traders to alien enemies at the outbreak of the war, it may be said generally that it should not be

paid until the war is over. Meanwhile, strictly speaking, payment would be illegal, as tending to assist our enemies. In short, while the war lasts, the carrying out and completion of contracts may be regarded as suspended. Certainly they cannot be practically enforced, either through British or foreign courts of law, quite apart from their illegality. Even where foreign or other bills have been drawn for money due upon contracts entered into before the war, and these are presented while it is proceeding, it seems clear that they should not be paid. This rule would apparently apply, although these bills were presented by British agents, because, either way, the money might be used for the enemy to our disadvantage. But although this is so theoretically, it may often become a question for individual traders whether or not they would do better to pay and so maintain their credit for future use. In reference to bills given in the ordinary course of business dealings at home, although with alien enemies trading here, it becomes still more a matter of discretion and expediency. The enforcing of such payments through our courts, however, would certainly present some difficulties if it were attempted. At all events, except where such dealings were, expressly or inferentially, with licensed aliens.

As to the completion of contracts existing when the war began, with others than alien enemies, cases may arise where this has become, in fact, impossible. For example, in regard to goods coming from abroad, their delivery may be prevented, and a contractor be unable to get the work done in the agreed time, or perhaps at all, for want of the materials required, such as marble, or a special stone, or timber as specified. If communication abroad, and especially with an enemy's country, is cut off, and the carrying out of the contract is thus rendered physically impossible, the contractor should not be held liable. Indeed, this would seem to come within the class of what are known as the "Coronation Cases," where the performance of contracts became legally impossible owing to the sudden illness of the King, Edward VII. Claims of that kind were adjusted upon the basis that agreements could not be completed owing to the happening of an event unforeseen and beyond the control of the parties. So it is believed that where the war interferes with and makes impossible the carrying out of a contract as to building in regard to time or otherwise, the contractor would be excused. But the whole subject is one of much difficulty, and in this country there are few authorities or precedents by which

we can be guided. Then again the form of each agreement and the facts of each case would have to be construed and considered. It is indeed possible that when the war is over there will be some litigation as to the rights and liabilities of the parties, which will then have to be ascertained by the practical application of rules and legal principles which, so far, are now mainly theoretical.

On the whole, it cannot be said that the present state of war necessarily cancels all contracts already entered into with alien enemies. But if performance is impossible, that would amount to a release, at least while the war continues. It is not likely that the building trade will be much affected by the state of war directly as to their contracts, although, of course, it may be very bad for business generally. The erection of buildings under contract in the United Kingdom should not be interfered with by the war, unless in the way of the supply of material coming from abroad, or possibly in a shortage of men owing to so many Territorials being called away for active service. In cases of this kind there may be delay, and something might depend upon the wording of the contract as to liability. War is so rare an event in this country that provision is not usually made for the risk of its occurrence, as is done with regard to strikes, by means of a special clause. But if the evidence proved, as a fact, that the war was the effective, though possibly the indirect, cause of the delay, we doubt if such a breach would even legally carry a liability for damages, which few judges or juries would be found willing to award in fact.

With regard to building and engineering contracts to be carried out abroad, some larger questions might arise. If these were to be completed in an enemy's country, they would practically become void by reason of the state of war itself. Even those in neutral territory would be suspended while the war continued if communication was cut off, or if from any other cause the doing of the work became impossible. Indeed, a state of war, while it may not actually make void all contracts with alien enemies, or in an enemy's country, does so practically, at least, for the period while the war lasts. The indirect effects of the war upon home contracts would depend for their legal bearing upon all the facts of each case. Where alien enemies in the United Kingdom have contracts with British traders to be carried out here their performance is strictly suspended during the war. They would not be enforceable at law; but in many cases it may be to our advantage that they should be completed. Doubtless in that

event this will be done, as it is certainly to our benefit that business should be carried on as usual. Probably in such cases it will be necessary to make special terms as to payment owing to the uncertainty of liability.

The Timber Trade Federation of the United Kingdom, which is much concerned with the foreign trade, recently passed a resolution, "That the Government be petitioned to declare that all payment for wood goods bought from ports north or east of the Hook of Holland, viz.: Russia, Finland, Sweden, Norway, and which are not loaded, be suspended until the end of the war." These countries are friendly or neutral, and so they would not come in under the law which stops all payment under contract with alien enemies. In fact, this resolution asks for a moratorium in the timber trade as regards money owing to foreign friendly or neutral firms. Possibly some declaration of this kind will be made. But it would doubtless have to be one extending to all other similar trades in the same area. The Federation further resolved, "That it is undesirable that the present terms and system of credit in the wood trade, should be unreasonably curtailed." This is certainly sound sense and is really the application of what should be our main motto, "Business as usual," to which we can afterwards add, during alterations to or extension of premises, as may happen. Assuredly reasonable credit must be maintained as far as is possible between all parties to every commercial transaction from the top to the bottom, or there will be collapse and general disaster. In fact this short and sensible resolution applies to many trades and business in the country. We all depend upon one another to make a common profit out of our work and industry. Although divided into classes as manufacturers, merchants, dealers, and retailers, we are still a great nation of shopkeepers, kept together by that business knowledge and confidence which is shortly known as "Credit," and is the basis of trade and livelihood.

THE ROYAL PHOTOGRAPHIC SOCIETY'S EXHIBITION.

The fifty-ninth annual exhibition of the Royal Photographic Society, which opened on Monday at the Gallery of the Royal Society of British Artists in Suffolk-street, Haymarket, and will remain on view until Saturday, October 3, comprises a more numerous collection than has been seen of recent years, although we miss the work of some members hitherto very active workers. The general standard is high, and the eccentricities sent in several recent years seem to have been wisely excluded by the selecting and hanging committee.

About 800 exhibits have been hung, in addition to those shown in a separate section by trade firms. In consequence of the closing of foreign ports by the war, there is a marked falling off in the works by Continental amateurs; but this is compensated for by the brilliant examples shown in the American invitation collection displayed in the north-eastern room. A poetic rendering of a river bend is No. 4—one of five sent by Edward Dickson, of Newark, N.J., and next to it is No. 5, where boats in the still water of a New Jersey fiord show up against a precipitous bank. The best of the five seascapes shown as multiple platinum prints by Karl Struss, of New York, is No. 11, "Near Anahli." The same worker's "East Side, New York," would delight the heart of Mr. Joseph Pennell, for it is a veritable exposition of "The Wonder of Work," pictorially rendered, four tall, circular steel chimneys, all emitting trails of smoke,

stand up over the riverside against a background of skyscrapers; the outlines are so contrasted as to produce a pleasing effect. No. 16, "Twilight on the Beach," by Herbert Wheaton Congdon, of Brooklyn, is a dexterous rendering of a flat coast and shimmering sea. A surf and snow landscape is "Winter," No. 22, by George H. Seeley, of Stockbridge, Mass. In No. 31, "Portrait of a Child," by Francesca Bostwick, of New York, the reflections of a netted curtain on the face and white dress impair the effect. Near by is another work by a lady, No. 37, "The Kittens' Party," by Miss Ema Spencer, of Newark, Ohio; a chubby boy of three is pouring milk into one of a circle of saucers, all differing in pattern; the guests have not yet arrived. Alvin Langdon Coburn, now of Hammondsmith, sends a remarkable series of five photographs of three- and four-masted clippers under sail, No. 52 to 56. Perhaps the finest of these is No. 54, "In Her Stride," in which a four-master is bearing towards us, on the starboard tack, with topsails and flying jib set, bellied out by a stiff breeze; No. 56, "Braced Sharp Up," is coming towards us, bows on. No. 64, "Lower New York," by Richard M. Coit, of Brooklyn, shows the sharp angle of a many-storied business house; the treatment of the terminal tower and spire provides a satisfactory sky-line. "Julius Cæsar Augustus," No. 81, by F. Holland Day, of Norwood, Mass., depicts in clear definition the head and shoulders of a full-blooded negro lad, and the tone contrasts, pose, and accessories contribute to make up an artistic portrait.

The central hall is well and not too closely hung, and contains the pick of the year's work by our leading amateur photographers. A striking and characteristic portrait is that of Mr. W. L. F. Wastell, member of council, a bromide by Halksworth Wheeler, No. 83, and next to it, No. 84, is a new rendering of a favourite subject from the West Sussex Downs, "Fittleworth Mill," midway between Pulborough and Petworth, also a bromide. In the same medium is "The Approach to Middleburg Abbey," a brilliantly-lighted courtyard enclosed by brick buildings, of the usual seventeenth-century Dutch character. It is by D. de Jongh; another, and less successful treatment of the same subject is No. 201, a bromide by George B. Clifton. Three new platinotype interiors of "Westminster Abbey," by Frederick H. Evans, are among the finest of the architectural exhibits, and are masterly in their detail and management of light and shade: "Henry the Seventh's Chapel," is a view from the Confessor's Chapel, looking across the north ambulatory to N.W.; No. 90, "Henry the Seventh's Chapel," is taken from the bronze gates at the entrance, and shows early sixteenth-century stalls and their misereres, and the new and garish emblazoned silken banners of the Knights of the Bath overhanging them; the third view, No. 92, shows the comparatively Late Purbeck marble clustered piers between the nave and its south aisle, taken from near the west end of the aisle. Another platinotype, also by F. H. Evans, is No. 93, "A Mountain Shoulder," and depicts the large, rounded mass of broken stone, Great Gable, as seen from below near Wastwater, over a dry wall of masonry that gives scale to the picture. Next to it is No. 94, "Below Bridge," a bromide of the Pool; a tug has just drawn a string of barges between the uplifted cantilevers of the Tower Bridge. No. 96, "In the Dock: Evening," another riverside subject in bromide, by C. Mackford Hamilton, depicts the imposing masses of the Mersey Offices and Royal Liver Buildings. Of quite another order is No. 97, the flat, marshland solitude of "Walterswick," looking towards South-

wold, by R. Dixey. "The Old Mill," by T. H. Greenall, No. 100, is also a desolate scene; the white cone of a dismantled and sailless windmill stands up across the rank grass of the marshes. "The Swan," sailing with partially upraised wings along a stream, No. 108, a bromide, by E. T. Holding, is effective in its contrasts of soft white plumage and rippled water. No. 109, "Meditation," by James Shaw, is a girl seated on the steps of a north-eastern chapel in a cathedral. The process, vellum-platinotype, lends itself well to the subject. Under the too ambitious title, "Nature in All Her Glory Dressed," No. 111, by F. Humpherson, shows in a carbon print a couple of elms in August foliage on the curving bank of a river slowly flowing towards us. No. 113, "The Beach, Staithes," by Herbert Bairstow, is a bird's-eye of that picturesque and odoriferous Cleveland fishing-village; children are playing on the steep foreshore under the cliffs, and the deep shadows of the protective piles and boards driven into the shingle provide an excellent foreground. A storm-tossed seascape on a rockbound coast is depicted in "Wind versus Tide," No. 114, a bromide by W. C. S. Fergusson. No. 116, "Midnight," is a view of St. Paul's from across the Thames at Bankside, a carbon by Basil Schön. Five Chinese subjects are portrayed by Horace Jackson; No. 119, "A Street in Peking," in oil, shows a narrow, unpaved lane, with shops and projecting signboards and overhanging stories of dilapidated cottages calculated to fill any district surveyor or sanitary inspector with indignation and despair; every conceivable building and health regulation seems to be contravened. No. 120, "My Little Son," a platinotype by the same worker, is a pleasing portrait of a proud Chinese father in pigtail and silk jacket, holding up in his arms, and obviously admiring, a bouncing twelve-months' old boy—the likeness in features of the two generations is very marked. No. 124, "Dinant," by B. E. Stacey, is just now of topical interest, it illustrates from across the River Meuse the picturesque range of houses and the twin Western towers and north side of the thirteenth-century cruciform church against the inland cliff above. "The Seven Sisters," the green-capped chalk cliffs between Seaford and Beachy Head, are shown, apparently from the deck of a Newhaven and Dieppe turbine steambot, in an excellent bromide by William Rawlings, No. 130. A number of reproductions from old portrait negatives, by David Octavius Hill, are of considerable interest, especially No. 134, that of William Henning, the sculptor, and No. 139, of John Ruskin, apparently, if we may judge by the check trousers and swallow-tail coat, dating from about 1860. A still more valuable series of a dozen old photographs are those of Old Edinburgh, made in 1854 by Dr. Thomas Keith, and just printed by Alvin L. Coburn; they show some narrow wynds and closes off the Canongate, now happily swept away, and a tomb in Greyfriars Churchyard, having against it a board inscribed "For Sale." The tomb is of considerable architectural pretensions, having an entablature carried by passable Corinthian columns, and above a shield bearing a coat-of-arms. "The Old Harbour, Hull," No. 145, a bromide transfer, is an admirable example of the work of Fred Judge, of Hastings. No. 146, "From Norman Days," is the rich Transitional Norman doorway at the east end of St. Katherine's Chapel, Ely Cathedral, and is a bromide by R. H. Lawton. "An Impression at Peterborough," No. 148, by Miss Jessie F. Harvey, shows the south choir aisle of that cathedral. "The Staircase, Ashburnham House," No. 152, is a clever rendering in bromide of a difficult architectural subject, by A. Halcrow Verstage.

A.R.I.B.A., the district surveyor for Sydenham, well remembered as a former Cates prizeman and Godwin bursar in his student days. "Sunrise on the Aig Verte," No. 154, by Roland Gorbald, shows from below a dome rock partially veiled in snow. "Le Charron," No. 158, a bromoil, by George B. Clifton, shows a wheelwright kneeling at his craft. One of the most charming child studies is No. 161, by W. Harold House, "Baby Sister," a small boy gazing at an infant, both children in white. A number of stolid and homely Saxon maidens and hobbledeboys set in hillside landscapes are the gum-bichromates, Nos. 162-6, by Hugo Erfurth, of Dresden. An impressionist treatment of the well-known "Sta Maria della Salute" is No. 168, by Dr. J. Ruzicka; the cupola of the great church is seen across the lagoon, over a foreground of gondolas and a fishing-boat. There are, as usual, several illustrations of Rotherburg: No. 170 is a gum-bichromate, by Albert Meyer, of the market-place of that picturesque city, and No. 184, by Albert Gottheil, shows one of the lesser gateways. "Ants" is the suggestive title of No. 173, one of several street scenes in New York by John Wallace Gillies; this one is a bird's-eye from a lofty office building of a busy street reduced in apparent width to an alley by the high-soaring buildings on either side. An equally effective view, by the same photographer, also from a high level, is that looking down on "Brooklyn Bridge," No. 174. In "The Way Through the Fields," No. 202, by Charles F. Inston, a peasant-girl is walking on the edge of barley ready for the reaping-machine. "The Beguinaige at Bruges," No. 205, is a well-worn subject, here luminously portrayed in carbon by Thomas H. B. Scott; and yet another study from Bruges is No. 227, by B. E. Stacey, illustrating one of the numberless canal bridges. Alvin L. Coburn depicts for us in a platinum, No. 212, "Frank Brangwyn, A.R.A.," the president of the Royal Society of British Artists, at work upon a figure study in fresco. A recent visit to Northern Italy is admirably perpetuated by John H. Gear, in "Les Iles Borromées," No. 220, looking across Maggiore towards the mountains behind Baveno; and in 221, "Venezia," No. 222, a platinotype, by J. R. H. Weaver, is a view in the south aisle of Segovia Cathedral, so characteristic an example of the sixteenth-century Renaissance of Northern Spain. Close by these exhibits a series of half a dozen works by Frank H. Read, notably Nos. 230 and 232, "Thames Wharves," and "Birches by a Mountain Lake," have almost the richness, artistic effect, and finish of mezzotints. Three bromide views across the Thames in London, by J. Dudley Johnston, are hung together: No. 242, "Somerset House," with the level lines of the western parapet of Waterloo Bridge as a foreground; No. 244, "St. Paul's," from the same viewpoint; and No. 243, "Westminster," in which, looking across from Lambeth Pier, the Victoria Tower of the House, the south side of the Abbey, and Lanchester's square Wesleyan Hall dome appear across the river, with the old and new Embankments and gardens as a defining line. In "An Alsatian Farm," No. 248, by Bertram C. Wickison, a half-timbered homestead is visible beyond a squalid and ill-kept courtyard. "The Transept, York Minster," No. 251, by G. T. J. Walford, is a platinum print taken in the south transept looking south-east. A problem-picture is attempted by J. B. E. Wellington, in No. 251, "The Letter," where a middle-aged man, standing near the refreshment counter in a ballroom, thrusts an open letter into the hands of a girl in décolleté dress; but the poses are forced. No. 264, "The Suppliant," by William Archer Clark, has as its subject a peasant-woman before an altar. No. 260,

by J. C. Warburg, shows "The Forth Bridge" in sharp perspective on the left, looking across to the East Fife coast, and another good subject in this gallery is No. 290, "Loch Achray," by G. T. J. Walford. In Section III. are displayed a number of scientific and technical photographs, including negatives and prints of spectra of Rontgen rays, for which a medal has been awarded by the Council to the Duc de Broglie, fresh demonstrations, by A. E. Bawtree, of the insecurity of dependence for the protection of banknotes from forgery by printing in yellow tones, and a fresh method of protection devised by the same worker, in which a hidden design is incorporated in the printing of the document, and can only be seen by means of a special screen in the possession of the banker. There are also astronomical photographs from the Yerkes and Mount Wilson Observatories, and others of insects, birds, reptiles, and plants. A large number of transparencies in colour and monochrome are exhibited; but all are by one of the three well-known processes, the Autochrome, the Dufay, and Paget methods—and show but little technical advance on those exhibited in recent years. The only novel exhibits are the photographs in natural colour on paper by the Polychromide process, and printed without the use of inks, dyes, or any artificial colouring. The colours are formed by chemical reactions in the gelatino-silver emulsions, and are at present crude and startling in effect. There is also a series of colour-prints executed by Frederick Hollyer from water-colours by Turner, Corot, and Monet; these certainly give a close approximation to the original works, but they are by no means inexpensive; in fact, they would exceed in cost the work of most well-skilled copyists. Some interesting carbon- and oil-pigment prints done at the School of Pictorial and Technical Photography, under the tuition of John H. Gear, the principal, are hung in the entrance-room. As in previous years, a series of popular lectures, illustrated by lantern views, is being delivered in the main gallery on three nights a week, commencing at 8.30. The programme is as follows: Saturday, August 29 (to-morrow).—"Birds of Loch and Moor." By Miss E. L. Turner. Tuesday, September 1.—"Through Birdland with a Camera," and gramophone records of the songs of the nightingale. By Oliver G. Pike, F.Z.S. Thursday, September 3.—"Life on the Lower Deck of a Dreadnought." By H. Nevil Smart. Saturday, September 5.—"St. Paul's Cathedral." Tuesday, September 8.—"In the Western Highlands." By G. Lamley, F.R.G.S. Thursday, September 10.—"Spore Dispersal by Past and Present." By F. J. Hall. Saturday, September 12.—"Rambles in Donegal." By H. Selby. Tuesday, September 15.—"Stalking African Big Game with the Camera." By A. Radcliffe Dugmore, F.R.G.S. Thursday, September 17.—"A Short Sketch of Gothic Architecture." By Henry W. Bennett, F.R.P.S. Saturday, September 19.—"Wild and Garden Flowers," illustrated with autochrome slides. By H. Essenhigh Corke, F.R.H.S. Tuesday, September 22.—"A Mercian Minster and Its Memorials." By E. W. Harvey Piper. Thursday, September 24.—"The King's Highway." By A. H. Blake, M.A. Saturday, September 26.—"X-Rays, What They Are, and What They Do." By Dr. G. H. Rodman. Tuesday, September 29.—"Wonders of Rock and Pool." By F. Martin-Duncan, F.R.M.S. Thursday, October 1.—"Algeria." By C. Atkin Swan, B.A. Saturday, October 3.—"The Romance of Bird Life." By W. Bickerton, F.Z.S. Mr. A. W. Brightmore, inspector under the Local Government Board, has held an inquiry at Penzance respecting an application by the Burial Board for a loan of £2,000 to enlarge the cemetery.

THE PRACTICAL APPLICATION OF REINFORCED - CONCRETE CONSTRUCTION.—III.
By WM. G. SHIPWRIGHT, Licentiate R.I.B.A., M.C.I., Chartered Surveyor (by Exam.)
The point at which reinforced concrete stands at a great disadvantage as compared with the old type of steel joist and concrete floor section is in the facility with which the latter may be applied. A reference to the manufacturers' lists, combined with a calculation of the total load, does all that is required, or if this calculation process is not desired, a reference to the diagrams published some time back in the BUILDING NEWS, will show at a glance the suitable sections for any given superficial load and area of floor.
Reinforced-concrete design is, however, another matter entirely; no lists are published, or, for that matter, even possible, when it is considered that every fractional part of an inch in the spacing or depth of the rods in the floor produces different capacities of resistance, resulting, in conjunction with the innumerable available sections of metal, in an infinity of gradations in strength, which entirely prevent anything approaching an effective tabulation. The designer has, therefore, to calculate each unit of the structure separately, which, assuming he has become fully acquainted with the somewhat involved reasonings and deductions, he will do by first tackling the formulæ
$$u = \sqrt{m^2 r^2 + 2mr} - mr$$
as a preliminary measure, in order to determine the position of the neutral axis.
Taking an example for the purposes of illustration, and assuming that a floor slab with a span of 12ft. has to carry 100lb. superimposed load per foot. The weight of the floor varies according to the thickness, so for a hazard assume that a 5in. floor will be the depth, and again at a hazard assume that five 5/16in. rods will be required. The weight of the floor will be 5/12 × 12 × 5 × 1.1. (If tables showing the weight of rods are available) = 46 2/3 + 5 1/2 = approximately 52lb., making a total weight of 152lb. per foot super. Proceeding from this, we find that, based on the accepted formulæ, the neutral axis may be found by the following expeditious and facile process of calculation—viz., the distance of the neutral axis from the compressed edge equals the square root of the sum of the modular ratio of elasticity of steel and concrete, multiplied by the ratio of their respective areas, and twice those areas from which result is deducted the product of these two figures. Thus—
$$n = \left[\frac{\text{mod. ratio} (15)^2 \times \text{area ratio}^2 + 2mr - mr}{d} \right]^{1/2}$$
The area ratio (r) = $\frac{2 \times \frac{5}{16} \times 1.1 \times 7861 \times 5}{12 \times 5} = \frac{1.5}{60.0} = .025$ approx.
or 2 1/2 per cent. Including this and the various constants, the formulæ become
$$N = \sqrt{15^2 \times .025^2 + 2 \times 15 \times .025 - 5 \times .025} \times 5$$
$$= \sqrt{225 \times .000625 + 30 \times .025 - .375} \times 5$$
$$= \sqrt{14.0625 - .75 - .375} \times 5$$
$$= \sqrt{12.9375} \times 5 = (3.59 - .375) \times 5$$
$$= 3.215 \times 5 = 16.075$$
The figures illustrated, which omit all the workings of the multiplication and division, including a long square-root process, make a tolerably good start, and after arriving at this conclusion we find that the next step is to determine the lever arm between resistances, by taking the total depth and subtracting from it
$$\frac{n}{3} \text{ or } \frac{5 - 2.81}{3} = 5 - .946 \text{ or } 4.054 \text{ in. approx.}$$
Then the tensile resistance equals area of metal × 4.05 permissible tensile working stress, and the compressive resistance equals area of concrete × 1.05 permissible compressive working stress,
$$= 1.5 \times 4.05 \times 16,000 = 97,200 \text{ in. lb.,}$$

SCALE OF PERCENTAGE FOR VARYING SIZES AND NUMBERS OF RODS
IN VARYING THICKNESS OF SLAB.

DIAGRAM FOR REINFORCED CONCRETE FLOORS.

Showing sections required for loads from 10 to 1250 lbs. per super foot (inclusive).—

SAFE LOADS PER SUPER FOOT
(INCLUSIVE) CONCRETE 600 LBS
STRESS PER SQUARE INCH 1000 LBS
SUPPORTED ENDS REINFORCED ONE WAY ONLY
CONTINUOUS REINFORCED IN BOTH DIRECTIONS
SUPPORT ENDS CONTINUOUS

and—
 $12 \times 2.84 \times 4.05 \times 600 = 41,407.21b.$, respectively,
 which is in itself an evidence of wastage in the steel. The bending moment should be based on the formulae

$$w l^2, \text{ and } = \frac{12 \cdot 152 \times (12 \cdot 12)}{8} = 32,832lb,$$

being less than either resistance, showing that the assumption proves to work only moderately near the mark. The whole calculation, from the very start, has to be gone through again and again, until a suitable section has been secured—a truly stupendous task. In the case illustrated we should find, after repeated calculations, that a 5in. floor with 1.3 per cent. (.013 ratio) reinforcement would be suitable. This would be approximately secured by six 3/4in., four 1/2in., or three 3/8in. bars in each foot-run, which would mean a very sensible reduction on the previous calculation.

For this reason it appears eminently desirable to secure some diagrammatic form which will enable the required section of floor to be determined on inspection, and with this object in view I have designed the diagram shown in Fig. 26, which shows any floor loading from 10lb. to 500lb. per foot super, for spans up to 20ft. The combination of these loads, whether on supported slabs continuous floors reinforced one or both ways, gives resulting moments graduating from nil up to 300,000 inch-lb., and are shown on the left side of the diagram. These resultant lines cross the lines of thickness of floor slab, and incidentally show the maximum capacity in resisting the bending moment which each slab possesses, as, for instance, the 4in. floor maximum (10 per cent. reinforcement) equals about 33,000 inch-lb., the 4 1/2in. about 42,000 inch-lb. The 12in. slab has a maximum of 300,000 inch-lb. and a minimum of about 120,000 (.05 per cent. reinforcement).

On the right-hand side of the diagram is shown what is virtually the other side of the scale to the bending moments, or, in other words, the moment of resistance. It will be seen that a series of rods ranging from 3/4in. to 1in. both square and round, from 1 to 8 per foot are graduated on polar lines, representing floor thickness. The diagonals show the percentages given by the various rods on different thickness of floor (from 4in. to 12in.). The corresponding ratio is also given, varying respectively from .005 to .1 (.5 to 10 per cent.). The minimum ratio of metal to concrete should be ordinarily just above .006, and this percentage is shown with a thick black line. These ratios or percentages give varying positions of the neutral axis, according to their value, and these positions of the axis are shown by the positions where the vertical lines representing the percentages cut the curved lines M8, M11, and M15, representing the respective values of the concrete, composed of—

1 cement	2 sand	4 coarse material	M = 15
1 "	1 1/2 "	3 "	M = 11
1 "	1 "	2 "	M = 8

On the right and left are corresponding scales, which show the percentage in the height of the floor which this axis occupies. The position of this axis determines directly the strength of the floor; therefore, the position where the lines representing the height of the axis in the floor intersect the lines of floor thickness, shows the resistance moment produced.

To check the example already quoted of a 5in. floor with five 3/4in. rods as reinforcement over a 12ft. span, with a load of 152lb. We find five 3/4in. rods on 5in. floor gives .025 ratio (2.5 per cent.) reinforcement, which, followed up, gives the position of the neutral axis as = 56 per cent. of the depth from top (M15., giving a moment of just under 42,000 inch-lb., which will be seen to have a value of about 190lb. per foot over 12ft. span, or 40lb. per foot more than is required, looking in the other direction, and taking a load of 150lb. on 12ft. span, we get a moment of something about 33,000 inch-lb., which would demand an axis 45 per cent. of the depth (from top) on a 5in. floor, 57 per cent. on 4 1/2in., about 80 per cent. on a 4in. Following the lines on diagram, it will be seen those floors would

respectively require about .012, .025, and .1 as a ratio of reinforcement. This may be supplied by seven 3/4in. round, six 3/4in. square, four 1/2in. round, three 1/2in. square for the 5in. floor. Seven 3/4in. round, six 1/2in. square, five 3/4in. round, four 1/2in. square, or three 3/4in. round for the 4 1/2in. floor, whilst the 4in. requires as much as seven 3/4in. square or 1in. round, or five 1in. square rods in every foot.

It will be seen that the diagram above shows the thicknesses of floors suitable, and that 5in. is the most economical section. It will be seen that a 6in. floor would be too deep, but a 5 1/2in. would just work on economic lines, with a neutral axis approximately .35 of the depth from the top, a ratio of .006 being adequately supplied by, say, three 3/4in. round bars.

The diagram, in short, shows the capacity of each thickness of floor, and the possible range of floors suitable to each superficial load, with sufficient accuracy for all practical purposes, and, which is more important, the most economical way of arriving at what each individual case requires, without the necessity of innumerable repetitions of

$$u = \sqrt{m^2 r^2 + 2 m r} - m r, \text{ \&c.}$$

[THE END.]

NATIONAL HOUSING.

On Friday morning, August 21, 1914, the President of the Local Government Board received a deputation of representatives of the National Housing and Town Planning Council, including the following members of the committee: Councillor Harold Shawcross, J.P. (chairman, Rochdale), Alderman W. G. Wilkins, J.P. (ex-mayor of Derby), Alderman J. P. Spencer, J.P. (Tynemouth), Councillor T. R. Marr (Manchester), Major C. P. Lovelock (Carshalton), Councillor F. M. Elgood, J.P. (Ruislip-Northwood Urban District Council), Mr. E. R. Abbott (Ruislip-Northwood U.D.C.), Mr. Raymond Unwin, F.R.I.B.A. (Hampstead), Mr. B. Seebohm Rowntree, J.P. (York), Councillor S. Smethurst, J.P. (past-president, Federation of Building Trade Employers), Mr. Albert E. Cave (London), Mr. A. W. Shelton (Nottingham), and Mr. Henry R. Aldridge (secretary).

Mr. Noel Kershaw, assistant secretary, Local Government Board, was also present.

The chairman and secretary briefly introduced the deputation and placed before the President of the Board the following memorandum. The chairman specially emphasised the fact that the members of the committee were unanimously of opinion that the rate of interest for housing loans under the new Act was a point of fundamental importance.

We gladly recognise that the Government, acting through the Local Government Board, wish to do all within their power to stimulate the building of houses by local authorities and by public utility societies during the war period.

We believe this policy to be a wise one for two special reasons:

(1) That the supply of private capital for financing building operations will be greatly restricted during the period, and there may be a great lack of employment in the building trade with consequent distress.

(2) That it will be better to keep the building trade supplied with useful work than to allow conditions of bad trade to arise with all the consequent waste of money on costly and more or less ineffective relief works.

We believe that many local authorities will be willing to take action in regard to the building of houses where a shortage can be shown to exist, and that facilities given by the Government to secure this end will be welcomed and consequent action taken.

Two points are, however, of fundamental importance, viz.:

(a) While recognising the difficulty which the Treasury may have in financing housing schemes at the present time, we are convinced that any proposal which involves the payment of interest by local authorities at a rate higher than was current before the war would meet with little response from them.

(b) The procedure for granting housing loans should be the one familiar to local authorities, viz.: for periods of sixty years for building, and eighty years for land.

We desire to add that, in the opinion of the majority of the members of our committee, it is most important that the Government should stimulate local authorities in undertaking housing schemes by making capital grants in aid of the expenditure upon such schemes. We also suggest that arrangements should be made for the granting of housing loans to public utility societies at rates of interest current before the war during this exceptional period, and that the proportion of the loan to the value of the property should be raised from two thirds to nine-tenths. The Government may, in making these loans in war time, have to make some sacrifices — for example, the difference between the rate at which they can borrow and the rate at which they lend to local authorities. In return we think the Local Government Board should stipulate for several special features in the various housing schemes submitted by local authorities. Thus we would strongly urge that, wherever possible, houses built in urban districts should be built under town-planning conditions with a limitation of houses to the acre of from twelve to sixteen.

We would urge that in rural areas provision should be made for each house having a site area of a quarter of an acre, or that, if it is decided to build on less than this area, in no case should there be more than eight houses to the acre, and that provision should be made for those tenants who wish to obtain extra land for allotments close to their homes. We think that local authorities should also be required to adopt a good standard of housing—for example, the sizes of rooms should not be less than those recommended by the Small Holdings Committee, and three rooms in addition to the living room should be provided. We would press upon the Government the desirability, if this be possible, of allowing such houses to be built with concessions in the width of roads in a simple form of town-planning scheme applicable to the area on which the houses are to be built.

REPLY OF THE PRESIDENT OF THE LOCAL GOVERNMENT BOARD.

Mr. Herbert Samuel, in replying, said that the great interest shown by the Government in the points raised by the deputation, could be seen from the fact that the Government had before adjourning on August 10, passed a Bill providing for the issue of £4,000,000 for the purpose of housing. The Government had, of course, realised that a point of fundamental importance in regard to housing loans under the new Act, was that of the rate of interest for these loans.

A conference to consider this point had been held, at which he had met representatives of the Treasury and of the Public Works Loan Commissioners, the Secretary for Scotland, and other gentlemen advising him in the matter. As a result of this conference, and with the approval of the committee on urban housing recently appointed, he had sent a circular to the local authorities. In this circular he stated that it was the intention of the Government that such sums as might be made available under the new Housing Act should be utilised for the joint purposes of providing and improving housing accommodation for the working classes, and of preventing or mitigating unemployment in the building trades. The Treasury would be prepared, so far as circumstances might permit, to consider advances to local authorities of money for approved schemes of building which would meet the above objects at the rate at which the Government might be able to borrow.

In regard to the proposal that loans should be granted at a fixed rate per cent., say 3, — during the war period, he wished to point out that no one could possibly forecast what the rates of interest would be for several years after the war. Many great nations were consuming capital at the rate of millions of pounds per day, and this would produce a scarcity of capital at the end of

the war. If in addition we had in this country a trade boom, the rate of interest would be high as a result of the great demand for capital.

In closing, Mr. Samuel again expressed his earnest desire to do all that he could possibly do to stimulate housing action by local authorities in this period of national need.

In the discussion which followed Mr. Samuel again made it clear that in cases under the new Housing Act the Government would lend local authorities money at the rate of interest which the Government had to pay, that the money thus lent would be lent for periods of sixty years for building and eighty years for land. He thought that, if at the end of the war period, or at subsequent periods, local authorities could borrow money at lower rates of interest, they would be allowed to use it to extinguish the loans granted during the war period. Mr. Samuel also stated that the Treasury had consented to the granting of loans to public utility societies for nine-tenths of the value of the property, as against the two-thirds provided for in the Act of 1909. The question of the rates of interest to public utility societies and the periods of the loan was, however, still under consideration.

Mr. Unwin and Mr. Shawcross raised points as to the possibility of securing the co-operation of local authorities and public utility societies for the purpose of building. Mr. Samuel promised to consider these fully if Mr. Shawcross and Mr. Unwin would place before him in writing the precise schemes which they had in mind. In regard to the question of the planning of the land to be built on, he had already given consideration to this matter, and he proposed to communicate with local authorities at a later date. It had, however, been thought better not to deal with the question in the circular already issued.

Councillor Marr and Alderman Wilkins raised the question of the possibility of using part of the £4,000,000 provided for in the Housing Act for the purpose of grants in aid.

Mr. Samuel, in replying, stated that it was not the intention of the Government to use this £4,000,000 for the purpose of grants in aid. If they began to do this, every local authority borrowing money would expect to get a grant. Their great aim was to induce local authorities to undertake housing schemes.

THE ARCHITECTS' WAR COMMITTEE. SUPPORT FROM THE SOCIETY OF ARCHITECTS.

The Council of the Society of Architects, at its meeting on August 20, unanimously decided to support the movement initiated by the R.I.B.A., by every means in its power, and to place at the disposal of the Architects' War Committee the Society's premises and staff at Bedford-square, for the use of any of the sub-committees. They further voted a first grant of 100 guineas as a contribution to a fund to be formed for providing paid work for architects whose means of livelihood is stopped by the war, and undertook to appeal to members of the Society and their friends for generous contributions towards this fund. The Council has suggested to the Architects' War Committee that a professional employment sub-committee of that body should be at once formed to deal with the administration of this fund; firstly, in determining those architects in actual need of financial assistance in consequence of the war, and, secondly, in evolving schemes of a useful nature by which these men may be temporarily employed, such, for instance, as offering small fees for measured drawings to be made of buildings of historical and architectural interest, schemes for the improvement of arterial traffic, or town planning improvements, etc., etc. The main object of this sub-committee would be not to distribute benevolent aid, but to enable a man to earn a small weekly sum in such a manner that at the end of the war the community would benefit by the work done.

The copyright of these drawings should belong to the man producing them; but the

original or copies should be deposited with the Architects' War Committee for subsequent exhibition or publication.

The Council further suggested the desirability of a common appeal being made to architects by the Architects' War Committee, but that this appeal should be circularised by each architectural society amongst its own members, with a covering letter of support. The Society of Architects is willing to bear the entire cost of circulating the appeal and collecting the contributions to the fund from its members and their friends.

SALT-GLAZED WARE PIPES.

The Engineering Standards Committee have issued "Notes on Publication No. 65, British Standard Specification for Salt-Glazed Ware Pipes." The desirability of standardising "stoneware," sewer, and drain pipes, was urged upon the committee at different times from various quarters, and more particularly by the Institution of Municipal and County Engineers, which body appointed a committee for the purpose of obtaining information from their members with regard to their requirements for a standard specification. The data thus collected was then summarised by that institution in the form of a draft specification and placed at the disposal of the Engineering Standards Committee. A representative and well attended conference of users and manufacturers was called early in 1911 to consider whether the standardisation of this class of pipe was desirable, and the opinion of the meeting being unanimously in favour of such a proceeding, the main committee formed those attending the conference into a sectional committee under the chairmanship of Sir Maurice Fitzmaurice, C.M.G.

At an early stage of the work it was found desirable to discard the use of the term "stoneware" as being difficult of definition, and to adopt the term "salt-glazed ware," which was sufficiently descriptive of the pipes, the quality being safeguarded by the imposition of an absorption test.

In drawing up their recommendations for salt-glazed ware pipes, the committee were able to avail themselves of the draft standard specification drawn up by the Standardisation Committee of the Institution of Municipal and County Engineers previously referred to, and of a draft specification based on the proposals of that institution which was subsequently submitted by the pipe manufacturers on the sectional committee as the result of a long series of conferences amongst the manufacturers. These drafts were of material assistance in forwarding the work of the committee, and were of very great help in leading up to the formulation of the standard specification forwarded herewith. The question of putting forward a standard form of socket, which would produce in unskilled hands better alignment than the form in most general use, occupied the attention of the committee for some considerable time; but, in view of the importance to the industry of not materially increasing the cost of salt-glazed ware pipes, it was not found practicable to proceed with the matter, and therefore, as regards the sockets, only the minimum mean thickness and minimum internal depth and a minimum jointing space have been specified.

The specification divides the pipes into two classes—namely, British Standard Pipes, which are made with the intention of complying with the specification, but of which only a percentage are required to be submitted to the hydraulic test, and British Standard Tested Pipes, that is to say, pipes which have been individually subjected by the manufacturer to the hydraulic test laid down in the specification. Amongst the other points dealt with are the absorption test, permissible limits of deviation from thickness, standard diameter, and straightness, and a standard mark for all pipes complying with the British Standard specification. The specification is one that should be in the hands of all municipal engineers and architects.

The price of the report is 5s. 2d., post free, and it may be obtained from any bookseller, or direct from the Offices of the Committee, 28, Victoria-street, Westminster. It is published for the committee by Messrs. Crosby, Lockwood and Son, 7, Stationers' Hall-court, Ludgate Hill, E.C.; and 5, Broadway, Westminster.

OBITUARY.

We regret to announce that Mrs. Rosa Cates, widow of the late Mr. Arthur Cates, F.R.I.B.A., died on Wednesday in last week from heart failure, after a short illness, at her residence, 12, York-terrace, Regent's Park. Mr. Cates, who, it will be remembered was for many years surveyor to H.M. Woods and Forests, and was Vice-President of the Royal Institute of British Architects from 1888 till 1892, and acted as chairman of the Board of Examiners from the establishment of the compulsory examination for Associates in 1882 until January, 1897, and as chairman of the Tribunal of Appeal from 1884 till 1901, died on May 15, 1901, in his seventy-third year. Mrs. Cates followed her husband's example in her generous donations to the Institute library of valuable works and an extensive collection of architectural photographs. The memorial service was held at St. Marylebone parish church on Monday morning, and was followed by cremation at Brookwood.

Mr. Arthur Charles Bulmer Booth, A.R.I.B.A., for many years a partner in the late firm of Hudson and Smith, Godliman-street, E.C., died a short time since, aged seventy years. Mr. Booth was a pupil of the late Mr. Joseph Springbolt. Afterwards he entered the office of the late Professor Aitchison, B.A., R.A., as assistant, remaining until he joined Mr. William Hudson. Later he became a partner with Mr. Hudson, jun., the practice being carried on under the title of Hudson, Son, and Booth until the death of Mr. William Hudson. Then it was continued by the remaining partners, and subsequently by Mr. Booth alone, at 113, Queen Victoria-street. The firm has carried out a large amount of important work in the City and suburbs. Just before his death, Mr. Booth had taken into partnership his chief assistant, Mr. G. Morris Viner, by whom the practice will be continued at 113, Queen Victoria-street. Mr. Bulmer Booth was one of the senior members of the Architectural Association, which he joined as long ago as 1863; he took for many years an active interest in its work, and often figured in the cast of the annual plays, and as a tenor singer in musical entertainments. He had been an Associate of the Royal Institute since 1881.

The late Mr. Haynes Bradford, of Clough-villas, Clough-road, Rotherham, of the firm of Messrs. Chadwick and Co., builders and contractors, left £28,007 gross, and net personalty £21,190.

A Roman Catholic Church of Our Lady of Lourdes is to be built at Greencastle, near Killeel, Co. Louth. The architects are Messrs. E. and J. Byrne, of Waring-street, Belfast.

The lady architect is coming to the front under the Southern Cross. The New Zealand Institute of Architects admitted as an Associate at their last general meeting Miss L. A. Greenish of Wellington.

Mr. C. H. Eyles, Local Government Board Inspector, has held an inquiry at Blackwell, Derbyshire, into an application by the rural district council for sanction to borrow £20,000, in order to carry out a housing scheme.

Mr. R. H. Hooper, M.Inst.C.E., has held a Local Government Board inquiry at the Town Hall, Middleton, Lancs, into an application by the council to borrow the sum of £7,610 for extensions at the electricity works. Mr. S. Pauls, the borough electrical engineer, explained the proposals.

Messrs. Hodgson, King, and McPhalen Bros., of Vancouver, B.C., have secured the contract for trunk sewers to be laid in Vancouver to the value of 309,052dol. Mr. Geo. W. Phipps is the engineer of the work, which is in connection with the Vancouver and Districts Joint Sewerage and Drainage Board scheme.

COMPETITIONS.

DECORATIONS OF AUSTRALIA HOUSE.—A competition has been arranged in connection with the mural decorations of the new Commonwealth of Australia building, Australia House, now in course of erection in the Strand and East Aldwych, from the designs of Messrs. A. Marshall Mackenzie and Son, and illustrated in our pages on July 4, 1913. In all twelve paintings are required. The sketches are to depict incidents in Australian history, or features of its scenery or productive activity. The competition is open to all artists born in the Commonwealth, or who have lived there five years and upwards, or who are now resident in Australia. The sketch designs must be forwarded to the High Commissioner's Office, London, not later than January 15, 1915, and will be judged by a committee appointed in London. The winners of the premiums will receive commissions to paint pictures at the following prices: Group I.—Two pictures at £1,100 each; Group II.—Two pictures at £1,200 each; Group III.—One picture at £600, two at £400, and two at £250 each; and Group IV.—One picture at a lower figure.

POTTON.—In the competition for a housing scheme at Potton, Beds., the committee have recommended that the laying-out of the land and erection of houses be carried out from plans prepared by Messrs. Homer and Lucas, architects, 62, Oxford-street, W. The houses are to be according to the design of those prepared by Messrs. Homer and Lucas for Sandy and Beeton, Beds., and which have been approved by the Local Government Board.

SOUTHPORT.—The replies to competitors' questions issued this week in regard to the Competition for Technical Schools at Southport, clear up several important points with respect to the area available for the new premises, and also the rights of light incidental to "Crown House" and "Brunswick Villa," adjacent to the Glaciarium on the land. These points are now more definitely particularised, and, besides, the restrictions belonging to the property leased by Messrs. Kiddie and Co., at the end of the skating-rink hall are also more exactly stated. The problem is materially complicated by all these limitations thus set out, while having to provide for Scheme A at a definite cost of £16,000, including practically the whole of the accommodation mentioned in the schedule, a further consideration hampers the project, inasmuch as some of these rooms may be temporarily housed in the present front block. This block will ultimately, however, give place, under an alternative scheme, B, for an important extension, though no particular sum has been determined with regard to its cost. The comparative estimate of competitors' schemes for the proposal B (other than the initial outlay of 16,000), "will be taken into account by the assessor." This allowance permits of no little uncertainty. Moreover, we learn that "within reason" the competitors may use their discretion as to the number of stories to be employed in order to get the essential provision of all the scheduled accommodation in Scheme A. From the areas so asked for we observe that no serious departure is permissible. This is definite enough, so far, and the available amount of building site is fairly clear; but it remains doubtful whether so hampered a problem can be really a suitable one for an open competition of this character, which includes the rebuilding of the rear part of the Glaciarium, and for adapting the front building, which ultimately will be rebuilt, this intention at the outset making the final arrangement (Scheme B) of the utmost consequence. "If this can be designed so as temporarily to use the front building in a satisfactory manner, such a design will have preference." The competitors are also told that if they "consider it inconsistent with the best arrangement to make Scheme A an instalment of Scheme B" they are "at liberty to submit a Scheme B unrelated to Scheme A." In such a case the schemes A

and B will be virtually alternatives to one another." Mr. Paul Waterhouse, F.R.I.B.A., the assessor, will, therefore, have not a few details as well as general instructions to take into account and bring them into harmony prior to any exact adjudication. If some overmastering scheme should prove to claim a pre-eminence on its merits, such a result will be only possible by ignoring some of these details to which several cross-references occur. Such a multiplicity of conditions will no doubt hamper other competitors who try to bring into unison various conflicting points, as set out in the instructions and official replies. The date for sending in the drawings is October 14 next. The advertisement gave "no date," and we repeated this fact in our competition list, issued from week to week; but when the project was originally mentioned it was understood that plans would be required by the end of the year; consequently we gave the date at the outset as Dec. 31. This was a misconception. Premiums of £75, £50, and £25 are to be awarded.

The Waterford County Council have decided to allow the retiring county surveyor the superannuation he was legally entitled to—viz., two-thirds of his salary.

Mr. H. A. Chapman, an inspector under the Local Government Board, held an inquiry at Harwich on Monday into the application of the town council for sanction to borrow £2,140 for the purchase of land and the erection of working-class dwellings.

Mr. F. H. Tulloch, one of the Local Government Board inspectors, held an inquiry at the town hall, Rochdale, on Thursday in last week, relative to the application of the corporation for sanction to borrow £1,665 for the purchase, fencing, and laying out of a recreation-ground at Spotland.

An emergency Local Government Board inquiry has been held at High Wycombe to consider an application for £11,200 for the erection of 54 workmen's dwellings on land purchased from the Marquis of Lincolnshire for £880. The scheme will facilitate local employment during the war.

The executive council of the Municipal Employees' Association at a special meeting on Saturday unanimously decided to pay the contributions of all the members who have joined the colours, and of those who may volunteer to take part in defence of the country. The decision affects more than 2,000 men.

Mr. R. S. Hetherington, an inspector under the Local Government Board, held an inquiry at the Municipal Offices, Southampton, on Tuesday, into an application by the corporation of that borough for sanction to borrow sums amounting to £36,500 for works of water supply, including the construction of a reservoir in Glen Eyre-road, Bassett, and other works at Otterbourne.

It was reported at the meeting on Tuesday of the Billericay Rural District Council that several claimants had come forward for a house built by an old lady named Mrs. Elizabeth Somerville, who was killed by falling from a tree. The house had been condemned, but the old lady had chased away the inspectors with an axe. Owing to the war, house property would not fetch much if sold, and this house had been valued at 30s.

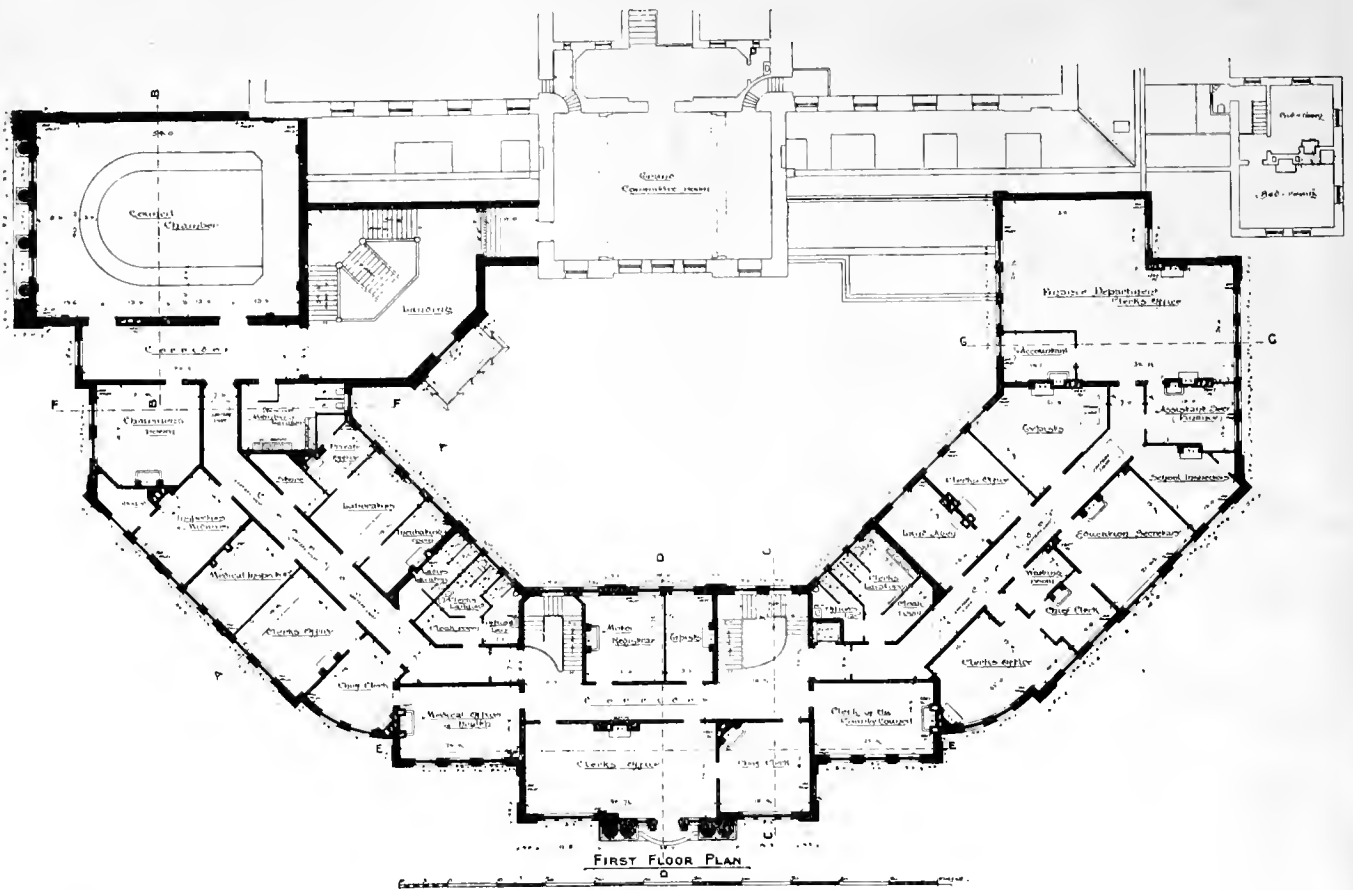

A collection valued at £4,000,000 has been bequeathed to the Louvre by Baron Schlichting, a prominent member of the Russian colony in Paris, who died recently. It comprises pictures, bronzes, objets d'art, and furniture. Among the pictures are some of the finest-known examples of Rubens, Boucher, Fragonard, Nattier, and Watteau. There are 142 snuffboxes, for which the late Mr. J. Pierpont Morgan once offered £480,000. One of them, painted by Fragonard, is alone valued at £20,000.

At the last meeting of the Spalding Rural District Council it was reported that the Local Government Board had written giving sanction for the loans of £523 for purchase of land at Pinchbeck and £3,852 for erecting houses thereon. It was stated that a local firm who held housing contracts under the council were reported to be unable to carry them out on account of financial difficulties, and that the Quinding contractors, Messrs. Johnson and Son and Mr. Thompson, were prepared to take over the firm's contracts at the same prices. This was considered satisfactory, and it was decided to ask the firms named to send in formal tenders.

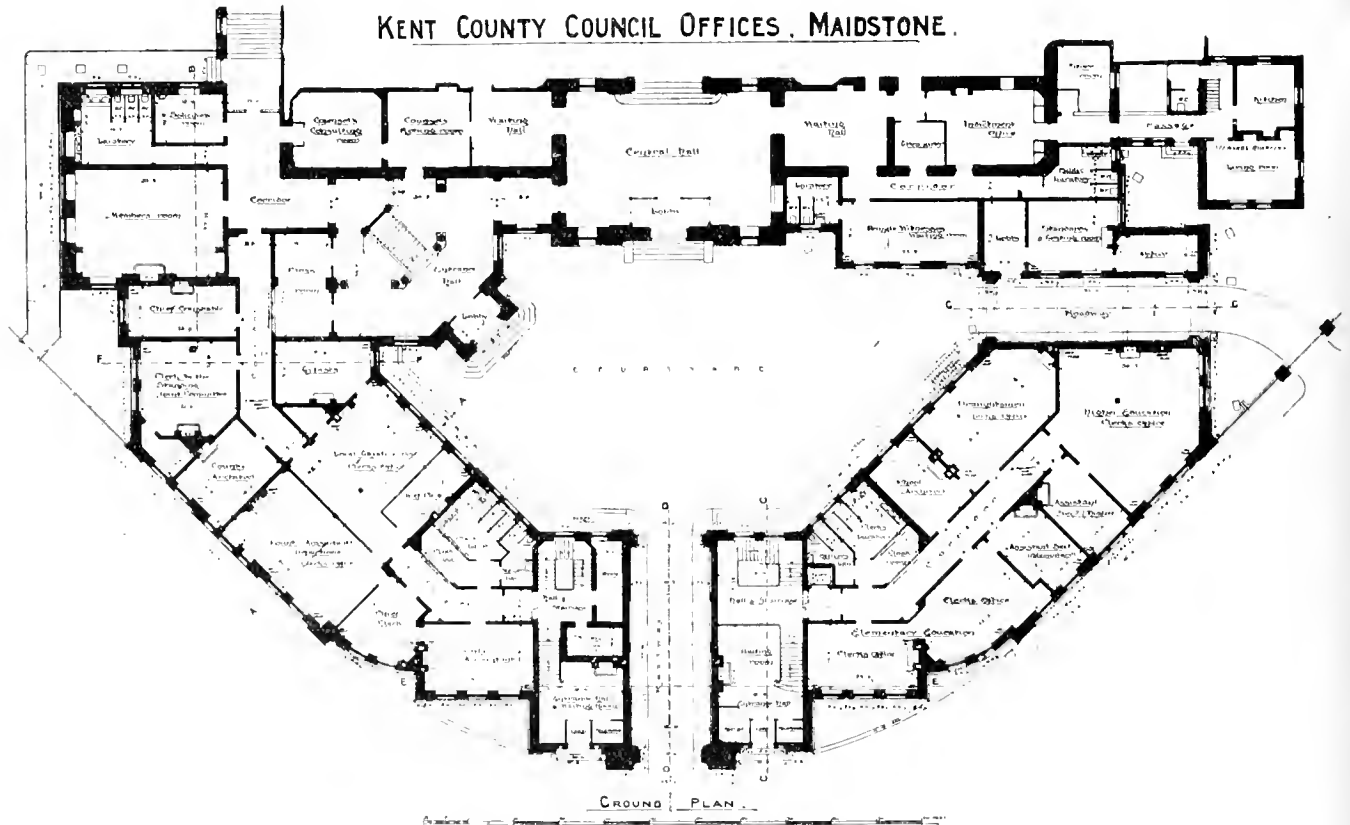

Our Illustrations.

NEW COUNTY OFFICES FOR KENT, MAIDSTONE.

This building has lately been completed from the designs of Mr. Frederick W. Ruck, the county architect for the Kent County Council. The new council chamber (54ft. by 40ft.), which will seat 104, is placed at the north corner of the site on the first floor. It is approached by a stone staircase, the lower flight of which faces the entrance vestibule, and from the landing there are two flights, one leading to the council chamber and the other to the grand committee room by a landing and corridor 12ft. wide. The floor of the council chamber is in stages, the difference in level of the several tiers of seats being 7in., making the floor in the centre of the chamber 1ft. 9in. lower than at the two entrances. The chamber is lighted at the north end by the windows, and also has a central lantern. Immediately opposite the entrance to the council chamber is situated the private room for the chairman of the council and chairmen of committees (22ft. by 16ft.), with a private lavatory adjoining. Next the spacious entrance-hall on the ground floor is a members' cloakroom, and by passing through the archways beneath the staircase the private room for the members of the county council is reached. It is 30ft. by 27ft., and is provided with a lavatory. All the offices on the ground floor have been arranged on the same level as that of the entrance-hall, which is 8ft. above the level of the ground at the entrance gates. By this arrangement a central carriage entrance through the building is rendered possible without interfering with the upper floor. As this carriageway severs the building on the ground-floor level, two entrances are necessary on either side of it, with separate staircases to the first floor. The right hand entrance is the principal one, and is that by which the whole of the building will be approached, except the county accountant's department, which is in the left wing on the ground floor. The entrance leads through a vestibule to a general waiting-room adjoining the porter's office. The ground floor of the right wing is entirely occupied by the department of the Education Committee and rooms for the schools' architect and his staff. The left hand entrance serves only the county accountant's department. On the first floor the office of the clerk of the county council is placed at the end of the wide corridor, his staff being in the centre building adjoining. The Education Secretary's office is in the right wing, with the general office and finance department beyond. Two rooms for the county land agent have also been provided in this wing. The left wing, with the exception before mentioned, is occupied by the department of the medical officer of health, and contains laboratory, incubating room, etc. On the second floor about half the area is allocated to the stores department of the Education Committee. The two remaining rooms (40ft. by 24ft. and 28ft. by 19ft.) have been provided for the county analyst. By locating them on the top floor special ventilation and top light have been obtained. A basement is formed under the greater portion of the building. The centre block contains the staircases, strong room for the clerk of the county council, two stokeries, and coke stores. In the right wing the Education Department has a large strong room, a storage room for stock, and a general filing-room. A common room for the whole of the clerks, with kitchen attached, is also provided. In the left wing a bicycle store is conveniently placed for the use of all the clerks, and is approached by a sloping way from the back of the main entrance. The record room (46ft. by 30ft.) is placed at the end of the corridor, and is easily accessible either from the secondary staircase or from the lift by the corridor in the sub-basement. There are also in this wing two rooms occupied by the medical officer of health. As the main entrance severs the general level of the basement, it is necessary to carry the

KENT COUNTY COUNCIL OFFICES, MAIDSTONE.

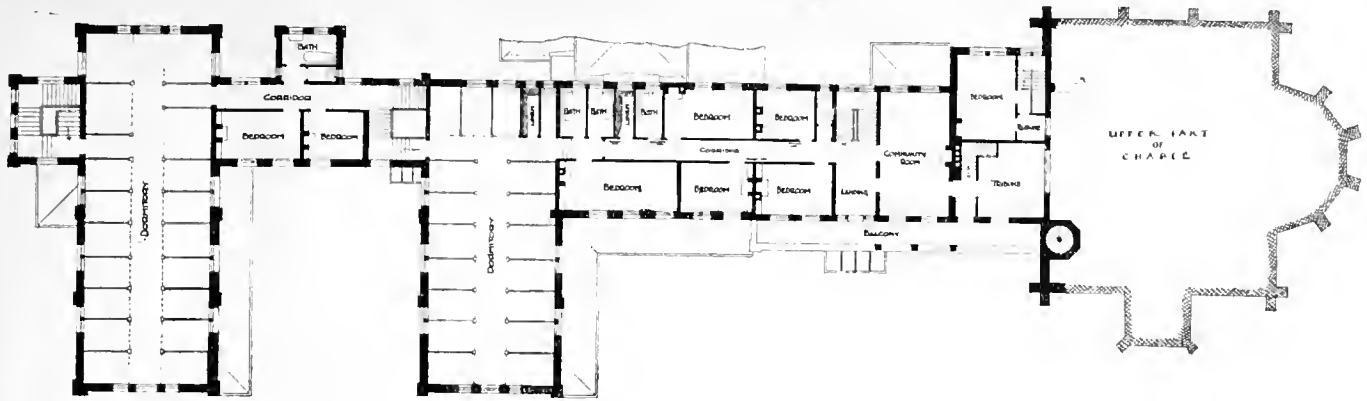

Mr. FREDERICK W. RUCK, County Architect.

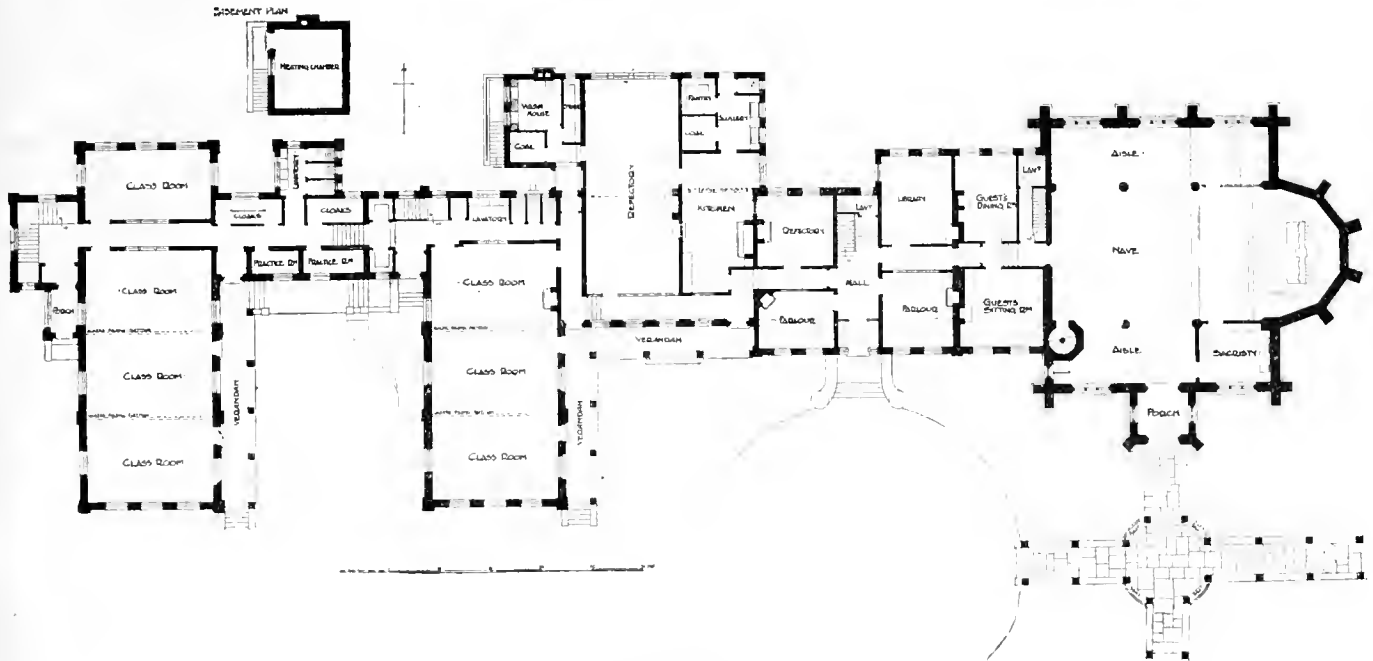

stokeries and fuel stores to a lower level, and form a second, or sub-basement, behind them to provide a corridor communicating between the lift and the record room. The coal store opens on to this corridor and is close to the lift. The office of the inspector of weights and measures is placed next the secondary entrance to the courtyard. Ample lavatory and cloakroom accommodation has been provided. The old offices of the clerk

of the county council have been converted into a caretaker's residence. The building is designed in a Renaissance style, so as to harmonise with the old Sessions House which adjoins. The rusticated work surrounding the archways and the plinths up to the ground floor is in grey granite, the central three-storied portion is faced with Portland stone, and the wings of the building and the whole of the fronts facing the inner court

is in Kentish rag and Portland stone. The building is of fireproof construction internally, the floors being in reinforced concrete and the staircases in stone. Each room is separately ventilated with inlet-tubes and exhaust flues. Fireplaces are provided in each room, but the warming is augmented by hot water on the low-pressure system. The cost of the building, including the alterations to the original waiting-halls

Ground Plan.

OUR LADYE'S CONVENT, BEXHILL-ON-SEA, SUSSEX.—Mr. J. S. D. HICKS, Architect.

to the courts, treasurer's, and indictment offices, etc., has been about £64,000.

OUR LADYE'S CONVENT, BEXHILL-ON-SEA.

This building has been erected on a site of about four acres, in a central position in Bexhill, on rising ground, facing south, and having extensive and beautiful views of the Channel and surrounding country. The work was commenced in March, 1913, and the larger portion of the convent buildings are now completed, together with the day school adjoining. Local bricks have been used throughout, and roughcast. The roof is covered with dark-red tiles. Built for the Sisters of Providence of the Institute of Charity, one of the well-known Catholic teaching Orders in England, it has been dedicated and opened by the Bishop of Salford as a high-class boarding-school for girls, and, apart from the day-school, will accommodate 100 scholars when completed. The chapel and west wing will be built in the near future. The builders are Messrs. Banks and Gearing, of Bexhill, and the architect is Mr. John S. D. Hicks, of 28, Magdalen-road, St. Leonards-on-Sea.

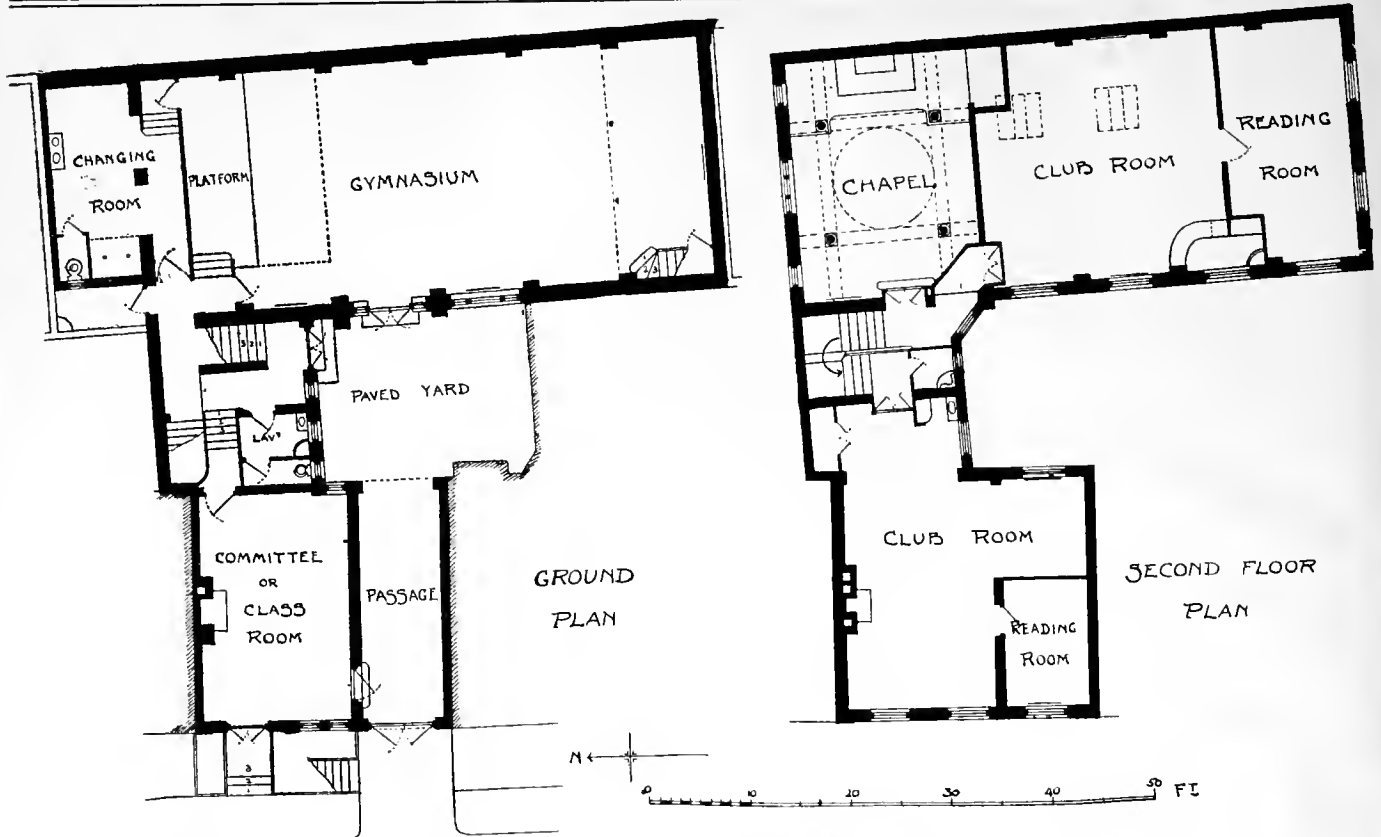

THE DINING ROOM, THE RED COTTAGE, HOLMBURY ST. MARY, SURREY.

In the BUILDING NEWS for June 19 last we gave the two plans and exterior view of this country house. We likewise printed some particulars about the work, and in course of our descriptive notes, sent us by the architect, Mr. Arthur H. Moore, A.R.I.B.A., a reference was made to the panelling and treatment of the dining-room, of which we now give a pen-and-ink perspective, drawn by the architect.

YARDLEY ROAD SANATORIUM, BIRMINGHAM.

The new buildings erected at Yardley-road depart from the general design adopted in the majority of sanatoria built up till now, as no protection whatever is afforded in front of the verandahs from the wind. The block is deep enough to enable the beds to be wheeled back to avoid rain, even during windy and boisterous weather. This special feature is partly the result of experience gained in the treatment of Birmingham consumptives; but it is mainly due to visits paid to Miss Hunt's Sanatorium at Baschurch, where children have been very successfully treated for many years in a climate quite as rigorous as that at Yardley-road, Birmingham. Miss Hunt's very simple and efficient arrangements have stimulated many authorities to adopt similar principles. At Northfield, crippled children from Birmingham, for example, have been kept in open-fronted wards during the winter without discomfort. Experience at Yardley indicates that for all but those acutely ill the largest amount of exposure to fresh air is an advantage. We give a detailed plan and section, which illustrates this principle as carried out at Yardley-road. The patients in this block will be kept out on the terrace night and day when the weather is settled, so as to obtain the open air unimpeded by any obstruction. During unsettled weather the beds, at night, will be under the glass verandah, and when stormy weather comes on the beds can be wheeled back to the wall, as shown on the plan, where they will escape all rain. Such an amount of exposure requires that suitable arrangements must be provided, otherwise life might at times become intolerable. Dressing-rooms in the proportion of one for

four or five patients have been provided, and bathrooms of one to every ten inmates. These are situated immediately behind the beds, so as to be convenient of access. Under each bed there is a rack to hold a dressing-gown and a pair of slippers, so that the patient may put these on when going to the dressing-room. In whatever position the bed may be these necessary comforts will be at hand, because they are moved with the bed. Drying rooms are provided and also linen stores. The women's block allows for seventy-five beds, capable of being used for women only or of being divided for use on one side for women and on the other side for men. The children's block of forty-four beds is similarly divided for the sexes. An observation block provides for ten cubicles. The administration block completely supervises the patients—thirty-six beds will be seen at any one time. This is of extreme importance in the treatment of consumptives, as well as in the matter of economical administration. A nurses' day-room, properly fitted up, is provided for each thirty-six beds. No heating whatever is provided. Experience assuredly indicates that heating is unnecessary and useless. Provision on the most liberal scale is made for a supply of hot water bottles, and ample through ventilation is insured. Each dressing-room contains an expanded-metal wardrobe, with padlock, a lavatory basin with hot and cold water, and the necessary provision for separation of tooth-brushes, etc. The terrace at the back of the building is arranged with rest chairs for use in hot weather, so that the patients may be in the shade. All the patients who are well enough to leave their beds have all their meals in the dining room, which is used for concerts and services. Care is taken to keep the food hot and served in the most appetising

THE MAGDALEN COLLEGE MISSION, SOMERS TOWN, N.W.—Mr. RONALD P. JONES, M.A., Architect.

manner. The observation block is used by children for a fortnight before being transferred to the main block. In this way a diagnosis can be made certain, and the chance of importing other infectious complaints greatly diminished. The laundry is equipped to deal with the clothing of the whole institution, and contains also a disinfecting apparatus for bedding, etc., and means of disinfecting and cleansing sputum-cups. The medical and nursing staff have accommodation in the administrative block, and the kitchen serves for both old and new portions of the building. The architect is Mr. W. H. Ward, Licentiate R.I.B.A., of 30, Paradise-street, Birmingham. He is also erecting a new sanatorium at Chesterfield. The Yardley buildings were carried out by Mr. Harvey Gibbs, builder, of Birmingham.

SANDY SHOOT, BURLEY, HANTS.

This house is built on the top of a slight hill a little north-west of the village of Burley. There are attractive views to the south, and also to the north, looking over a part of the Forest. The placing of the dining-room looking north was to take advantage of this. The house is built with hollow walls covered externally with rough-faced plaster, the pilasters at the angles being of narrow red bricks from Brockenhurst. The chimney-stacks are carried out in the same bricks. The gables are covered with oak weather-boarding, and the roofs with stone slates from Gloucestershire. The contractor for the work was Mr. H. Holley, of Lyndhurst. The architect is Mr. C. M. Oldrid Scott (Messrs. J. O. Scott and Son).

THE MAGDALEN COLLEGE MISSION, SOMERS TOWN, N.W.

This building, which was opened by H.R.H. Princess Christian a short time ago, was erected by subscription from past and present members of Magdalen College, Oxford, to house their Mission in Somers Town, which had for some years been conducted in various temporary quarters in the neighbourhood. It occupies the site of No. 5, Clarendon street, and an adjoining mews, and consists of a front building on the street and a gymnasium building at the back, connected by a block containing the staircase serving both. The front block contains on the ground floor a committee- or lecture-

room, with separate entrance from the street, and the open passage leading to the small yard in front of the gymnasium. Below the committee-room is the furnace-room, and a passage to the area, as an emergency exit from the gymnasium. The two upper floors contain each a clubroom, with a recess for a small billiard-table, and a reading-room adjoining. The gymnasium is 52ft. by 24ft., with an expanding platform at one end and a gallery at the other, which is large enough to be used for a technical class, if required. There is also provision for fixing a curtain and footlights for theatricals, etc. The changing-room has hot- and cold washing-basin and shower-bath supply, and is fitted with lockers. Above the gymnasium is a large clubroom and reading-room, with a self-contained refreshment counter, with cupboards, washing-sink, and water-boiler. In the design of the chapel it was desired to obtain as great a contrast as possible to the ordinary clubrooms, so as to emphasise the special purpose of this part of the building. A simple vaulted treatment was adopted, with a central dome carried on four columns, and side barrel-vaults. The columns are at present of unvarnished pine, stained brown; but it is hoped at some future time to replace them by oak, and to have corresponding pilasters and oak panelling on the walls. The exterior to the street is carried out in two shades of red sand-faced brick, with the college arms, carved in brick, over the centre windows. Terrazzo dadoes are used in the gymnasium, changing-room, and staircase, and all the other rooms have matchboarded dadoes. The internal woodwork and the fixed bookcases, cupboards, etc., are stained green and flat-varnished, and the rooms on the ground floor have wood-block flooring. The building is heated by radiators throughout, and by gasfires in the clubrooms. The architect was Mr. Ronald P. Jones, M.A., Licentiate R.I.B.A., a member of the college; the building, sanitation, and heating were done by Mr. J. A. Hunt, of Hoddesdon, Herts.

The Eastbourne Town Council unanimously adopted on Monday a housing scheme, which provides for the erection of 236 houses at a cost not exceeding £60,000. The Duke of Devonshire has provided the sites at a very moderate price, and has also granted allotments free for one year to about 150 workmen.

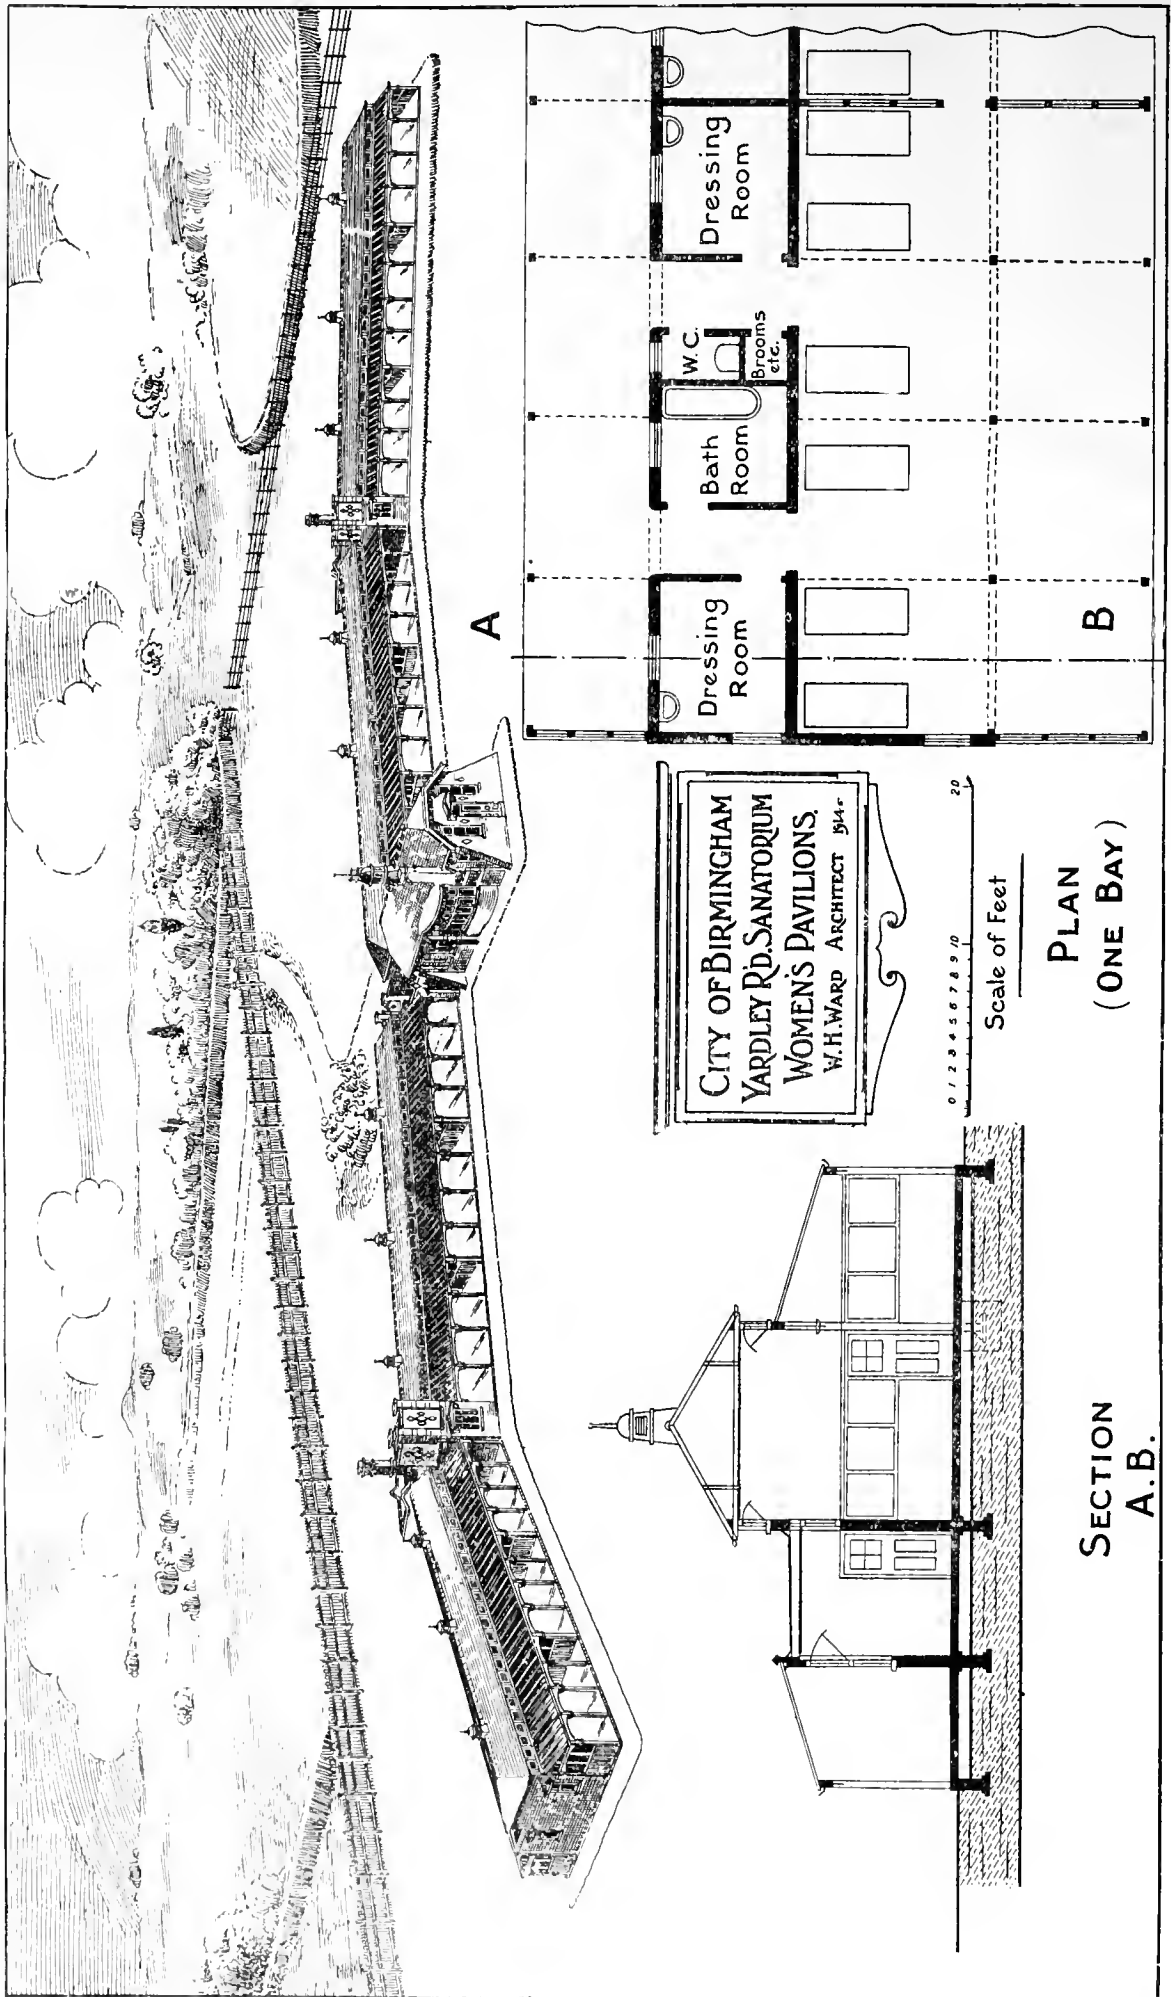

Building Intelligence.

BRISTOL.—The condition of the tower of St. Stephen's Church, Bristol, has for several years been a source of great anxiety, and some months ago the vestry had the building examined. The architects (Messrs. Paul and James) agreed that the danger had been chiefly caused by the excessive amount of smoke poured into the city air, which has eaten away the face of the stone to a dangerous extent, and stated that only by complete and thorough restoration could the structure be preserved. An approximate estimate of the cost of restoration of the tower and south porch was placed at between £3,500 and £4,000; but the architects could not give a close estimate at the time, as they could not say definitely what amount of stone would have to be cut out. In response to a private appeal the vestry committee have received £1,950 from the Ringers' Society, and £500 from the Society of Merchant Venturers, to which the vestry added a contribution of £200. Under the circumstances it has been decided to proceed with the restoration of the tower, in order to provide immediate work, and it will be continued so long as funds will permit.

A joint committee of the New York Chapter of the American Institute of Architects and the Architectural League, acting as a jury, have awarded to Mr. Bertram Grosvenor Goodhue the commission to complete the designs and plans for the proposed New York City building at the Panama-Pacific International Exposition to be opened early next year. The final plans for Denmark's pavilion at the Exposition have been completed by Professor Anton Rosen, architect, of Copenhagen, and work on the building will be started in the early part of September.

An inquiry was held at the Council House, Birmingham, on Wednesday by Mr. T. C. Ekin, on behalf of the Local Government Board, into an application by the Birmingham Tame and Rea District Drainage Board for sanction to borrow £61,560. The money is required for works of sewerage and sewage-disposal, including the execution of works in the parish of Solihull. Later in the day Mr. Ekin also held an inquiry into an application by the Birmingham Corporation for permission to borrow £33,000 for works of sewerage and surface-water drainage at Erdington.

Currente Calamo.

The moratorium, to put it mildly, is not helping builders, and representations to that effect have been made in proper quarters, which we hope will have consideration. Meanwhile we urge on all clients that it is unfair and unwise to defer payments on certificates, and that any attempts to enforce time-penalty clauses, where employers are unable to carry on for want of funds, will be most reprehensible. It is also the occasion, we think, for a compulsory release of retention money immediately on completion of contracts. Payment of these balances would in many cases help firms to carry on who may otherwise have to stop partially or wholly. It may also be desirable for Government to fix maximum prices, as it has done with regard to food. War prices have certainly been put up, in some cases, beyond reasonable limits, and if proper inquiry is made it will be found that there is as yet no actual shortage. Where there is shortage it is mainly in German materials, and we are pleased to know that in several instances really British firms have promptly supplied, at fair prices, material of better quality and manufactured here. We hope architects, builders, and clients will remember this by-and-by, when "British" firms "made in Germany" will doubtless be again to the fore.

The Local Government Board has issued a circular to town councils, district councils, and public utility societies, inviting them to take action under the provisions of the Housing (No. 2) Act of the present session of Parliament. The Board state that it is the intention of the Government that such sums as may be made available under the Act shall be utilised for the joint purpose of providing and improving housing accommodation for the working classes and of preventing or mitigating unemployment in the building trades. The Treasury will be prepared to consider advances of money to local authorities on approved schemes of building, and any advance made will be repayable in the usual period, sixty years in respect of substantial buildings, and eighty years in respect of land purchase. The circular continues: "It is clearly desirable that the President of the Local Government Board and of the Board of Agriculture and Fisheries should be in possession at the earliest practicable date of full information as to districts in which further housing for the working classes is required, and in which, in the opinion of the local authority, unemployment exists or is likely to arise which the undertaking of building operations might prevent or mitigate. It is also necessary that they should know how far in every such case the local authority will be able and willing to submit schemes for housing the working classes forthwith and to undertake the execution of these schemes within a short period. It is not essential that the unemployment or likelihood of unemployment should exist in the precise area in which housing accommodation is required, provided that the area in which the building is to be undertaken is readily accessible by labour from the district in which the unemployment exists or is anticipated."

Mr. Harold Farmer, a member of the firm of Messrs. Leopold Farmer and Sons, who are specialists in the letting of factory

sites, states in an interview with a representative of the *Daily Telegraph*, that active measures are being taken by British manufacturers to equip themselves for an extension of their business. A large number of firms are seeking factories for the purpose of opening up industries hitherto carried on with success by Germany or Austria. That this is so we have full and satisfactory knowledge ourselves. Much depends, however, Mr. Farmer points out, upon whether the banks will help traders by advancing money on their orders instead of on securities. Notoriously in Germany traders have had, in addition to Government support, financial assistance from the banks on orders obtained, and that has enabled commercial concerns to carry on and extend business. In this country the first question asked by a bank is: What security do you offer? It is imperative that steps be taken without delay to enable manufacturers to prepare for a trade boom by building factories and laying down the necessary plant. If only the banks will afford reasonable facilities there may be great developments in the immediate future, and every indication points to the fact that they may do so with safety and profit.

There should be a good field now for British decorators and furnishers in Russia. The British Vice-Consul at Kharkov reports recently as follows:—"During my recent visit to Moscow I heard of an interesting method of selling furniture, adopted by a German manufacturer. His agent, an employé of the firm, is both architect and designer, and offers his service for every kind of artistic and decorative work. This includes designing furniture and house equipment generally, as also wall papers and stucco-ceilings suitable for house-owners and retail shops. The firm supplies him with drawings and even complete sets of model furniture on a miniature scale and he adapts these to the varying circumstances. The firm sends German workmen for fitting the furniture and wainscoting, also upholsterers and workers in plaster, and hands over the rooms quite ready for use. I am told that the firm is successful in its work, the designs and workmanship being excellent and the prices comparing favourably with those of Russian first-class makers. The agent's circle is spreading, and he is now extending his work to St. Petersburg."

Through art journals, more particularly German ones, taking up the subject of house-decorating, and through foreign architects insisting on specially designed furniture, the better class house-owners realise that it is better to engage designers and spend more money on the decoration of their homes than formerly. As yet this new mode of furnishing is confined to the principal cities, St. Petersburg, Moscow, and perhaps Warsaw; but work could undoubtedly be found on the big estates and in provincial towns. Before exporting furniture and upholstery material to Russia the Russian Customs tariff should be carefully consulted. Thus, for instance, inlaid wood and carving of all kinds pay a heavy duty, and should be forwarded separate from the furniture. Silk materials or materials interwoven with silk, are excluded through the prohibitive tariff. Boards at the back of cupboards and unvarnished on the other side, pay a lower duty, and can occasionally be packed separately with advantage. Probably now we are so closely

allied in the field, representations by our own Government would induce a revision of the tariff in favour of British firms.

In appointing a receiver and manager of a pianoforte company with a German name, Mr. Justice Shearman, in the Vacation Court on Wednesday, said the Receiver must undertake not to remit any money or goods to a hostile country. He did not think a business which was being owned beneficially by foreign enemies could be carried on at all in this country without the license of the Government. He was informed that the Government would not give the authority unless they were satisfied that no money would be remitted to an alien enemy. It must all remain in this country. We think Mr. Justice Shearman is right, and that this adds another to the risks all Englishmen are running who enter into any business relations with Germans, or who, if they have had past dealings with such, pay them any money for accounts owing.

Mr. H. C. Stephens, the veteran ink and stain-maker, makes a novel and really most advantageous offer to his world wide customers. He has cabled all abroad, and all shipping agents, that he will replace free of cost, any consignments of Stephens' inks seized or destroyed by the enemy. Thus, as all buyers will be indemnified against loss, they will be able to order unhesitatingly the best ink made here or anywhere, and so help one of the oldest British manufacturers to keep his hands employed and retain his share of British trade. We are sure this example might be advantageously followed by others, and have little doubt it will be. One thing there is neither Mr. Stephens nor any one else can do. Black as the familiar blotch on his well-known wall advertisement may be, and enduring as his stains are acknowledged to be by all users, they are outdone, and must remain so to all time, by the foul stain on the German name and the irremovable blot on German honour that scrupled not to inflict barbarous and treacherous war on the brave Belgian people who have so manfully maintained their neutrality in the face of such long odds, and at the cost of so much blood and treasure, against the truculent invader who has defied the guarantees of Europe and outraged humanity.

The meeting of advertising men at the Cannon-street Hotel last Tuesday should convince advertisers that they are wrong and unpatriotic in cutting off advertising. The resolution passed requested the Press to do its best to convince the public of the stability of trade. We believe confidence would soon be restored if traders bravely went on advertising as usual. One point made was that an advertising campaign might help the movement to capture German industries. British manufacturers who can make things as well as the Germans should seize the opportunity of telling the public so, and thus do good all round. One suggestion was the compilation of a list of British substitutes for the excluded German goods. The fact was also emphasised that a good deal of advertising has been stopped owing to panic, and not to necessity. That should be borne in mind. As we have already stated, with drawal of advertisements has undoubtedly been regarded by some of our readers as a tacit confession of inability to supply, and

this in cases where such an impression was quite unfounded.

Therefore—Advertise. — The following paragraph, from an article by Andrew Lang, is worth remembering just now by hidlers of their light under bushels. "When a goose lays an egg," says Mr. Lang, "she just waddles off as if she was ashamed of it—because she is a goose. When a hen lays an egg—ah, she calls heaven and earth to witness it. The hen is a natural-born advertiser. Hence the demand for hens' eggs exceeds the demand for goose eggs, and the hen has all the business she can attend to."

Engineering Notes.

IPSWICH.—The town council have decided to purchase property from Messrs. Fison at the corner of Bridge-street and Dock-street, in order to effect an improvement in connection with the proposed reconstruction of Stoke Bridge, the lowest one spanning the river. The bridge is to be constructed in ferro-concrete, with a span of 70ft. and a headroom of 7ft. 10in. above high-water spring tides, and by the acquisition of the property mentioned a minimum width of 45ft. between the parapet walls will be possible. The total estimated cost of the entire scheme is £16,000.

PARLIAMENTARY NOTES.

HOUSING ACT FOR IRELAND.—In the House of Commons on Tuesday, Mr. Birrell, Chief Secretary for Ireland, moved the second reading of the Bill to extend the Housing Act of the present session to Ireland. The motion was agreed to without discussion, and the Bill was referred to Committee of the whole House instead of a Grand Committee. The measure passed through Committee without amendment, and was read a third time on Wednesday.

PROVISIONAL VALUATIONS.—Mr. Lloyd George, Chancellor of the Exchequer, informed Mr. Protheroe on Wednesday that the Commissioners of Inland Revenue had decided to extend the time for giving notice of objection in the case of all provisional valuations served within sixty days before the mobilisation of the British troops or afterwards up to a date to be notified in the future.

The death is announced, after a short illness, of Mr. James Crofts Powell, a member of the firm of James Powell and Sons, of the Whitefriars Glassworks.

The Thurrock, Grays, and Tilbury Joint Sewerage Board have appointed Mr. L. D. Holgate, of Tiverton, sewage-works manager in place of Mr. S. Flinn, resigned.

An inquiry was held at Ince-in-Makerfield, yesterday (Thursday), before Mr. A. G. Drury, an inspector under the Local Government Board, respecting an application from the urban district council for leave to borrow the sum of £17,500 for works of sewage disposal.

A council school, which has been built by the Durham County Education Committee, at a total cost of £12,531 1s. 9d., has been formally opened by Mr. W. Rushworth, F.R.I.B.A., of Durham, the county architect, prepared the plans, and Mr. C. Groves, of Chester-le-Street, was the contractor.

It is officially announced that the partnership hitherto existing between A. S. Barley and J. S. Escott, builders, contractors, and decorators, at Westcliff, Southend-on-Sea, under the style of Barley and Escott, has been dissolved. It is also announced that the partnership heretofore subsisting between T. J. Knight and L. R. Knight, builders and contractors, Chertsey, under the style of Thomas Knight and Sons.

The Corporation of Manchester have decided to immediately proceed with the making of a road leading from Slade-lane to Cheadle, the total cost of which will be £171,500. The road will be nearly five miles in extent and 80ft. in width, and will provide employment for Manchester's unskilled labour for many months to come. The rural district council of Northwich have received the sanction of the Local Government Board to the borrowing of the sum of £127,000 for the provision of working-class dwelling-houses in the township of Eddisbury.

Correspondence.

ASSISTANCE TO THE ENEMY.

To the Editor of the BUILDING NEWS.

SIR.—Right glad were we to read your suggestions for architects' guidance so that they may cease to specify goods which will enrich the enemies of our country.

As makers of metal casements and leaded glass, we have for years consistently used only British materials; but by the apparent apathy of architects our British buildings are here, there, and everywhere fitted with windows made of German steel, and no trouble is taken or questions asked in regard to same. But many will say, "How are architects to know, and what is the remedy?" Truly a very simple one: Ask manufacturers to produce invoices of bars from rolling mills, and they would then find out, and put a stop to giving a privileged position to the users of foreign steel which makes no better or more watertight windows.—We are, etc.,

Croydon.

FAIRPLAY.

AMERICAN ADVERTISERS.

SIR.—In case any of your advertisers are fired with enthusiastic desire to emulate the advertisements of their American friends, I cull one or two gems from a pile of American journals before me. I think you hardly picked the plums in your leader of Aug. 14. Here is a Milwaukee plaster-mixer maker's irresistible appeal:—

"I am a new thing in the world—the best ever born—the one you want. I've been a long time coming—but I have arrived. I'm as much needed on your job as you are—I mix your plaster as you have never had it mixed before—no lumps, no uneven mixture—a good, pure, healthy, solid mix—a pudgy mix—that will please your plasterers and make no waste. I mix plaster that is plaster—get that—not the plaster that you mix in the old-fashioned hand-hoe way, but a good solid pudgy—that holds together and makes no waste. You need me in your work, for I mix a three-sack batch in from four to five minutes—thirty-six sacks an hour. CAN YOU BEAT IT?"

Here is the less florid effusion of a Wisconsin maker, who actually quotes a British peer to hammer his stuff into the brains of his readers:—

"Rosebery says: 'International' in the end—why not now? Here is a mixer that is the biggest asset that any contractor can possibly secure. Built especially for the work that requires the most—and for the contractor who wants the best. Be sure you get our catalogue and prices."—I am, etc.,

Brighton.

LEONARD FOSTER.

SOUTHAMPTON HARBOUR BOARD.

SIR.—In your last number, under "Chips," the late Mr. G. F. L. Giles is stated to have been engineer to this board. This is not correct. The office was held from 1881 to 1897 by the late Mr. J. G. Poole, and since and at present by yours faithfully,

E. COOPER POOLE.

Harbour Offices, Town Quay, Southampton,
August 24, 1914.

A Local Government Board inquiry was held at Ipswich into an application of the corporation for permission to borrow £8,000 for the extension of the isolation hospital built a few years ago on the Foxhall-road.

In the report of the committee on ancient earthworks and fortified enclosures just issued by the Congress of Archaeological Societies, the absence is regretted of any power in the Ancient Monuments Consolidation and Amendment Act to compensate an owner for pecuniary loss through the application of the Act to an ancient monument on his property. Without such power the committee fear it will not be possible to avert the destruction of such places as the burgh of Edward the Elder at Wilham, Essex, which are being demolished for the sake of profit.

Our Office Table.

The Newcastle-under-Lyme corporation has asked for the sanction of the Local Government Board to a loan for the erection of twenty-nine workmen's dwellings on land in the Lower Green district, which was cleared of slum property a few years ago. The inquiry held by a Local Government Board Inspector last week, revealed a curious state of things in reference to cottage property. There was a consensus of opinion that the demand for this class of property in Newcastle has for some years been very great, and the lack of it a source of extreme inconvenience and a cause of serious overcrowding. Yet all the efforts of the corporation to sell the land they now propose to build on were unsuccessful. A local property-owner stated that houses in that locality were always tenanted, and he would rather have cottages there than anywhere else in the town. He had recently had thirteen applicants for one house immediately it became vacant. The law that the demand controls the supply has not operated here, and the council have had to undertake to supply the demand themselves. They have the advantage of being able to borrow on favourable terms, they do not desire a profit, and in the event of a loss it will fall on the ratepayers. Their position is, therefore, materially different from the private trader, who builds for a profit and cannot afford to risk a loss. But the striking fact remains that builders find it impossible to erect workmen's dwellings at a profit to meet an abnormal demand. At the inquiry it transpired that in the houses to be built by the Newcastle corporation, no parlour will be provided. There will be on the ground floor a large living-room with scullery and domestic offices behind and a lean-to roof. The front door will open into a passage partitioned off from the living-room.

A company is being formed for developing the Admiralty land at Rosyth, which, by arrangement with the Local Government Board for Scotland, will erect some 8,000 houses at Rosyth, at an estimated cost of £1,000,000. The Local Government Board are empowered to advance to the utility company sums to the extent of £900,000, as may be required as the work proceeds. The remaining £100,000 will be subscribed by the public to the utility company, and the latter proportion of that amount has already been arranged for. The money will be advanced by the Government to the company at a reasonable rate of interest, and the whole sum, it is stipulated, will be repaid within sixty years. The company is to be limited to a dividend of five per cent. There is no restriction as to the amount of shares to be held by any individual holder. The houses are to be erected under conditions which will conform to the town-planning scheme adopted by the town council of Dunfermline, and now submitted to the Local Government Board for approval. It is hoped that work at Rosyth will be begun within the next few weeks.

The calendar of the Royal Technical College, Glasgow, for the session 1914-1915 has just been issued as an octavo volume of 508 pages, handsomely bound in purple cloth. Sections are devoted to architecture and building, chemistry, electrical engineering, mining engineering, civil and mechanical engineering, and to a number of other crafts and sciences in which instruction is given. The extent and character of the courses of study are so indicated as to enable students to gain an idea as to how much ground they may cover during a session, while the specimen examination papers which are appended should prove extremely useful. The calendar includes a history of the college, and a description of the scheme by which it became affiliated with the University of Glasgow in March of last year. The Glasgow School of Architecture has as its director Professor Eugene Bourdon, B.A., with Professor

Charles Gourlay, B.Sc., A.R.I.B.A., as head of the Architecture and Building Department at the Technical College, and Mr. J. S. Boyd as lecturer. A companion volume to the calendar is a guide to the affiliated evening classes in science and technology conducted in the burghs surrounding Glasgow, and to the ordinary evening classes of the College.

In our issue of August 14, on page 229, we reproduced a statement from the *Newcastle Daily Chronicle* of August 7, to the effect that Mr. Thomas Adams, who had been the head of the Town-Planning Department of the Local Government Board since its establishment, was retiring in October, and would be succeeded by Mr. G. L. Pepler, of the firm of Messrs. Pepler and Allen, architects and surveyors, of Howard House, 4, Arundel-street, W.C. We are informed by Messrs. Pepler and Allen that the statement is incorrect, and we notice that a paragraph to the same effect appears in our *Newcastle* contemporary of Wednesday last.

There have recently been driven for Halifax harbour works what were thought to be reinforced-concrete piles of record length—viz., 77ft., 20in. square; but these have since been exceeded by those at Havana. Now we have tenders called for a pier in San Francisco in which 91ft. piles are required to be constructed. The depth of water varies from 4ft. at the shore end of the pier to 56ft. at the outermost point. The 91ft. piles will be 20in. square, weighing 15 tons each, and are specified to carry, in addition to their weight, a load of 40 tons. The concrete used in the piles will be in proportion of 1 to 5. The piles are required to be allowed to set for forty-five days before being driven.

A 10ft. concrete-lined steel pipe recently built in Baltimore to deliver water from the Loch Raven reservoir to the Loch Raven-Montebello tunnel at a point just below its gatehouse is described by Ezra B. Whitman, president of the Water Board, in the monthly journal of the Engineers' Club of Baltimore. It was estimated that this pipe could be constructed, and that the relining of one mile of the old 12ft. tunnel could be done for an estimated cost of about 300,000dol., as compared with the estimated cost of 480,000dol. for a new 12ft. tunnel 6,340ft. long joining the old tunnel one mile below its upper end. The pipe is made in alternate inside and outside telescoping lengths 15ft. long and of 10ft. minimum inside diameter. Changes in grade and alignment are effected by bevelling the ends of the section. The pipe is made of soft open-hearth rivet steel intended to have sufficient ductility to stretch rather than crack in case of unusual strain from water-hammer or settlement. The metal is 7-16in. thick, although a thickness of less than 3in. would theoretically suffice for the stress developed. The pipe is supported on concrete cradles intermediate between the riveted joints and having a radius slightly greater than that of the pipe surface.

Building operations in United States towns for May, 1914, as shown by the returns just to hand, indicate that there was a substantial increase over the corresponding month last year. Permits were taken out in eighty-eight leading cities for the construction of 21,994 buildings, involving a total estimated cost of 71,118,570dol., according to official reports by surveyors, as against 22,553 buildings, involving 68,788,890dol., for the same month a year ago, a decrease of 559 buildings, and an increase of 2,329,680dol., or 3 per cent. Of the 88 cities there were gains in 43 cities and losses in 44; but this does not give the true colour to the situation, inasmuch as practically all of the larger cities all over the country show large gains, while a large number of small places in which the figures were abnormally large last year, show a material falling off because of the fact that they are returning to normal conditions. The one particular exception among the larger cities in Chicago, where the brick strike almost put an end to

construction for a time, shows a decrease of 22 per cent. as compared with the same month a year ago.

MEETINGS FOR THE ENSUING WEEK.

THURSDAY.—London Salon of Photography. Private View, 11 a.m. to 6 p.m., 5a, Pall Mall East, S.W. Open daily until Oct. 17.

SATURDAY (SEPT. 5).—Royal Photographic Society's Exhibition, Suffolk-street Galleries, Haymarket, S.W. "St. Paul's Cathedral, Past and Present," by F. J. Hall. 8.30 p.m.

CHIPS.

Hull Corporation have decided to borrow £14,438 for the erection of a sanatorium and hospital at Cottingham.

The meetings of the Municipal Waterworks Association, which were to have been held at Liverpool this year, have been abandoned in consequence of the war.

The Wisbech Town Council have accepted the tender of Messrs. Wilkinson and Co., of Elm, amounting to £2,500, for the erection of houses in connection with the Leverington-road housing scheme.

The jubilee of the opening of the Primitive Methodist chapel at Bevois Town, Southampton, has been marked by the erection of Sunday-school premises, which were opened on Wednesday week. Mr. Ingalton Sandels, of Southampton, was the architect.

The annual report by the Board of Trade states that the total number of cases under the Bankruptcy and Deeds of Arrangement Acts in England and Wales during 1913 was 5,769—a decrease of 582 as compared with the preceding year. The largest aggregate liabilities are, as usual, shown in the case of builders, with a total of £404,279.

The Development Commissioners have offered to the trustees of the River Glenn, Lincolnshire, a grant of £35,000 and a loan of £40,000 at 3 per cent. for the improvement of the river by a scheme which would provide relief work for the unemployed. Conditions of the grant are that the work should be begun at once, and that men out of work should be engaged as far as possible.

It was reported at Sheffield on Saturday that the Local Government Board have decided, without holding an inquiry, to sanction a loan of £68,900 for the extension of the Sheffield City Hospitals for Infectious Diseases at Lodge Moor. A portion of the hospital accommodation has now been set aside to meet the requirements of the military authorities.

A new ferro-concrete bridge has been built over the River Ebbw about two and a half miles from Newport, Mon., on the Cardiff main road. It is of three arches of monolithic type, each about 20ft. span and 10ft. 6in. in width. The bridge was designed by Mr. William Tanner, F.S.I., county surveyor of Monmouthshire, and the contractors were Messrs. E. Turner and Sons, Ltd., of Cardiff.

The rural district council of the Isle of Wight have decided to commence practically at once the carrying out of their £50,000 scheme for re-surfacing with granite the rural main roads in the island. The Local Government Board, the Road Board, and the Development Commissioners will, as far as possible, facilitate the making of grants, and the granting of loans for such public works.

The Committee of the Exhibition of Modern Spanish Art, of which the Duke of Wellington is honorary vice-president, have decided that the proceeds shall be devoted to the Prince of Wales's National Relief Fund. The exhibition will open at the Grafton Galleries on October 3, and will include the whole of the 250 works shown this summer at the Brighton Public Art Galleries, with the addition of some 50 more.

For some years the St. Asaph Rural District Council has been discussing the question of an additional water supply for the district of Llandulas, a resort between Abergele and Colwyn Bay. The Local Government Board are now pressing the matter forward, and held an inquiry on Tuesday into an application from the rural council for sanction to borrow £2,000 for carrying out the scheme.

There was no opposition at an inquiry held at Sleaford the other day on behalf of the Local Government Board to the urban district council's proposal to borrow £2,300 for the purchase of private rights and tolls of the Sleaford market. The council, it was stated, are paying twenty-five years' purchase on the income which the Marquis of Bristol at present received from the lessee of the market-place, which was distinct from the cattle market.

LATEST PRICES.

N.B.—All prices must be regarded as merely approximate for the present, as our usual sources of information are in many cases failing us. Miscellaneous metals and timber we omit altogether, as published figures differ so widely that they are, we fear, in many cases quite unreliable.

Table listing various brick types and their prices per 1,000, including First Hard Stocks, Second Hard Stocks, and Accrington Air Bricks.

Net free on rail, or free on boat at works.

GLAZED BRICKS.

Table listing various glazed brick types and their prices per 1,000, including White, Ivory, and Best Salt Glazed bricks.

Table listing cement and lime products and their prices, including Best Portland Cement and Grey Stone Lime.

TRADE NOTES.

Boyle's latest patent "air-pump" ventilators have been applied to the town-hall, Newport, Salop.

Mr. Beresford Pite has removed his residence from 2, York-gate, Regent's Park, to 21, Willow-road, Hampstead, N.W., as from midsummer, 1914.

Messrs. C. Jennings and Co., 952, Pennywell-road, Bristol, inform us that their works are running full time manufacturing woodwork of every description as usual.

We are asked by the proprietors of Pudlo to state that this material is British throughout: every one of its ingredients is British.

CHIPS.

The Failsforth Urban District Council have appointed Messrs. Woodhouse and Howard, of Manchester, as architects for the new public baths.

At Nether Stowey parish church on Monday the whole peal of bells which has been rehung and recast, was rededicated by the Suffragan Bishop of Taunton.

The Co. Mayo Lunatic Asylum at Castlebar is about to be enlarged by a wing for 250 patients, from plans prepared by Messrs. Doolin and Butler, of Dawson-street, Dublin.

Mr. F. H. Tulloch held a Local Government Board inquiry at Colchester into an application by the corporation for their sanction to borrow £8,325 for works of paving.

The rural district council of St. Austell are recommending the county council of Cornwall to proceed with the maining of Par Moor-road and the road from St. Denis to St. Austell.

The extension of the Cliftonville Parade and the construction of the Hedges Gap Bridge at Margate have just been carried out from plans by the borough engineer, Mr. E. A. Borg.

The contract has been let for the carcass of the warehouse and offices and garage to be erected in Salford, Manchester.

A Local Government Board inquiry has been held at Blaenavon by Mr. E. Leonard into an application by the urban district council for sanction to a loan of £13,350 for the purchase of land and the erection thereon of fifty dwellings for the working classes.

St. Joseph's Roman Catholic Day Schools, erected in the Steelhouse-lane district of Wolverhampton at a cost of £6,600, were formally opened on Monday by the Archbishop of Birmingham, Dr. Halsey.

Godson, G., and Sons... £4,568 0 0
Brown, H. ... 4,549 0 0
Collins and Godfrey... 4,339 0 0
Fairhead, A., and Son... 4,287 0 0
Monk, A. ... 4,265 0 0
Knight, H., and Son... 4,198 0 0
Bentley, J., and Sons... 4,198 0 0
Newby, C. J., and Bros.*... 4,440 0 0
* Accepted.

ERITH.—For erection of a public elementary school at Lower-road, Belvedere, for the urban district council:—

Ellingham, J. W., Dartford... 9,169 10 0
Kazak, L., Belvedere... 9,169 0 0
Friday and Ling, Erith... 8,974 0 0
Gunning, G. H., and Son, The Mount, Erith (accepted)... 8,749 0 0

EYE, SUFFOLK.—For erection of workmen's dwellings, for the Hartismere Rural District Council. Messrs. Winkworth and Winkworth, 23, Great Coleman-street, Ipswich, architects:—

Theobald and Sons, Needham Market... £470 0 0
Hogg, R., and Son, Cony Weston, Bury St. Edmunds... 465 0 0
Andrews, H. A., Botesdale, Diss... 458 15 0
Scott, R., Old Newton, Suffolk... 407 0 0
Trudgett, J. W., Colchester... 394 0 0
Howes Bros., Ixworth, Bury St. Edmunds*... 384 15 0
* Wortham.
Theobald and Sons... 490 0 0
Andrews, H. A. ... 461 2 6
Hogg, R., and Son... 458 0 0
Scott, R. ... 447 0 0
Howes Bros.*... 405 10 0
Trudgett, J. W. ... 402 0 0
Wyverstone.
Theobald and Sons... 485 0 0
Hogg, R., and Son... 465 0 0
Andrews, H. A. ... 463 2 6
Scott, R. ... 407 0 0
Trudgett, J. W. ... 402 0 0
Howes Bros. ... 388 15 10
Thorndon.
Theobald and Sons... 500 0 0
Andrews, H. A. ... 461 2 6
Scott, R. ... 447 0 0
Howes Bros.*... 424 4 2
Trudgett, J. W. ... 402 0 0
Thrandeston.
Theobald and Sons... 480 9 0
Andrews, H. A. ... 461 2 6
Scott, R. ... 447 0 0
Howes Bros.*... 405 10 0
Trudgett, J. W. ... 402 0 0
* Provisionally accepted.

EAST LANCING.—For sea-defence work between groynes 32 and the harbour mouth, for the Sea Defence Committee:—
British Steel Piling Co. (accepted) £2,161 1 0

GLENBURN.—For installation of heating apparatus at the new school, for the Moulton and Prestwick School Board:—
Boyd and Sons, Paisley ... £311 0 0
(Recommended for acceptance.)

GOSFORTH.—For taking up the existing asphalt footway in Kenton-road and laying new flag footway, for the Gosforth Urban District Council. Mr. G. Nelson, A.M.I.C.E., engineer and surveyor:—
Simpson, G. E., Newcastle-on-Tyne ... £432 15 6
Henderson, J. W., Gosforth ... 364 19 11
Tulip, W., Gosforth (accepted) ... 341 2 4

KILMARNOCK.—For concrete work in connection with new generating station at Kilmarnock, for the corporation:—
Train, J., and Taylor ... £41,536 0 0
(Recommended for acceptance.)

LETCOMB REGIS.—For the construction of six workmen's dwellings in three pairs, for the Wantage Rural District Council. Mr. J. W. Harris, East Challow, Wantage, engineer and surveyor:—
Cox and Sons, Abingdon ... 1,480 0 0
Bunce, H., Letcomb Regis, Wantage ... 1,448 0 0
Wheeler, G., Abingdon ... 1,350 0 0
Sims and Son, Oxford ... 1,292 0 0
Berritt, J. P., West Hanney, Wantage ... 1,270 0 0
Stacey, C., Aldbourne, Wiltshire (accepted) ... 1,156 0 0

MARDEN.—For the reconstruction of the Plain Bridge at Marden, for the rural district council of Maidstone:—
Burrows, W. T., Maidstone ... £214 0 0
Stanley and Co., Marden ... 196 10 0
Martin and Newman, Maidstone* ... 97 10 0
*Accepted.

POLEGATE.—For executing the drainage scheme, for the Hailsham Rural District Council:—
Streeter, A., and Co., Ltd., Guildford (accepted) ... £4,933 4 2

PORTSMOUTH.—For alterations to Staveshaw pumping station, for the corporation:—
Davis, G. J., and Son ... £1,050 0 0
Evans, W. W., ... 990 0 0
Springs, E. and A. ... 860 0 0
Tanner, J.* ... 841 10 6
*Recommended for acceptance.

PORTSMOUTH.—For supply of a steam boiler, &c., in connection with hot-water system at the town hall, for the corporation:—
Shervell, Ltd. ... £372 0 0
Davis, H. and W. ... 361 0 0
McKinlay and Co., Ltd. ... 359 0 0
Vosper and Co., Ltd. ... 350 0 0
Wilkes and Co., Ltd.* ... 337 0 0
*Recommended for acceptance.

QUEENSTOWN.—For the construction of an outfall sewer at Queenstown, for the urban district council. Mr. P. H. M'Carthy, B.E., 39, Westmoreland-street, Dublin, engineer:—
Fitzpatrick, J., Kanturk ... £670 0 0
Collins, D., Cork (accepted) ... 523 0 0

SAFFRON WALDEN.—For making-up new road, for the corporation:—
Custerson, J. (accepted) ... £133 0 0

SCARBOROUGH.—For heating and lighting alterations at the workhouse, for the guardians. Accepted tenders:—
Brightside Engineering Co. ... £4,841 0 0
Jaram ... 1,123 0 0

SOUTHBOROUGH.—For painting and repairs required at the Southborough Council School, for the Kent Education Committee. Mr. W. H. Robinson, M.S.A., architect:—
Stokes and Son ... £377 0 0
Harmer and Holt ... 194 10 0
Carrick, J., Ltd. ... 175 0 0
Parker, A. J. ... 168 15 0
Pankhurst, P. F.* ... £168 0 0
*Provisionally accepted.

SITTINGBOURNE.—For council school summer repairs, for the Kent Education Committee. Mr. W. H. Robinson M.S.A., architect:—
Monk, T. ... £221 0 0
Tidy, H. J.* ... 178 0 0
*Provisionally accepted.

STURBITON.—For drainage of the cemetery site, for the urban district council:—
Limpus and Son, Kingston Hill ... £1,913 0 8
Lingwood, W., Jun., Romford ... 1,583 10 0
Road Maintenance and Stone Co., Ltd., Cannon-street, E.C. ... 1,533 6 2
Wood, T., and Sons, Swanley ... 1,625 16 3

SOUTH KYME.—For the South Kyme water supply, for the Sleaford Rural District Council:—
Emery, Aston ... £1,639 0 0
Williams and Co. ... 1,360 0 0
Leggott and Speight ... 1,347 0 0
Lansley, Kirton ... 1,249 0 0
Sykes, A., Nottingham ... 1,140 8 0
Blaze, W., Sleaford ... 1,086 0 0
Banks, J. J., Sleaford ... 1,071 0 0
Pattinson and Son ... 1,065 0 0
Barnes, J. T., Sleaford (accepted) 1,030 0 0

SWANSEA.—For supply of switchgear, for the corporation. Accepted tenders:—
Main generating station switchgear:—
British Westinghouse Co. ... £1,377 0 0
Sub-station switchgear:—
Ferguson, Pailin, and Co. ... 547 0 0

TETBURY.—For sinking a new well, for the urban district council:—
Johnson Brothers (accepted), as per schedule of prices, estimated at about £750.

TIPTON.—For the conversion of existing closets at the Tipton Green and Ocker Hill Council schools into water-closets, and connecting same to the main sewers, for the education committee. Mr. W. H. Jukes, surveyor:—
Jackson, C. ... £276 12 9
Edwards, J., Dudley ... 258 9 9
Sisman, J. ... 250 0 0
Kendrick, W. A. ... 239 17 10
Bennett, E. and W., Ocker Hill* ... 225 0 0
Engineer and surveyor's estimate, £260.
*Accepted. Rest of Tipton.

TIPTON.—For making-up, sewerage, kerbing, and channelling and paving of footpaths in Leech-street, Horseley Heath, Tipton, for the Tipton Urban District Council. Mr. W. H. Jukes, M.E., surveyor:—
Kendrick, W. A., Tipton ... £217 8 8
Edwards, J., Dudley ... 167 17 5
Guy, W. F., Tipton ... 158 14 6
Jackson, C., Tipton (accepted) ... 158 8 5
Engineer's estimate, £157 11s. 10d.

TURTON.—For construction of overhead lines and underground cables, for the urban district council:—
Dewhurst Engineering Co., Ltd., Sheffield ... £2,354 5 0
Siemens Bros. and Co., Ltd., Woolwich ... 1,749 0 0
Callender's Cable and Construction Co., Ltd., London ... 1,725 3 6
Western Electric Co., Ltd., North Woolwich ... 1,720 0 0
Glover, W. T., and Co., Ltd., Trafford Park ... 1,691 9 3
Johnson and Phillips, Charlton Henley's, W. T., Telegraph Works Co., Ltd., London, E.C. ... 1,655 0 0
British Insulated and Helsby Cables, Ltd., Prescott* ... 1,588 7 10
*Accepted.

UTTOXETER.—For painting and redecorating the interior of the town hall, for the urban district council:—
Ward and Godbehere (accepted) £108 0 0

WANSTEAD.—For the Aldersbrook-road improvement, for the Wanstead Urban District Council. Mr. C. H. Bresser, F.S.I., surveyor:—
Widening:—
Jackson, W., Forest-gate ... £1,300 0 0
Blaker, Leatherhead ... 1,274 16 0
Adams, T., Wood Green ... 1,258 2 10
French, W. & C., Buckhurst-hill* 1,165 10 6
Anderson, G. J., Poplar ... 1,151 2 5
Jackson, D. T., Barking ... 1,074 0 0
Resurfacing:—
Limmer Asphalt Co., Westminster ... 4,010 6 0
Highways Construction Co., Finsbury-pavement ... 3,459 17 4
Smith, H. V., and Co., Victoria-street, S.W. ... 3,420 11 0
Blaker, S.W. ... 2,594 18 0
Roadman Co., Ltd., London-wall, E.C. ... 2,712 17 0
Tarmac, Ltd., Westminster* ... 2,712 17 0
*Accepted.

WEDNESBURY.—For the erection of an ambulance shed, for the corporation. Mr. E. Martin Scott, borough surveyor:—
Bradbury, T. ... £98 15 0
Summerhill and Jellyman ... 98 0 0

*Accepted.

YALDING.—For the rebuilding of Pike Fish Bridge, Yalding, for the Maidstone Rural District Council:—
Burrows, W. T., Maidstone ... £358 0 0
Stanley and Co., Marden ... 196 10 0
Martin and Newman, Maidstone* 127 0 0
*Accepted.

TO CORRESPONDENTS.

We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.

It is particularly requested that all drawings and all communications respecting illustrations or literary matter, books for review, etc., should be addressed to the EDITOR of the BUILDING NEWS, Elingham House, 1, Arundel-street, Strand, W.C., and not to members of the staff by name. Delay is not infrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

When favouring us with drawings or photographs, architects are asked kindly to state how long the building has been erected. It does neither them nor us much good to illustrate buildings which have been some time executed, except under special circumstances.

* Drawings of selected competition designs, important public and private buildings, details of old and new work, and good sketches are always welcome, and for such no charge is made for insertion. Of more commonplace subjects—small churches, chapels, houses, etc.—we have usually far more sent than we can insert, but are glad to do so when space permits, on mutually advantageous terms, which may be ascertained on application.

Telephone: Gerrard 1291.
Telegrams: "Timeserver, Estrand, London."

RECEIVED.—A. Ltd.—E. and R., Ltd.—B. of S.—J. G. K. and Son.—W. H. S. and Son.—T. T. G. and Co.—J. C. S.—R. T. L., Ltd.—C. T. and Co.—M. and Co., Ltd.

ROVER.—No.

F. T. L.—Please send.

FRID.—Yes, if brief.

W. JOHNSON.—English. See our back page this week.

NORTHERN.—If the building is constructed on their system, we certainly think you require a license.

H. P. GREEN, A. Claymore, W. Benwell, and others desirous of having their free situation advertisements repeated will kindly note that the advertisement must, in all cases, be sent. We have no time to hunt up previous issues.

F. W. M.—The principal shareholder is a German. Quite apart from possible penal consequences to himself, a British architect or engineer who at this time uses German systems or goods is certainly exposing his clients to considerable risks.

UNCERTAIN.—If you owe any accounts to German firms certainly do not pay them, at any rate while the war lasts, as you will only be financing the King's enemies. Leave them to their legal remedy. Note a case at the City of London Court on Wednesday, where a German was not only non-suited, but his court-fees were retained by the Assistant Registrar. Note also Mr. Justice Shearman's decision in the Vacation Court the same day, to which we refer elsewhere.

LIST OF COMPETITIONS OPEN.

Sept. 7.—Designs for Public Elementary Schools at Linda-street, York-road, Battersea; and Billingsgate-street, Church-street, Greenwich. (Mr. J. W. Simpson, F.R.I.B.A., Assessor) ... L. Gomme, Clerk, Education Offices, Victoria Embk., W.C.

.. 15.—Designs for Shakespeares Memorial National Theatre (Mr. T. E. Collcutt, P.P.R.I.B.A., Assessor) ... 500gs. (merged), and five of 150gs. The Secretary, 3A, Dean's-yard, Westminster Abbey, S.W.

Oct. 14.—Technical Schools and Education Offices, Southport (Mr. Paul Waterhouse, M.A., F.R.I.B.A., Assessor) ... £75, £50, £25 ... T. E. Jarratt, Town Clerk, Town Hall, Southport.

.. 31.—Laying Out Show Grounds, Wayville West, Adelaide ... £500, £200, £100 ... The Secretary, Royal Agricultural Society of South Australia, 23, Waymouth-street, Adelaide.

.. 31.—Drawings for Police Buildings and Fire Station, St. Helens. (Assessor) ... £100, £50, £25 ... A. W. Bradley, M.I.C.E., Town Hall, St. Helens.

Dec. 31.—Planning Workmen's Settlement, Campine Coalfield ... £400, £240 ... M. le President de la Commission pour l'Amenagement de Agglomerations Industrielles, Rue de Louvain, Brussels.

o date.—School (600 places), Vale-road, South Tottenham ... W. Mallinson, Clerk, Phillips-lane, South Tottenham.

LIST OF TENDERS OPEN.

SELLING AND LETTING HOUSES.

The best business for a builder when a house is finished, is to sell it, and to sell it at once, while hot, as they say. Fresh in its paint and papering, new and beautiful, with the bloom on it. For, in our climate, the freshness, newness, and bloom only too quickly go off and pass away. In the good times houses were so sold, like hot cakes, long before they were finished, and often when they had been but just begun. The builder is always himself his own best agent, whether for selling or letting. No one else has so keen an eye for a likely buyer, or so clear a view of a probable tenant. He knows the points of his property, and he is artful as to the ways of women. For it is always the lady who, in the end, really decides whether a house shall be bought or taken. It is usually quite easy to talk round a mere man. Appeal to him as one who knows the world and the City; run off a few figures, show him what looks like a good bit of wood-work, and the thing is done. Then the wife, or the intended, comes along, and other means have to be used. The price asked does not touch her, nor the rent, if it is a letting. It is rather the rates or taxes and the chimneys and cupboards as facts, to which she gives her close attention. The builder who has fitted in cupboards in all possible corners, and made the kitchen as full of lockers as a cabin, has his reward when the masterful woman comes round to see if the plans will do. Then there are pretty stoves, and blue tiles, occasional bits of fretwork anywhere, that have been known to work wonders with the artistic temperament of many ladies.

But although the builder's object is, and must be, to sell his houses as soon as possible, and so enable his financier to turn the money over quickly, and lend it out to him again, there are many properties that are not readily sold, and have to be let. These are the larger desirable detached or semidetached residences, with ambitious elevations, or varying gabled roofs, a wonderful bay, or square windows. These are not so often sold red-hot, though when they are, it is the very best business. Men of the upper middle class are not so fully persuaded of the advantages of owning your own house as are those lower down the social scale. They know more about it. They have friends who, in the slang of the day, have "had some," and are now, as it were, hung about with houses bought in the days of a trade boom which are not now worth the money for which they have been mortgaged. So these comfortable, if not commanding, villas have to be let on the best terms possible,

while new, by their enterprising builder. It is here that fashion comes in with its inscrutable decrees. A suburban locality is suddenly found to have sprung into the limelight of popularity. Then there is a good harvest for the bold builder who sells what he can, and lets the rest on repairing leases. The thing wants doing well. One point is to bring out clearly that Sir Somebody has just bought the corner house, while a certain retired General or Admiral has taken one on the other side. This gives a character to the "Gardens" or "Avenue" which no mere building or decoration could ever confer, and is especially fetching with the best ladies!

The points of the house itself are also of great importance. For instance, there is the carriage-drive with two gates, which works all right, with care, and is quite safe for a Bath-chair. Then there is the Garage, which should always be printed red in any particulars. Now, this garage has done wonders of late years. It really seems to modernise a house which has already passed its prime. "Of course you will want a garage?" says the builder to a likely tenant, whom he sums up with one glance of his eye. "Oh, of course," answer man and wife emphatically together, though the motor-car is still a hope in the future. Then the garage, a plain red brick building, run up by the builder on his own simple and cheap plan, does the trick and binds the deal. The parties may all know that, for the present, at least, it will be used as a toolhouse, with garden-hose, roller, bicycle, and perambulator complete. But that is nothing: there is the garage, and in these days it is as certain a sign of respectability as keeping a gig was said to be in former times. Where this essential of modern life does not actually exist, a builder or agent who has to let the house promptly promises to put one up, and does so "while you wait?"

In many places old-fashioned gardens have come into fashion, and an enterprising builder who picks up an ancient cottage with a really large piece of land round it, may make money. If the cottage be enlarged, and its character kept by not being over-modernised, a very decent dwelling can be put together. There must, of course, be extensions and additions in the same style of Domestic architecture; but this can be done under proper guidance. Inside there will have to be proper sanitation, bathroom, etc. There must also be added to the primitive structure a good many bedrooms. But the whole job need not cost much, and if a suitable plan is well carried out, the result should be effective and successful. Where the place is in a pretty countryside, a

really charming home may be put together. Here again there will, of course, be a garage for a car to take the occupier into town and back again. Still, the old-fashioned garden, especially if it has a fair lawn, some fruit-trees—either standard or growing on a solid old wall—is generally the best point in such a property. It pleases the ladies, and its age gives an air of ancestry to the whole place. An orchard is also a great asset in such cases, and if an old well can be discovered, and got up with some antique stone, it will be an added distinction. An old sundial, put in the proper place has been known to work wonders, and a green pond, with a legendary pike, goes far to sell such premises. Architects know very well how to transform a broken-down cottage into a straggling country house. Gables anywhere are good, and a Gothic porch with side seats is almost essential, whatever may be the general style. So completed, and made quite correct and comfortable inside, we have the "little place in the country" that women love and that men like to talk about. It does so well for bringing down a few friends for the weekend in the motor-car, and the garden and country round about are, of course, "so good for the children."

Properties of this kind can either be let or sold, with proper and tactful pushing, and good profits may be made either way upon the original price of purchase and cost of the improvements. But there are other classes of houses which are only suitable for selling. Indeed, they are built upon that basis, and one condition of their working out well financially is that they shall be sold soon, and at all events before the inevitable and expensive repairs have to be incurred. These properties are to be found in most modern suburbs, whether Metropolitan or provincial. They are usually villas, either semidetached or in terraces. There must be a pretty front, or, as some would say, an elegant elevation. Stone facings and trimmings are important, and so are bay windows. They generally appeal to the saving young man—clerk or the like—especially if about to be, or only lately, married. These are the people who still believe in the policy of buying a house for occupation. As they get older, they are apt to find out that, as an economic principle, there is not much in it. But the idea of not having to pay a yearly rent, say, of £35 controls their financial view of the transaction. So they purchase the leasehold through a building society, to whom the builder introduces them in the most friendly manner as being sound and reliable. To be sure, there is the ground-rent of about £5, and the monthly instal-

Messrs. HOMER and LUCAS, Architects.

ments to the building society, which look easy enough, in the future. So, say, with £50 down, they become owners of their pretty, brand-new houses. The husbands and wives talk lightly of "our own house, you know," and all is well—for a time. If, however, the monthly payments to the society are not always ready, trouble comes. If they want to sell, it is found that cash values are strangely low; to which is added the queer way building societies have of keeping their accounts. For when it is proposed to redeem one of these mortgages, it really looks as if nothing much had been paid off, although many months' instalments may have been punctually met. This, of course, is owing to the interest for the whole term having been added on to the actual sum advanced. It is indeed quite surprising to see how difficult it is to get it off, and how much of it still has to be paid at the completion.

There is another line in which some enterprising builders have been doing pretty well. This is in the transforming a large, out-of-date house into two compact and convenient flats, or, more prettily, mansionettes! There are streets of houses in the West End, and elsewhere, which were built for big families and high rents. "Commanding residences," with front steps and stone portico, breakfast-room, and basement all complete. What is to be done with them? The owner, or often the mortgagee in possession, gets tired of seeing them empty, and of paying the heavy ground-rent. A brisk builder comes along, buys some cheap, and sets about the work of transformation. By neat adjustment the trick is done. There are two entrances, with separate halls to the upper and lower flat. Then they are let at good rents, including all rates, taxes, and water, and a losing property is turned into a paying speculation. To be sure, some of the rooms seem to be too large and lofty in their way, and the seeing eye can judge of what has happened. But the hall-house has a good address, and is quite of the West End, and so they go off fairly well. The cost of sanitary changes and another kitchen, etc., is not heavy to a builder who knows his way about, and the tenants who take such places are so charmed with the inclusive rent, and the name of the road on their notepaper, that they bring in a good return for the first outlay.

In letting houses where a lease of 7, 14, or 21 years is taken up, the tenants usually get some legal advice, and are fairly safe. But in regard to the smaller class of new dwellings, the builder generally has his own printed agreement. It is quite plain and simple, and very neatly got up. You just fill in the names and the term—say of three years, then it is signed, and the transaction completed. Nothing is said about repairs in the document, or by the builder. Now, although the law of landlord and tenant is the very oldest law of the land, coming down to us from Feudal times, the popular ignorance about it is entire and amazing. There is a general and pervading impression that a landlord must repair, anyhow, the outside. Yet, legally speaking, a landlord who has not agreed to do so is not liable for any repairs whatever. Some builders carry this to extremes, and do nothing; others sell the house as soon as it is well let. But, of course, many owners of property who want to retain tenants find they must keep the premises in fair repair. There is one small point about these simple little agreements which often causes confusion to the unwary. A house may be let, as the printed form plainly provides, for the term of "one year certain, and so on from year to year." This looks innocent enough; but it means a letting for two years, at least. The effect of these artless words is, in law, that, at the end of the one year certain, a yearly tenancy begins, which can only be ended by six months' notice expiring at the end of the second year. From this it follows that, if the proper date for giving this notice is overlooked, the letting goes on for a third year. This is a matter of every-day occurrence. The law as to yearly tenancy has existed as it now is for some centuries, and yet there is still no more common error made in legal matters than about this question as to the proper mode of ending a yearly tenancy.

SELECTED DESIGN FOR THE HOUSING SCHEME AT POTTON, BEDS.

As we announced last week, the Biggleswade Rural District Council has decided upon the plans submitted in the late competition, and have chosen those prepared by Messrs. Homer and Lucas, architects, of 62, Oxford-street. Other cottages to be built at Sandy and Beeston will correspond in

character and plan. Their scheme has been approved by the Local Government Board. The site has a frontage in Horselow-street, Potton, and the high-road curves round in front of the property on its way to Gamlingay. In the opposite direction it leads to Everton. A cross-set cart-road is laid down in a straight line through the land to give good access, and at right-angles a central path also communicating with the back of the garden allotments laid out behind the thirty-six cottages, and making the most of the available space thus enclosed. Some of the gardens measure 139ft. by 17ft. 6in.; others work out at an average of about 82ft. by 26ft., while a few scale 93ft. by 31ft., these last dimensions being next to the cottages facing the curved frontage at the extremity of the site. There is a private road forming an approach to the dwellings on one side of the property, and it has a turning-round space at the termination of this cul de sac. All the cottages correspond in design. The lighting depends upon rear and front windows, in order that these blocks of four dwellings may be placed very compactly together. Each tenement is contrived so as to allow of an economical arrangement in their disposition as a whole, and the out-buildings are devised so as to accommodate this repetition arrangement. The height of the rooms on both floors is 8ft. from floor to ceiling, and each block measures 60ft. 6in. from out to out. The plans given herewith show both floors, and thus fully illustrate their design, while the elevation of the cottages shows how red brick is employed for the walls of the ground stage, the walls above being roughcasted, with brick quoins at the angles. No expense has been incurred on ornament of any kind.

LOUVAIN AND MALINES.

Hundreds of our own readers have the pleasantest memories of Louvain and Malines, where the German armies have set themselves to rival Attila and his Huns, and the later atrocities of the Duke of Brabant. One—perhaps vainly—hopes that the stories of massacres and destruction are exaggerated, and that the pleasant towns, which have few rivals in Europe in interest, may once again rise from their ashes and regain their prosperity.

In the 14th century, while as yet Brussels was little more than a third-rate city, Louvain was the capital of Brabant, with a population, it is said, of at least a hundred thousand inhabitants, whose chief source of employment was clothmaking, its guild of weavers alone numbering two thousand

members. Jealousy of the growing power of the trader citizens on the part of the nobles led to broils, which culminated in 1379 in the massacre of seventeen magistrates and nobles, who were thrown from the windows of the Hotel de Ville and impaled upon the

spears of the populace. Then the heavy hand of the Dukes of Brabant fell upon the city. Multitudes of the weavers were driven from Louvain. Thousands went to Holland; many found their way to England, and there established their handicraft. Duke Wenceslaus

nearly made an end of the manufacturing activity, but another Duke—Duke John IV.—started the city on a new career as a centre of learning. He founded its University in 1423, and from that date Louvain has been the chief seat of Belgian collegiate life. Since

1679 the University has been lodged in the old Clothmakers' Hall, a building dating from the early part of the 13th century. It had suffered from the hand of the restorer, but retained untouched the work of the old builders in the ground story.

The more beautiful monument of the labours of the Mediaeval craftsmen, the Hotel de Ville, was built between 1448 and 1463, under the charge of the master mason, Matthieu de Layens. Each of the three stories of which the building consisted contained ten canopied windows, while the space between them was covered by decorated niches filled with sculptured figures, some of historical personages, others of allegorical figures. In all there were more than 250 of these statues, each in its decorated niche. The corners of the building were crowned with octagonal turrets, terminated in pinnacles decorated with carving. All this has been ruthlessly destroyed by one of the Kaiser's commanders in a moment of passion to cover the blunder of his own men.

Gone, too, is the Late Gothic church of Saint Pierre, begun in 1425, and finished a century later. The interior of this church was lighted by ninety large windows, and it contained many examples of the carver's art—notably the organ, dating from 1556, and the pulpit, wrought in 1742 by Bergé, with its representations of the Denial of St. Peter and the Conversion of St. Norbert—as well as numerous Mediaeval paintings, among them a Last Supper, by Dierick Bouts, painted about 1467. There was also the Tabernacle, 40ft. high, executed in stone in 1450 by De Layens, the builder of the Hotel de Ville.

Besides these buildings, Louvain possessed the Church of St. Michael, erected in 1650 by Faid'herbe, a fine example of Belgian Baroque; of the Church of St. Jacques, dating from the 15th century, with its Gothic tabernacle wrought by Van den Bruyne in 1538; and the Church of St. Gertrude, the oldest of them all, begun in the 14th century, and added to in the 15th century.

Nor is it only in Louvain that these precious relics of the past have been, or are being, destroyed. In their bombardment of Malines on Thursday week the Germans did much damage to the Cathedral of St. Rombold there, a building whose beginning dates from about the year 1290, and destroyed its famous peal of bells, while it is stated that they wholly destroyed the Hotel de Ville and the Church of St. Pierre.

Our own past volumes teem with illustrations of Belgian art. Among them we may mention those at Louvain of a Panel in St. Gertrude's Church, Dec. 6, 1895; Sketches of the Cathedral, May 31, 1895; Church of St. Jacques, Nov. 22, 1889; The Wrought-Iron Lock in the Church of St. Pierre, June 8, 1881; South-East View of the Church of St. Pierre, April 9, 1886; Turret of the Church of St. Pierre, Feb. 6, 1885; and Gables in Half Maart-street, Dec. 22, 1882.

Of work at Malines will be found: Gables of Windows, Aug. 2, 1907; Sketches of the Palais de Justice, and others, Nov. 2, 1900; Grand Place, July 30, 1897; Quaint Flemish Houses, Oct. 12, 1894; Plan of the Cathedral, June 9, 1893; Convent des Carolites, Aug. 21, 1891; Church of Notre Dame, Nov. 22, 1889, and May 22, 1891; a Fleche, March 30, 1888; Houses in the Grand Place, April 9, 1880, and The Market Hall, Dec. 19, 1879.

OLD BEAUPRÉ, GLAMORGAN.

[WITH ILLUSTRATIONS.]

Beaupré Castle or, rather, Old Beaupré, as it is commonly called, to distinguish it from the more modern residence, New Beaupré—is pleasantly situated in a well-wooded district, and occupies a strong natural defensive position on rising ground, overlooking the River Thaw, near Cowbridge, Glamorgan, the river curving gently as it approaches the castle.

The South of Wales is thickly studded with castles, the majority of which are in ruins, having for the most part been built in Norman times; but Old Beaupré is much

later, the greater portion of it having been erected during the reign of the Tudors.

There is nothing particularly attractive about the Castle, which is now a picturesque ruin, except the beautiful Renaissance porch and entrance gateway, which are both in an excellent state of preservation, and are objects of considerable interest both to the architect and archaeologist, having several times been visited by the chief archaeological societies of England and Wales. The porch is of exceptional interest, and will bear favourable comparison with some of the best examples in England, except, perhaps, such samples as the porch of Kirby Hall, the details of which are more refined, and which is superior in general proportions. The cornices, carving, and heads at Beaupré are in an excellent state of preservation, the majority of the mouldings being as clean as the day they were first worked. Gwilt, in his "Encyclopædia," describing English Renaissance architecture from James I. to Anne, says: "The use of the Orders became more general. In Glamorganshire, at Beaupré Castle, which has a front and porch of the Doric Order, we find a composition including that just named, the Ionic, and the Corinthian, wherein the capitals and columns are accurately designed and executed."

The porch is square on plan, and stands out its full length from the front wall of the Castle, measuring about 9ft. by 9ft. internally, and 36ft. in height from the ground line to the top of the pediment. The proportions and detail of the ground-floor story are excellent; but the upper portion is not so satisfactory, the mouldings and detail lacking boldness, and the composition as a whole not being altogether of equal merit. A four-centred Tudor arch forms the main entrance, and at the back a similar arch is employed, the spandrel and the lintel over the head being relieved with shields. The door itself is of oak, strongly studded, and hung with ornamental wrought-iron hinges, whilst the internal faces of the wall are of stone, the vertical and horizontal joints being rebated and sunk.

The arms of the Bassett family, together with their alliances, are represented on the shield in the panel on the first story, and under the same is the well-known inscription, spelt, "Gwell angay na Chwilydd"; but this is incorrect, and should be "Gwell angau na Chwilydd," meaning, "Better death than dishonour," this being the motto adopted by one of the Welsh regiments.

Immediately above the lower cornice are three carved panels in line, with the inscription cut in Roman letters, without capitals, and reading as—

SAY, COWLDST THOV E
VER FYND OR EVER HEA
RE OR SEE WORLDLY WRET
CHE OR COWARD PROVE

A FAYTHFVLL FRYNDE
TO BE RYCHARDE
BASSETT HAVING TO WYFE
KATHERINE DOUGHTER TO

SIR THOMAS JOHNS KNIGHT
BWYLT THIS PORCH WITH
THE TONNES IN ANO 1600
HIS YERES 65 HIS WIFE 55

Various surmises have been made as to the meaning of the word "tonnes," some persons reading it as towers; but it has been translated by one authority as meaning wedding dowry.

In all probability the space between the mullions and transom on the second floor, which are now blocked up, was at one time filled in with leaded lights, and it is also certain that the circular panel under the pediment was originally intended for a clock; but whether one was ever placed there is not by any means clear. The whole of the

mouldings, ornament, and details of the porch are based upon the Italian Renaissance in design, with the exception of the four-centred arch and the Tudor Rose, the latter of which is used in one or two cases in the frieze above the columns.

Over twenty years ago this porch was in a very precarious condition, and would certainly have fallen but for the timely efforts of the present representative of the Bassetts, who went to considerable expense and trouble in renovating the structure and putting the masonry in a sound structural condition.

The entrance gateway is not such a fine piece of work as the porch, neither in size nor design, some of the detail being, in fact, very commonplace. It is of much earlier date, having been built about fourteen years anterior to the erection of the porch. Over the cornice, above the Tudor arch, is a shield enclosed in a panel, with fluted pilasters at either side, and it contains the Bassett arms as well as the family motto, "Gwell Angay na Chwilydd"; but this, again, is not correctly spelt, and should be as previously stated.

Immediately below the upper horizontal cornice and in the centre above the panel is the date 1586, enclosed in an Ionic cap, and on the right-hand side are the initials "R. B.," while on the left hand occur the initials "C. B.," "C. B." These, however, are very indistinct and almost obliterated. In what is presumed to have been the banqueting hall is a large fireplace deeply recessed, with a flat stone head 2ft. 3in. deep, panelled and filled in with shields, the whole surmounted with a string mould of Classic profile, while the mouldings of the jambs are Late Gothic.

There are very few other interesting features about Old Beaupré, with the exception of a cusped pointed window in the gable end of one of the farm buildings attached to the Castle. One of the rooms, occupied by a caretaker, is, however, finely panelled in oak. Some Welsh genealogists affirm that Old Beaupré once belonged to Systylyt, ancestor of the Ceceils, and state that John Systylyt, son and heir of Robert Systylyt, sold Maes-Essylyt, or Beapré, the principal manor of St. Hilary, to Philip Bassett after the Battle of Lincoln in 1140, to pay his ransom, being taken prisoner there. Other accounts marry the Systylyt heiress to Adam Tuberville, and their heiress to Bassett; but all this depends upon very fragmentary evidence.

In many of the manuscript pedigrees of the Bassetts it is said that Sir Phillip, Lord of St. Hilary and the first of the family at Beaupré, was the person who originally arranged and drew up the copy of the Magna Charta, which King John was obliged by the barons to sign in Runnymede, and that many of these worthies met at Beaupré to assist in this plan and the arrangements adopted for its execution.

Sir Phillip Bassett was Chancellor to Robert Fitzroy, Lord, or Prince, of Glamorgan, and as he held this office about the time of King John, there is some likelihood that this account is trustworthy, and as the signing of Magna Charta was so great an event in the history of England, it is not at all surprising that some mention of such an important episode should be handed down from generation to generation in this family's records.

The perspective sketch of the porch here given was awarded the first prize at the Royal Welsh National Eisteddfod for the best drawing in black and white of any antiquarian object of interest in Wales.

W. EATON, A.R.I.B.A.

The new bridge over the Hellgate Inlet at New York now under construction will have the largest span of its type in the world—that of a cantilever, anchored to counterweights. The span of the arch is 117ft., 307ft. high from water-level, with two-hinge trusses 143ft. deep. The width is 193ft., so as to accommodate four railway tracks. The lower chords of the spandrel-braced two-hinge arched trusses, 60ft. apart on centres, are parabolic curves with a rise of 220ft. and a span of 117ft.

CEMENT JOINTS IN SEWER-PIPE.

The following contribution is submitted to the *Engineering News* by Mr. W. S. Lea, the Montreal consulting engineer, who writes:—

I have had some experience with cement-mortar joints made in three different ways: (1) where a gasket was not used; (2) where a gasket was inserted against the shoulder of the bell in the usual way; (3) where the gasket in the finished joint was at the entrance to the bell all the way round, caulked flush with, or a little inside the outside edge of the bell. In all cases, the bottom third of the bell was lined with mortar before inserting the pipe. When no gasket was used, pipe 12in. and over was centred by two small wooden chips. These chips were also used with the gasket in laying the larger sizes, 18in. and over. Ordinarily, no difficulty was experienced in centring the 8in. and 10in. pipe without chips, whether a gasket was used or not. In every case the joints were pointed from the inside for all pipes 15in. and over. In methods (1) and (2) the joints were protected with a burlap or cheesecloth band for pipe 18in. and over.

So far as my experience goes, I am of the opinion (1) that the lower part of the bell should be filled before the spigot of the succeeding pipe is entered, and with more mortar than is needed in that part of the joint; for safety the mortar should appear on the inside; (2) that it is important to use a gasket, not only to assist in centring the pipe, but I believe that the clogging, or slitting up of a gasket caulked tightly into the bell is a considerable factor in preventing leakage in either direction through the joint, where the cement mortar itself is defective; (3) that while no doubt it can be dispensed with, it is safer to use chips to prevent the larger pipes settling at the spigot end; (4) that while it is proper to give the joint a finished appearance by a moderate bevel, the so-called generous bevel is, if anything, worse than useless with the larger sizes, as it tends to sag away from the sides of the pipe; (5) that with the larger sizes, the joint should be supported by a strap of burlap, etc., unless a gasket is inserted at the face of the bell after the joint has been filled up the sides and over the crown.

Moreover, the third method of joint-making has appeared to insure the tightest work so far as I have seen it used. This joint is made by lining the bottom third of the bell in the usual way, covering the gasket, which is placed along the outside edge of the bell. The gasket is long enough to encircle the pipe, and the two end sections are brought out of the bell after passing clear of the mortar in the bottom. The spigot end of the pipe is then entered with its crown guided against the bell, worked down to centre at both ends and bedded. After the joint has been completely filled with mortar, the free end sections of the gasket are caulked into the bell working from the bottom toward the crown. The gasket is driven flush with, or a little within, the face of the bell, the bevel applied, the joint pointed on the inside where accessible, and the surplus mortar cleaned out. There is not very much mortar driven through, particularly with the smaller pipe.

This feature of the mortar forcing through is occasionally objectionable in a way that is hard to avoid. The 12in. pipe and under cannot be pointed from the inside, and if, as sometimes happens, the plane of the spigot end is not perpendicular to the axis of the pipe, there may be a considerable space at the crown of the joint between the spigot end and the shoulder of the bell; and the mortar filling this space sometimes drops to the invert after the pipe-laying has proceeded some distance in advance.

When laying 12in. pipe, this feature has to be watched; it rarely happens with 8in. pipe, or with the larger sizes where the joints have been pointed from the inside. With the joint made in this way the mortar is firmly held in the bell, and even if the bevel does

sag, it cannot carry the mortar out of the bell with it.

I have not found the chips objectionable in the way Mr. Begg suggests; perhaps more mortar was placed in the bottom of the bell; at any rate the chips did not keep the pipe off the mortar; they were practically buried in it, near its upper edges. The chips were placed in this position so that they could be easily moved a little higher, or lower, when occasionally required; moreover, with the chips in this position, any inequalities in either the pipe or the chips do not raise or lower the spigot end so much as if the chips were placed lower down, opposite a diameter approaching the vertical. However, there is no doubt that with the chips omitted, the gasket will generally be fitted tighter in the bottom, and that is a desirable feature.

The consistency of the mortar is an important matter, and not at all easily controlled. The tendency is to have the mortar too soft, as it is easier for the pipe-layer to handle. Unless quite stiff initially, the mortar which has been hurriedly mixed becomes sloppy on further handling, and cannot be easily compacted or retained in the bell. The man who mixes the mortar often has too many other things to look after. The mortar should be mixed in very small batches, and kept thoroughly stirred some time before being used. This permits the mixture to absorb more water, and the proper consistency can be better gauged by the mortar man as further handling does not affect it; moreover, the mortar appears to be tougher, and works smoother.

Mr. Begg has adopted a good specification at Edmonton. Clause (e) which specifies that no joint is to be completed until at least two joints have been bedded and graded in advance is to be particularly recommended. In reading his well presented article, I had hoped to find the detailed description of the work extended to include the method or the procedure followed in bedding the pipe. It is in connection with this that the most serious difficulties arise in laying sewer-pipe. It requires considerable skill and patience to bed a pipe firmly, and at the same time have it lying true to grade and alignment. It is true that once the pipe is in the right position it can be held and supported by tamping proper filling around it with a thin-bladed tool. In this operation lies the greatest risk of lifting the spigot end slightly from the mortar in the bottom of the bell.

It has been the writer's practice to defer tamping immediately around the joint until after the mortar has set up; but in bright, hot weather, at least, the joints were covered with loose earth. Before back filling the trench the following day, some of this filling was removed, before the tamping was completed. Possibly this was not a good system; care certainly had to be taken to maintain the compacted filling at the same level on both sides of the pipe, so as to avoid jarring it slightly off the line. It is surprising how easily this can be done with even a very light tamping-iron.

MANUFACTURE OF CEMENT FROM SUGAR BY-PRODUCTS.

The Canadian Trade Commissioner at Leeds (Mr. C. Dyer), in a report submitted to the Dominion Government, draws attention to the fact that, in European countries where sugar beet is grown, a systematic study has of late been made by beet factories as to ways and means of utilising the by-products. One successful method of using waste matter is said to have been perfected by a French firm. In the process of sugar-boiling—in the early stages of the refining process—a considerable amount of seum is produced. This is bulky, and partakes somewhat of the character of molasses; however, it is not rich in saccharine matter, but, on the contrary, contains chiefly water and lime in the form of carbonate. Hitherto this seum has been useless; but, having regard to the fact that carbonate of lime can be reduced to its crystalline form, when it becomes very fine powder, it was thought it might be found valuable in the manufacture of cement.

It has been shown that out of 70,000 tons of beet treated for production of sugar, 9,000 tons of seum is produced, which leaves a solid residue of 4,000 tons, 5,000 being moisture and saccharine. To this 4,000 tons of carbonate of lime, 1,100 tons of clay is added. This gives the primary bulk of 5,100 tons, and when this raw material has been treated 3,162 tons of excellent cement results.

The method of procedure is approximately this. The seum is pumped from the sugar boilers into large tanks; it is then in the form of a viscous mass. This is allowed partly to dry in the tanks, when the clay is finely divided, and this or powdered schist is added. The mixture is then run into special receptacles with beating mixers, where it is amalgamated for about an hour. Samples are then taken, and any deficiency of lime or clay is made good, and the process goes on until a satisfactory mixture is obtained. Then the mixture passes by means of continuous belts to a rotary furnace which is lined with refractory bricks. Some economical method of heating the furnaces must be effected in order to reduce the cost of production.

The burning of the cement is a comparatively short process, though it is one of some nicety, as the process must not be carried too far. When sufficiently burned the clinker is removed from the furnaces to pulverisers, where it is reduced to as fine a powder as possible. As above stated, there is a loss of nearly 2,000 tons out of 5,000 tons, this being represented partly by moisture and partly by irreducible solids. These, however, may be utilised for rough mortar. The cement is found to be well appreciated on the market and to fetch a fair price. The process is stated to be a mere manufacturing one and not a patent, and the plant necessary for such manufacture is not elaborate or costly.

BUREAU OF STANDARDS FURNACE FOR TESTING BUILDING MATERIALS.

What is said to be the most efficient furnace for the testing of the fire-resisting qualities of building materials ever constructed in this country is being completed by the United States Government at the Pittsburgh, Pa., station of the Bureau of Standards. It is also to be used for load-testing under immense heat. The furnace is in the form of a parallelogram, and is built of firebrick, two big piers of solid brick taking up the lower part of the interior. There is an ingenious system of flues, the heat being applied by burners in which natural gas, mixed with compressed air, is burned. One side of the enclosure is open, and here a panel 8ft. by 6ft. is built up of the material which is to be tested, the panel, held in an iron frame suspended from I-beam travellers, forming, in fact, the other wall of the furnace. By suspending it the panel may be moved away from the furnace and tested for the action of water, which is sent against it through a hose of several streams.

A feature of the work will be the testing of safes and filing cabinets to see whether papers contained in them are damaged by fire. Any manufacturer may send such objects and have them tested free, if such testing is in line with the work being done by the Government.

For the testing of loads under high heat the material to be tested a column of concrete, cement, etc.—is placed on the brick piers, and on top of the material hydraulic jacks of great power are set. These jacks exert both a downward and an upward pressure, the upper pressure being against a heavy steel beam.

The furnace is to be in charge of Mr. Walter A. Hull, expert in testing fire-resisting qualities of building materials. Mr. P. H. Bates is head of the Bureau of Standards branch at Pittsburgh.

H.M. Board of Works are pushing forward the scheme for the pointing and strengthening the ruins of Lindisfarne Priory. The work will extend over five years.

A FRENCH EXPERIMENT FOR PREVENTING FOGS.

The municipality of Lyons has set aside a certain sum to carry on experiments for preventing local fogs, proposed by M. Georges Onofrio, Director of the Fourvière Observatory of that city. In contradistinction to general fogs that often cover plains of the North of France, and the sea fogs that envelop many of the coast towns, the Lyonnaise fogs are altogether local. Frequently in winter the fog rises and filters through the streets, shutting out sunshine and causing discomfort to the inhabitants.

This fog is really an anomaly, because at a comparatively short distance away from the city there may be absolutely no fog. A strong wind will often clear the town of mist and bring a return of clear weather, whereas in cases of a general fog extending over a vast area a wind may be slow in bringing about a return of normal atmospheric conditions. Owing to the heights along the rivers, this fog cannot escape except at one side, towards which a part rolls, thins out, and often disappears. In consequence, much confined, the fog thickens and increases in volume over the rivers, quays, and thoroughfares, and becomes injurious to health and interferes with traffic. Certain measures have already been suggested, such as great blowing-machines from the heights above the city, and also the use of Hertzian waves. The project formulated by M. Onofrio consists in pouring oil on the rivers some distance above the city at a point where the fogs usually collect, so that the surface of the streams will be covered with a thin oil-film for a distance sufficient to prevent the rise of vapours within the fog area.

Various facts have been collected from different points, showing the efficacy of the oil-coats in reducing the roughness of water, escape of unhealthy odours, and the prevention of rapid evaporation. Experiments have been made on a small scale with a long vat, at the end of which very hot water was introduced. At the other end there was an opening, so that there was a rapid and regular current. From the entire surface thick steam constantly rose. At about one-quarter of the distance from the inlet a dividing partition was let down in the form of a double sieve holding tow moistened with a small quantity of oil. Following the current, an oily coating extended over the lower three-quarters of the vat, and immediately vapour ceased to rise. It is estimated that a coating of oil one 1-100000 millimetre (the millimetre equals .029in.) in thickness is sufficient to cause the disappearance of the vapour from the boiling water.

This experiment was carried out with water at the temperature of about 185deg. F., whereas the temperature of the two rivers on which Lyons is situated averages about 59deg. F.; so it is believed that an exceedingly thin sheet of oil will be still more efficacious when spread over a cold surface, even should it attain the thickness of 1-200000 millimetre. The thickness proposed for the rivers is 1-150000 millimetre, which will require about 8 of a gallon for about every 460,000 square metres. The oil best suited to this work has not yet been determined. Trials are being made with as many as fourteen different oils—animal, vegetable, and mineral—to find one that will come nearest to fulfil the required conditions. It should be an oil that will spread rapidly and easily over the surface of the water, and at the same time it must be an oil with the strongest possible power of resistance and tenacity.

An oil-film that will readily break on the water is of little value. These two qualities are more or less opposed, and it will require some study to find the oil that will spread most easily and still not break. It is thought that an animal or vegetable oil will be found preferable to a mineral oil, though the mineral oils would probably be a good deal cheaper. It is not possible to give the probable cost of keeping the entire city free of fog before an effective oil has been determined upon, although a rough estimate for both rivers puts the expenditure within £6 a day for the oil season.

At the last meeting of the Board of Guardians for Bromley, Kent, a letter was received from the Local Government Board with reference to the new workhouse infirmary scheme, recommending, inter alia, that it possible the pavilion should be so designed that a nursing unit of not less than thirty-six beds should be eventually arranged for, and also that accommodation for twenty children should be provided in a separate block on the main corridor of the new infirmary. It was, after some discussion, decided by a majority to ask the board's architect, Mr. Dunby Smith, to prepare new plans in accordance with the Local Government Board's recommendations.

OBITUARY.

We much regret to announce the death of Mr. Edward Ingress Bell, F.R.I.B.A., who passed away at his residence, St. Stephen's, Winchester-road, West Worthing, on Sunday, in his seventy-eighth year. Mr. Ingress Bell was for many years on the architectural staff of the War Office, and in later years, in collaboration with Sir Aston Webb, won several competitions of the first importance. In 1884, in the competition for the new Admiralty Offices, in which 128 architects took part, Messrs. Webb and Bell sent in a design of great merit, one certainly second to none in happy planning, which was awarded the third premium, and appeared to us at the time to be worthy of a still higher position. This design and its plans were illustrated in our issues of August 15 and 22, 1884. Competitions which were gained by Messrs. Webb and Bell include the Victoria Courts at Birmingham (shown in our pages, August 13, 1886, July 24, 1891, January 1, 1892, and January 13, 1893), built at a cost of £113,000, and now about to be enlarged by the city council at an outlay of £30,000; the United Service Institution, Whitehall (June 2, 1893); Christ's Hospital Schools, Horsham (June 22, 1894, and Oct. 22, 1897); and Birmingham University (September 12, 1902). Among the many smaller works carried out by Mr. Bell may be mentioned insurance offices in Moorgate-street, village schools at Windlesham and Bagshot, schools in the Borough, and houses at Sheen, Richmond, and other riverside districts. Mr. Bell, who retired from practice five years ago, joined the Royal Institute of British Architects in 1866, but did not become a Fellow until 1894. The requiem Mass was held at Our Lady of the Angels Roman Catholic Church, Worthing, on Wednesday morning, and the interment took place at Broadwater Cemetery.

The death is announced, in his seventy-ninth year, of Mr. Thomas Frederick Wright, head of the firm of Messrs. T. F. Wright and Son, surveyors, of Bank Plain, Norwich. Mr. Wright was born in North Walsham. On leaving school he entered a civil engineer's and surveyor's office in London, and afterwards became associated with his father, who was in practice as a surveyor at Norwich. For many years the younger man was away from England through commissions which came to him from the Governments of Spain, Portugal, Holland, Russia, etc. Later he was engaged in many important engineering undertakings in this country and Ireland. About eighteen years ago he ceased his more active life and accepted the position of estate agent for the Melton Constable estate, a post from which he retired a few years ago. He leaves two sons and three daughters. The eldest son, Mr. T. H. Gordon Wright, succeeds his father in the business at Bank Plain.

Mr. Alfred Dowson, C.E., late of Westminster, has died at Fleet, Hants, aged 68 years. He was for many years engaged in the design and construction of engineering works on the sea coast, including piers and landing stages at New Brighton, Hunstanton, Redcar, Cleethorpes, Wallasey, and St. Ann's-on-the-Sea. He was also consulted on the improvement of the harbour of St. Heliers, Jersey, and much of the work subsequently carried out followed the lines he had advocated. Mr. Dowson had made a study of coast erosion; he constructed breakwaters and other coast defence works at various parts of our sea shore, eventually bringing out a novel system of open groynes, which he patented, and applied at the mouth of the River Ribbles, and at Brighton. He carried out several tramway schemes in this country and in India. For some years he was manager of the Economic Gas Power Company at their works at Basingstoke. In conjunction with his brother, Mr. J. Emerson Dowson, he published, in 1875, a treatise on "The Construction of Tramways."

A new school costing £1,800, has been opened at Newton Hill, Wakefield.

Engineering Notes.

NEW ROAD THROUGH STAFFORD.—Rapid progress has been made in the construction of the new road from the Lammascotes to the Lichfield-road, Stafford, under the supervision of the borough surveyor (Mr. W. Plant). One of the principal obstacles which had to be faced was the filling-in of the dead river on the site, for which purpose thousands of loads of material have had to be drawn from the Lammascote building estate. The River Sow has also been bridged over. In addition to ferro-concrete culverts for each of the three brooks over which the road passes, there are two other culverts of similar construction for dealing with the volume of water which comes down the river valley in times of flood. The roadway is raised about six feet above the meadows, and the material required for this purpose has been obtained by lowering the level of the field abutting on the Weston-road through which the road passes. For present purposes a carriage-way, 20ft. wide, will be provided, with a 6ft. grass margin and 9ft. footway on either side. Both sides of the road will be fenced with unclimbable iron fencing 5ft high. It is anticipated that the road will materially assist in the development of the large area of building land on the eastern side of the town, which at present is practically isolated from the south end of the town by the low-lying flood land which intervenes. The road will reduce the distance from Messrs. Siemens' works to the Lammascote and Coton Field Estates by more than half a mile. The position of the road was selected with a view to extension, at some future date, across the Green Common to the Styelfields Estate, thus linking up the whole of the eastern side and forming, in conjunction with Corporation-street, a secondary road through the town. The work of metalling and completion of the road, which is 50ft. wide between the fences, will be undertaken by the corporation.

CHIPS.

St. Hugh's College, Oxford, is making good progress from plans by and under the supervision of Messrs. Buckland, Haywood, and Farmer, of Birmingham. The outlay will be about £24,000.

Mr. Harold Cordon, second son of and assistant to Mr. R. C. Cordon, surveyor to the rural district council of Belper, has been appointed surveyor to the Freebridge Rural District Council, Norfolk.

The rural district council of Hemsworth have adopted a housing scheme, part of a still more extensive undertaking under contemplation, which provides for twenty houses in each of the parishes of Great Houghton, Shafton, Hemsworth, South Kirby, South Elmsall, and South Hindley; forty houses in Brierley and Grime-thorpe; and ten in Rylhall.

The pre-Reformation chapel in Langley Castle, Northumberland, the seat of Mr. C. Bates, has been restored at the cost of the owner, and rededicated for Roman Catholic services. Langley Castle was built in 1350 by Sir Thomas de Lucy, Baron of Tynedale, as a defensive fortress in the troublesome days of border warfare. It has been converted from a ruin into a residence since 1882 by the late Mr. Bates and his widow.

The tender of the Central American Construction Company has been accepted at 210,000dol. for the construction of steelwork, concrete walls, and roofs for Dry Docks Nos. 15 and 16 at the Cristobal terminals of the Panama Canal. This was the lowest tender received, others being from Messrs. R. W. Hebard and Co., Messrs. Lombard and Co., and W. E. Weigl Company, for the amounts of 230,000dol., 232,952dol., and 239,800dol. respectively.

The Pugliese Aqueduct, in Lombardy, which delivers water for various purposes, is 152½ miles long, and has just been finished, after fifteen years' work by ten thousand men. Sixty miles of this length are cut through the mountains of the Eastern Apennines at Venosa. The supply is divided into three branches, with an aggregate length of about 1,000 miles, while 500 miles of piping are required. There are 152 reservoirs, each holding more than 5,000,000 cubic feet. The total cost has exceeded £6,000,000.

Currente Calamo.

As will be seen by a letter we publish elsewhere, the R.I.B.A. has decided not to proceed further at present with the application to the Privy Council for the new Charter. That, we think, is a wise step. Possibly the fact was known to the writer of another letter which we also print, in which a suggestion is made for the amalgamation of the R.I.B.A. and the Society of Architects on lines which, while not absolutely novel, have not yet been fully discussed by the general body of architects, attached or unattached. We should be glad to publish any opinions thereon—for or against—that may reach us.

In the House of Commons last Monday night Mr. Lloyd George explained the Government's intentions as to the moratorium. The Government, he said, had come to the conclusion that, considering the whole position, and although the majority of traders were in favour of bringing it to an end, it would be much too risky at present to end it on September 4. They had come to the conclusion that they must extend the moratorium for another month in its present form. There were classes of debts on which the moratorium might have to be prolonged beyond that period, it might be until the end of the war. These included bills of exchange. We have little experience of bills of exchange ourselves. We had hoped the moratorium would not have been extended; for, as far as our observation carries us, its effect has been to stop ordinary credit, while doubtless relieving big speculative financiers. We are all bound to believe the Government is doing its best every way; but past experience of Mr. Lloyd George's finance prompts the hope that, somehow, it is as well advised at the Treasury as it is by Lord Kitchener at the War Office. There is not the same feeling of public confidence in the one case as there is in the other, however.

The Government is still doing its best to help us by speedy payments. It is announced that, as regards interim payments made before the completion of contracts, the War Office, where the contractor so desires, will make these payments at fortnightly instead of monthly intervals; the Admiralty have arranged for weekly payments on their overseers' certificates, and the Office of Works for fortnightly or weekly payments when desired. The War Office have decided to make interim payments on building contracts on a higher scale than heretofore. The Office of Works are prepared to reduce the value of work to be done before advances on account are made, if contractors desire it. The General Post Office and the Office of Works have decided to expedite the payment of all accounts received, and particularly in cases where the payment of an account might ordinarily have been delayed on account of a dispute as to one or more items, to settle at once so much of the account as is not the subject of dispute. It is hoped that local authorities and other public bodies will be able to make similar arrangements, in order to assist contractors in carrying on their business. We have already mentioned some that have done this. We have made inquiries of others, but from some have received no replies, while others have refused information. That is not wise, and we may have to mention the names of such.

We are glad that many of our advertisers are doing their best to educate the public to the use of a British-made article. Our readers will have seen in our columns during the last few weeks that emphasis has been placed by advertisers upon the use of British instead of German-made goods. We notice, too, the restraint with which many advertisers have worded their announcements. They have not referred to the word "German" or "Germany," probably through sensitiveness; but when the fact is considered that every shilling's worth of British-made goods purchased means support for British supremacy, we think there should be no diffidence in withholding the fact. How many readers who have used German iron, German glass, German dies, lamps, asphalt, and cement waterproofing materials and liquids realise that when they buy these there is some profit made on the material, and that profit goes to Germany. A proportion of that profit is then paid in taxes to support the German army and navy, which is now fighting against us. Before the war we did not say one word against the use of German-made goods when they were as good as English and the price was lower, as in the struggle for existence every man must buy in the cheapest market, although to-day, even for the sake of cheapness, we must not buy German-made goods, if we wish to beat the enemy.

We have certainly known thoughtless architects specify German-made goods. They have had no knowledge as to whether they have come from Germany, and they have not known that the goods have been German. It has simply been the persuasion of an English agent appointed by a German firm, or an English traveller appointed by a German firm that the architect has used their product. We know of British materials which are much better, by all practical and chemical tests, than German products, and yet we know of architects who have thoughtlessly specified the German product. In some cases the Germans have formed a branch in this country, and to hide their nationality, or to distinguish it from the German company, they have given it the title "British." No architect should be led astray by the word "British," because it is a well-known fact that when a foreign company establishes a sub-company in this country it is customary to supplement the name of the parent company by the word "British," to form the title of the sub-company. Once again we earnestly urge to all architects the strong advisability of inquiring where the product is made, and to boycott it during the war, and when that is over to satisfy themselves, if they are asked to specify it, that the quality is as good as a British-made article.

The Board of Trade warns all joint stock companies and their officers that: 1. No dividends or interest declared, or becoming due, after the outbreak of war should be paid during the war to, or in accordance with instructions from, any person resident in enemy territory. Such dividends or interest should be paid into a separate account at a bank, to be disposed of after the conclusion of the war. 2. No transfer of any shares or debentures from any person resident in enemy territory should be registered during the war. This is wise, as far as it goes, but is it sufficient? Unless further steps are taken, we doubt whether "should be paid" will stop dividends going to German share-

holders in companies where German holdings are overwhelmingly predominant, as in the case of companies we have already referred to but the names of which we have not yet mentioned.

In connection with the campaign undertaken by the Board of Trade, on the advice of their Advisory Committee on Commercial Intelligence, to assist British manufacturers and merchants to secure trade formerly in the hands of German or Austro-Hungarian firms, the Board have received a very large number of inquiries for names of sellers or buyers of articles of which sources of supply or markets have been interfered with by the war. Special arrangements have been made in the Commercial Intelligence Branch of the Board of Trade for dealing with the inquiries, and lists are being prepared and circulated of articles which inquirers desire (a) to purchase and (b) to sell. The first lists are now ready, and may be obtained on application to the Branch. Firms interested in any of the goods mentioned, either as buyers or sellers, should communicate with the Director. An enlarged sample room will also be established very shortly, for the purpose of exhibiting samples of German and Austrian or Hungarian goods or materials which have competed with British products at home or abroad, especially those which are necessary for the continuance of British manufacture, but which it is now impossible for them to obtain from their previous sources. Firms who may wish to exhibit goods are invited to make application to the Commercial Intelligence Branch. It should be expressly understood, however, that the exhibition is intended exclusively for samples of goods which have formerly been obtained in Germany and Austria-Hungary alone, and which firms may now desire to purchase in the United Kingdom. Notice will be given of the opening of the exhibition. A catalogue library will also be opened, and firms who may not desire to exhibit samples are invited to furnish catalogues of goods formerly received by them from Germany and Austria-Hungary; these catalogues to be classified by trades in order to be readily accessible to inquirers. The address of the Commercial Intelligence Branch is 73, Basinghall-street, London, E.C.

According to the annual report of the paving, sewerage, and highways department of the Manchester Corporation, submitted to the city council on Wednesday, during the past year 36 103 square yards of new granite pavement have been laid on 6in. concrete foundation. This work has been principally on the roads where the increasing traffic, both in regard to speed of vehicles and weight of loads carried, is having such destructive effect on the old pavements that the committee are of opinion there is no alternative to complete reconstruction, early as it will be. Asphalt pavement is being substituted in many cases for the old set pavement. Granited rock asphalt is the noiseless pavement which the committee have decided to lay in front of four schools. The wood pavement in St. Ann-street is to be taken up and granited rock asphalt pavement substituted. On the question of granited rock asphalt the committee have had letters from contractors stating their inability, on account of the war, to obtain the material specified in their contracts, which usually comes from German and French mines, and asking to be allowed to use

similar material obtained from other sources. The committee have acceded to the request on conditions.

In Canada, one effect of the war seems to be a considerable impetus to land buying. The Saskatoon Building Trade Weekly News Letter says: Since the outbreak of hostilities the remarkable number of land inquiries received by local dealers from all over Canada, and from many sections of the United States, would seem to imply that the war has resulted in what is likely to become the first really important back-to-the-land movement. To many whose sources of livelihood have been most seriously affected, if not entirely suspended, there comes the tardy recognition of the fact that it is impossible to starve out the mixed farmer, and that of all men he is most thoroughly independent of every or any crisis or cataclysm. This is because it is his business to raise food. The man who, in the morning, can raise his window-blind and look out upon even a small and humbly-stocked farm of his very own is indeed to be envied. That his position actually is envied, the present marked awakening of interest in our lands would seem to confirm. Further, within the past ten days, several important parties of land buyers have arrived from the States and elsewhere, and business has been encouraging. This more especially as all of such buyers have been mixed farmers and stockmen.

The death is announced of Mr. R. Innes, whose landscapes have been a prominent feature of the exhibitions at the New English Art Club.

The creation of a new permanent appointment of Assistant Superintendent, Archaeological Survey, has been sanctioned by the Government of India.

Tenders are about to be invited for the 100,000-dol. warehouse which is to be erected at Montreal by the Harbour Commissioners. The architect is Mr. F. W. Cowie, Montreal.

The estate and property committee of Newcastle-on-Tyne Corporation decided on Monday to advertise for tenders for the erection of baths at Heaton, Benwell, and Walker, the tenders to be sent in and adjudicated upon by Tuesday in next week.

At Sheffield on Thursday next a Local Government Board inquiry will be held into an application by the corporation for sanction to a loan of £24,214 for the provision of public baths in Langsett-road, Hillsborough, and Merton-lane, Winebank; of public washhouses and conveniences in Daniel-lane, Uppertorpe; and of a central laundry near Penistone-road.

An inquiry was held on Tuesday by Mr. R. H. Bicknell, inspector to the Local Government Board, at Ashington, concerning an application by the urban district council for powers to borrow £5,000 for works of water-supply, principally for increasing the carrying capacity of mains. Mr. C. Alderson, clerk, and Mr. G. Beaty, surveyor, appeared for the council. There was no opposition.

An extension of the *Daily Chronicle* premises, which will bring the floor area to over six acres, is being carried out by Messrs. Vigers, the builders. The editorial main entrance, which at present is in Whitefriars-street, will be through a new office in the widened part of Fleet-street, almost opposite the *Daily Telegraph*. The elevation is being designed by Mr. E. L. Lutyens, F.R.I.B.A., but the general architect for the building being Fleet-street, except the elevation is Mr. T. H. Smith.

Mr. H. S. Stewart, A.R.I.B.A., Local Government Board inspector, held an inquiry at the public hall, Westerham, into an application by the Sevenoaks Rural Council for sanction to borrow £2,000 for the purpose of carrying out a housing scheme. Eight cottages are proposed to be built on an acre of land at the back of the gasworks, in Rysted lane. The estimated cost of the cottages was £1,700, and the price of the land £200. The cottages, let at 5s. 6d. per week each, were estimated to produce £114 8s. per annum, and the expenditure was set down at £113 0s. 6d.

PROFESSIONAL AND TRADE SOCIETIES.

BEAUX ARTS ATELIER.—The Beaux Arts Committee give notice that the work of the Atelier at 16, Wells-mews, Oxford-street, W., is proceeding as usual. The time for executing the June projet has been extended to Sept. 30. The new session commences to-morrow (Saturday) when the esquisse for the first monthly competition will be held. In order to facilitate arrangements it is asked that members who wish to make use of the Atelier during the coming session will notify the secretary at once. The Sous-Patron, M. Chaires, is at present serving with the Army of France. During his absence his duties will be undertaken by a competent deputy.

R.I.B.A. EXAMINATIONS.—The Final Designs Approved.—The Board of Architectural Education announce that the designs submitted by the following students, who are qualifying for the final examination, have been approved:—

SUBJECT XV.

(a) Design for a Museum (detached) in the Park of a Country Town.—P. J. Adams, W. Alison, W. Allison, J. R. Armstrong, W. A. Batty, C. J. Brooks, J. M. Brown, J. Burford, P. Butt, J. Carey, L. E. Carreras, C. C. Cheek, W. L. Ching, A. D. Clare, G. A. Cossar, A. Cullen, J. K. Currie, W. R. Davison, B. Donaldson, T. W. Dowsett, R. A. Duncan, T. C. Evans, S. Fernyhough, A. S. Forbes, L. S. Ford, R. Frater, F. E. Gooder, H. F. Gossling, R. D. Graham, H. V. Hague, A. B. Hamilton, T. Herford, G. H. G. Holt, J. Hossack, G. B. Howeroft, J. H. Jacob, L. F. Jones, W. O. Jones, A. B. B. Jopling, H. Z. Kassem, M. D. N. Koch, C. Lancaster, G. S. Leadam, H. A. Lister, S. H. Loweth, R. H. Maddock, R. S. Moore, W. N. J. Moscrop, D. J. Moss, J. J. Nathanielsz, C. L. Pace, J. Palmer, G. A. K. Robertson, H. A. Ryan, C. D. St. Leger, T. A. Sanders, G. Sheustone, A. T. Spence, K. Takekoshi, J. A. C. Taylor, J. B. M. Welch, P. Whitehead, F. Wilkinson.

(b) Design for an Open-Timber Roof to a School Hall.—W. A. C. Adams, J. R. Armstrong, C. H. Aslin, G. A. Booker, R. Cawkwell, C. W. Craske, J. S. Fyfe, G. H. Gray, C. Grellier, E. C. Lavender, W. V. Lawton, A. L. MacMillan, J. Moore, C. S. Pictou, W. G. Pidsley, M. Robertson, A. Smith, J. C. P. Toothill, G. Vinden, D. H. Walker, H. F. Walker, C. H. Wright.

Designs for other subjects from the following candidates have also been approved:—

J. Burford, D. A. Carmichael, A. B. Hamilton, A. L. Mortimer.

THE SOCIETY OF ARCHITECTS.—The following is the "house list" of nominations for officers and Council of the Society for the ensuing session, 1914-15:—President: E. C. P. Mounson, F.R.I.B.A., F.S.I., London. Vice - Presidents: Edwin J. Sadgrove, F.R.I.B.A., London, and A. Alban H. Scott, M.R.San.Inst., London. Past-Presidents: Albert E. Pridmore, F.S.I., London, and Percy B. Tubbs, F.R.I.B.A., London. Hon. Secretary: George H. Paine, London. Hon. Treasurer: P. M. Beaumont, A.M.Inst.C.E., Maldon. Hon. Librarian: Gilbert A. Harrison, Oxford. Council: Henry Adams, M.Inst.C.E., London; B. D. Cancellor, Winchester; Henry A. Cooper, Kettering; R. Cecil Davies, Chester; George E. Dickens-Lewis, Aberystwyth; Herbert O. Ellis, London; Herbert Freyberg, F.S.I., London; Harry Gill, Nottingham; T. Stewart English, London; R. A. Jack, London; Col. F. S. Leslie, R.E. (retired), Woolwich; Herbert W. Matthews, London; F. C. Moscrop-Young, London; Edward J. Partridge, F.S.I., Richmond; J. Herbert Pearson, London; Charles E. Salmon, Reigate; Noel D. Sheffield, London; Alfred J. Taylor, Bath; B. R. Tucker, M.R.San.Inst., London; and Thomas Wallis, London. Additional nominations for Council and officers may be made by any three members who shall send in their nomination, properly signed, to the Council, before the first day of October, and the names of such nominees shall be incorporated with the list proposed by the Council, which shall be arranged alphabetically. The annual meeting of the Society will be held on Thursday, October 22.

The Scarborough Town Council have decided to apply to the Local Government Board for sanction to borrow £16,070 for the purposes of improving the South Cliff Gardens.

A tower of Portland stone is being added to St. Mary's Roman Catholic Church, Donnybrook, Dublin. Messrs. W. H. Byrne and Son, of Suffolk-street, Dublin, are the architects, and Mr. M. J. Green, of Donnybrook, is the contractor.

COMPETITIONS.

NEW MUNICIPAL OFFICES, GUILDFORD.—The plans of Mr. T. R. Clemence, M.S.A., of Guildford, have been placed first in a limited local competition for the new municipal offices. The assessor, Mr. J. H. Norris, of Godalming, states that the chief merits of the plans were the way in which the architect had adapted them to the gradation of the site. He had provided a lower ground floor, and an upper ground floor, making use of the rise of the land. The lower ground floor would be used as the sanitary inspector's offices, stores, and a strong-room, and the upper ground floor as a town clerk's office and the rate collector's office, and the floor above as the surveyor's department. Another good feature of the plan was the excellent way in which the corridors were lighted, and also the splendid drawing office which had been provided. The front elevation was good and the back elevation also. These were the merits, but there were some drawbacks. He felt it rather inconvenient that the main entrance of the building was to be at the south-east end. Another drawback was that the strong-room occupied a position near an outside wall and close to the heating chamber; but perhaps these details might be rearranged. In other respects the planning was very satisfactory. In addition to the main entrance there was also an entrance at the north end, and probably in practice this would be most largely used by the public. The estimated cost of the building is £4,266.

The council of the Royal Institute of Public Health has placed its laboratories at the disposal of manufacturers and others who wish to avail themselves of the institute's bacteriologists and chemists.

A White Paper issued on Tuesday shows that the total receipts in respect of the land registry for the year ended March 31 last were £56,995 3s. 10d., as against £56,697 16s. 2d. in the previous year, whilst the expenditure amounted to £51,872 10s. 1d., as against £51,558 10s. last year. Of the surplus of receipts (£56,697 16s. 2d.) over expenditure (£51,558 10s.) in the previous year—viz., £5,139 5s. 10d.—£5,130 7s. was transferred to the Land Registry Insurance Fund.

In February the Bradford Corporation's electricity committee accepted a tender of the Adnil Electric Company, Ltd., of London, to supply and erect a turbo generator of 5,000-kilowatt capacity, manufactured by the Bergmann Electrical Works, Berlin, the price agreed upon being £9,370. The generator was nearly completed when war broke out. The committee met on Tuesday, and decided to relet the contract to the British Westinghouse Electrical Manufacturing Company, of Manchester, who stated that they put in a specially low tender in order to find employment for their workmen.

The Under-Secretary for Home Affairs, Mr. Ellis Griffith, presided at the annual meeting of the Welsh Housing Association, held on Friday night at the Westminster Palace Hotel. Lady Boston, the president, said they desired more funds, in order to proceed with the erection of cottages, so as to provide work for the unemployed during the year. Mr. A. T. Davies, of the Board of Education, suggested that as the building trade would be the first to feel the pinch of the war, the work of repairing and re-modelling cottages should be taken in hand at once, and that owners who could not bear the expense should hand them over to the association to undertake the work.

At Friday's meeting of the Foleshill Rural District Council, the housing committee reported further with respect to the proposal to erect thirty houses at Foleshill, and an equal number at Bedworth. They had considered tenders for the work, and recommended the acceptance of the two lowest—that of Mr. John Smith, Bedworth, at £6,000, for the Bedworth scheme, and that of Messrs. William Train, Ltd., Nottingham, at £6,597, for the Foleshill scheme. They further recommended that application be made to the Local Government Board for a loan of £14,250, for carrying out the schemes. The clerk explained that it was proposed to erect houses with three bedrooms, to be let at 7s. weekly, and it was estimated the net yearly income would be £1,064 10s. It was anticipated that at the proposed rental there would be neither a profit nor a loss on the undertaking. The tenders were accepted, and it was decided to proceed forthwith with the work.

Our Illustrations.

A DINING-ROOM IN A COUNTRY HOUSE.

The intention of Mr. H. Davis Richter, R.B.A., in preparing this scheme has been to obtain a bold decoration effect in the manner of the Inigo Jones period. The walls are broadly panelled with wide, carved mouldings, projecting beyond the face of the framework. The plaster ceiling is enriched with a border of ornament, the centre portion being upon a higher plane, in the manner characteristic of the style herein adopted by the artist.

HOUSES IN WIMPOLE STREET, W.

These houses have been erected with Portland stone façade with steel casement windows and leaded glazing. We give the chief plans of Nos. 30 and 31, Wimpole-street. The ground floor is planned to provide as much accommodation as possible, and especially to suit the requirements of a medical practitioner; at the same time an attempt has been made to depart from the stereotyped plan of narrow passage and staircase fronting the entrance, by providing a central hall, top-lighted. The floors of the principal rooms and the staircase and joinery are of oak. The builders were Messrs. D. Prosser and Son, and the architect was Mr. F. M. Elgood, F.R.I.B.A.

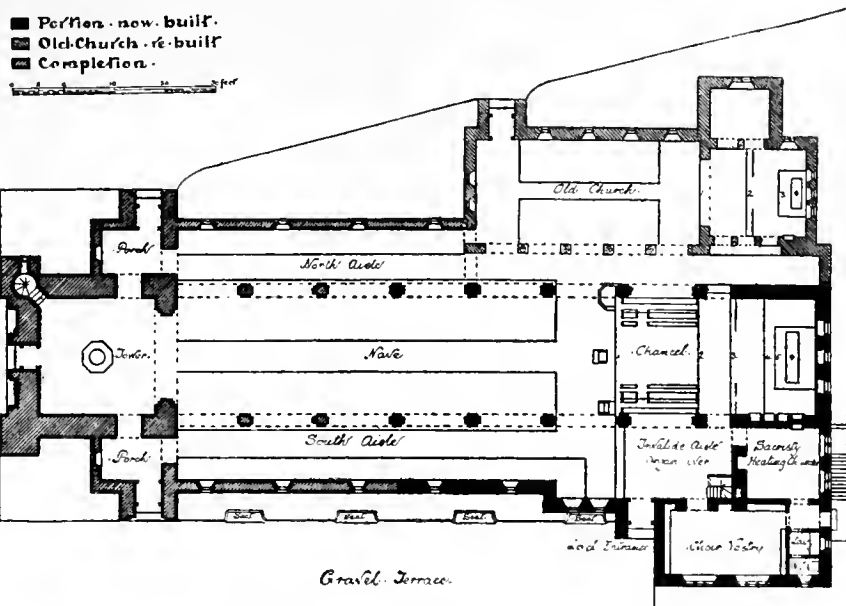

RESTORATION OF THE HALL OF AN OLD MANOR HOUSE.

This drawing, which forms the subject of one of our illustrations, is intended by the artist rather as a suggestion of the resources for interior work latent in the Mediaeval style than as an actual restoration or design. It is an assemblage of characteristic parts, and conserves the picturesque charm, the romantic air, of the 14th century. The stone floor and mullioned screen, the oak-ribbed

Ground Plan.

CHURCH OF ST. THOMAS-ON-THE-BOURNE, SURREY.

Mr. H. S. SIDEBOTHAM, Architect.

ceiling, the carved heraldry of the chimney-piece, with its line of emblazoned shields, indicate the picturesque age of building. Here and there pieces of furniture and small domestic matters affirm the occupation as a living-room. The original was exhibited at this year's Royal Academy by Mr. G. Wortley Chilton, of Watford.

THE CHURCH OF ST. THOMAS ON-THE-BOURNE, SURREY.

This work was begun in 1910, and the chancel, with the vestries, are structurally complete. Three bays of the nave were also built; but these have not yet their

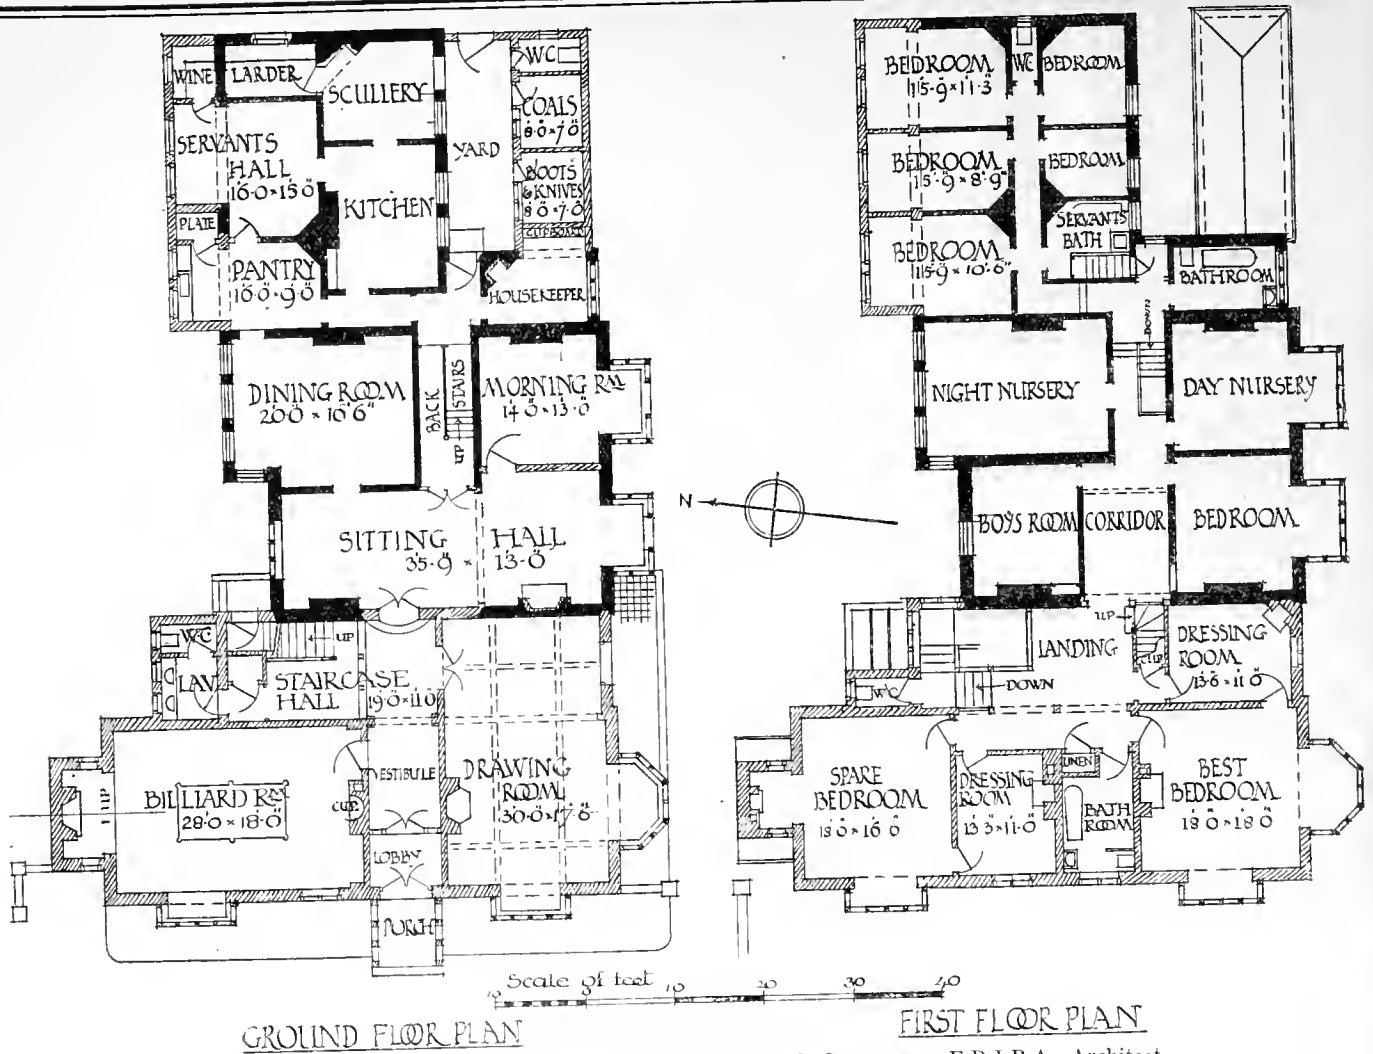

clerestory windows, and a temporary iron roof covers both nave and aisles. A feature of the plan is the invalids' aisle, into which they can be wheeled in their chairs by the level entrance, and they are also level with the altar-rails' step. This aisle is beneath the organ-loft, which has a soundproof floor. The church is built of Bargate stone, with Douling stone dressings, the interior of the walls being of brick, plastered and whitewashed, and prepared for mural subject paintings. When complete, the church will have a very massive western tower. The materials of the old church, when pulled down, will be utilised on the new site, as a Lady-chapel. The church stands on a commanding site of two acres, on the top of one of the Surrey hills. The builders were Messrs. Mardon and Mills, of Farnham, and the architect is Mr. Henry S. Sidebotham, of Guildford.

"DENE LODGE," ASH, NEAR ALDERSHOT.

First Floor Plan.

The illustration shows the additions and alterations which have recently been carried out to this house for Mr. R. E. Bellios. The original house was a small, plain, box-like structure, covering, roughly, the position now occupied by the dining-room, sitting-hall, and morning-room. Some few years ago a servants' wing was added on the east side, and again at a later date the bays towards the garden on the south. The original structure was of red brick, with slate roof, the slates on the roof of the servants' wing being of a particularly aggressive and ugly colour. The problem was to provide the additional accommodation required, and at the same time to cover up, as far as possible, the exceedingly ugly features of the old house. The means adopted were to add a new wing on the west side of the house, projecting it sufficiently far to the north to hide the unsightly servants' wing behind it, as shown on the plan, and to mask the ugliness of the old north front (which was the side by which the house was originally approached), the old servants' wing was brought forward and an overhanging upper story in half-timber work was added, which served to hide in great measure the dullness of the old slate roof, while providing for much-needed accommodation to the servants' quarters. The walls of the new portion of the house were executed in local red brick, with dark headers to match old, and the roofs covered with grey-green Delabole slates of varying colour and size. The half-timber work was executed in English oak, slightly darkened and oiled, and the spaces filled in with cream-coloured plaster, left with a rough face. Internally the walls

"DENE LODGE." ASH, NEAR ALDERSHOT.—Mr. H. O. CRESSWELL, F.R.I.B.A., Architect.

of the sitting hall, staircase hall, and vestibule up to the new front door were panelled in oak for a height of 7ft., and the floors of the new rooms were laid with oak boards in narrow widths. During the time that the works were in progress an opportunity occurred to purchase additional land on the west side of the property, and by this means a new approach was formed from the main road on the west side, instead of the old one from the north, and the square forecourt shown in the sketch was added to give more dignity and importance to the entrance. The architect was Mr. H. O. Cresswell, F.R.I.B.A., of 17, Buckingham street, Adelphi, W.C.

OLD BEAUPRE, COWBRIDGE, GLAMORGANSHIRE.

(These sketches and details, with which we have been favoured by Mr. W. Eaton, A.R.I.B.A., will be found described on p. 300.)

The Long Eaton Urban District Council have decided to commence the erection of a new filter-bed at the sewage farm at a cost of £500 and the improvement of the main sewer in the Sawley-road district at a cost of £200.

The rural district council of Pennington have received the sanction of the Local Government Board to loans of £11,575 for work of covering at Milford, and of £5,345 for similar work at Pennington.

At the annual meeting of the South Carolina Chapter of the American Institute of Architects recently held at Charleston the following were elected officers for the ensuing year: President, Mr. Charles C. Wilson, of Columbia; vice-president, Mr. E. V. Richards, of Bennettsville; secretary and treasurer, Mr. James D. Benson of Charleston. On the same day, the South Carolina Association of Architects met and elected new officials as follows: Mr. A. W. Fohl of Charleston, president; Mr. J. B. Crumhart of Columbia, vice-president; Mr. J. H. Sam-

Building Intelligence.

EDINBURGH.—The schools under the control of the Edinburgh School Board reopened on Tuesday. As is the custom, a number of the schools have been overhauled during the summer vacation. The work is done by rotation, and five schools—Gilmor-place, Torphichen-street, Bristo, Davie-street, and the old section of the Royal High School—have been dealt with. Four schools have also been redesked. Internal structural alterations were carried through at Dalry and St. Bernards. In consequence of the conversion of the Canonball House into classrooms, it was necessary to make some alterations on Castle-hill School. The only new school in course of erection is King's Park, which is expected to be ready within a few months.

SIDMOUTH.—The tower of Sidmouth Parish Church, Devon, is undergoing a process of overhauling; the belfry windows are being renewed, and the stonework of the large west window, which contains some rather good modern glass, is being repaired. Mr. R. W. Sampson, M.S.A., is the architect supervising the restoration. It is proposed to enlarge the vestries at the east end of the building, we understand, but for this there does not appear to be a site without diverting the public paths and interfering with the graves of the old burial-ground. The old tower has not suffered so much from incursions work as the rest of the church, which has long been much denuded of its historic character. The blue-centre panel of the pinnacles quarrels badly with the vicious blue of the east window coloured glass erected some years ago.

STAFFORD. Extensive alterations have just been completed at Messrs. Riley's large boot factory from plans by Mr. C. W.

Millen, architect, of Stafford. The principal feature of the alterations is the conversion and extension of the ground floor into one large room, so as to bring the whole of the bottoming department into one. The floor space is 124ft. by 108ft., the roof is in one span, 22ft. high. The whole of the five departments can be supervised from any position in the room. On the first floor a number of small rooms have been gutted and the space utilised for offices. On the same floor there is a stockroom, arranged with compartments and tiers of shelves for boots, and facilities have been provided for the despatching and packing of goods from the same floor. The clicking and machine rooms are located on the top floor, divisional walls having been removed and the chimney stack, which formerly ran through the centre of the building, built outside, so as to throw this into one room. The machine room, which accommodates over 100 females, is lighted both from the sides and the top. The ventilation is by electric fans, and a new electric hoist is being installed. Two unoccupied cottages adjoining the factory are shortly to be demolished, and a leather storeroom will be erected. The building work has been carried out by Messrs. J. Jervis and Sons, of Stafford.

The new office building of the Quebec Harbour Commissioners, which was opened three weeks since, is Classic Renaissance in style; it is built of Desechambant limestone, while the roof and clock-tower are covered in copper. The building was erected from plans prepared under the supervision of Mr. Thos. Reid Peacock.

Excavating is in progress for the new police-station which is to be erected at Regina, Alberta, at a cost of nearly 150,000dol. The building is to be four stories high, of stone, brick, and reinforced-concrete construction. Messrs. Clomesh and Portnal are the architects, and Messrs. Frid Lewis, and Co. the general contractors—both Regina firms.

Correspondence.

THE R.I.B.A. PROPOSED NEW CHARTER.

To the Editor of the BUILDING NEWS.

SIR,—The Licentiates' Provisional Committee (London) having been formed, with a view to safeguarding the interests of Licentiates and others, and also with a view to co-operating with other like-minded committees already in operation elsewhere, has been concerned as to the present position of this matter, as affected by the war. I have, therefore, approached the President, and I append his reply.—I am, etc.,

J. EDWARD STILL (Chairman).

[Copy.]

Royal Institute of British Architects,
August 10, 1914.

Dear Sir,—In reply to your letter of the 6th inst., you may take it for granted that the Council of the Institute will not be occupied with the consideration of the New Charter, or take any steps in connection with it at the present time.—Yours faithfully,

ERNEST NEWTON, President.

IF NOT NOW, BY-AND-BY?

SIR,—I was pleased to see in your last issue that the Society of Architects is loyally facilitating the efforts of the R.I.B.A. War Committee by all means in its power. The main purpose, of course, is the chief thing to think about and work for at present; but I am glad to think that, working together, the members of both bodies will probably get to know and appreciate each other more than they have done in the past.

Hoping this, and remembering how this war has effaced all other feuds and rivalries, might not all concerned ask themselves and each other whether the proposal for amalgamation might not be revived, instead of, or previous to, application by the R.I.B.A. for the new Charter?

If an "Amending Bill," as in the case of Ireland, is necessary, I respectfully suggest that the union of hearts and forces might be on some such basis as this: All members of the Society to retain their present titles and to pay their present subscriptions to the R.I.B.A. and to be entitled to all the privileges of corresponding members of the R.I.B.A., but no more M.S.A.'s to be made. Premises and assets and officers of the Society to be taken over by the R.I.B.A. and the whole administration of the Society.

I am sure details on these lines could be easily arranged, and then, in a very few years, the amalgamated societies, *one de facto*, would become *so de jure*, and the one really strong and representative organisation of the profession might ask, without fear of refusal, for the regulation of its interests and the guardianship of entrance to its ranks.—I am, etc.,

ALTER IPSE AMICUS.

RE ENLISTING.

SIR,—For the convenience of all members of the architectural and kindred professions who wish to respond at once to Lord Kitchener's appeal, it has been arranged that all men enlisting at Whitehall, in the various branches of his Majesty's forces, through the Architectural Association, will be kept together and sent to whichever regiment they may choose, provided that such regiment is not recruited to its full strength.

Two batches of our members have already been accepted for the Royal Engineers, where their technical training should stand them in good stead; but those who prefer to join the cavalry, artillery, or infantry can do so, and it remains for the men to say to which branch of the Service they will go.

As I am arranging to send up batches from time to time, will those wishing to enlist communicate with me as soon as possible?

Mr. Maurice E. Webb, President of the Architectural Association, has enlisted as a private in the Royal Engineers.—I am, etc.,

ALAN POTTER.

Hon. Sec. Architectural Association
War Service Bureau.

18, Tufton-street, S.W.

ASSISTANCE TO THE ENEMY.

SIR,—I have read with much interest the letter of "Fair Play" in your last week's issue, and I think wherever architects can, they should exclude all building materials, fittings, and decorations which emanate from German firms.

In a small way, in consequence of the war, I have just had the opportunity of using glass electric-light shades of English make, instead of German. I find, on comparing the two specimens, that the English is far superior, and my clients are quite willing to incur the extra expenditure, which, by the way, is very small.

I may add that before the war I should have passed the German glass without any comment, simply because the contractor included for such in his estimate.—I am, etc.,

WM. WOODWARD, F.R.I.B.A.

13, Southampton-street, Strand, W.C.,
Sept. 1, 1914.

THE WAR AND RELIEF WORK: THE USE OF WASTE SPACES.

SIR,—It is strange that, among the innumerable suggestions that have recently been made for alleviating the terrible distress which would appear to be inevitable, one of the most obvious has never even been mentioned. I refer to the laying out of public parks and gardens in and around those large centres of population where it is certain to be most acute. Twenty years ago, during the distress which then prevailed, owing to the slackness of trade, a great deal of this sort of work was done, with the most beneficial results, for not only does it provide for the employment of a very large proportion of unskilled labour, but it also produces results of the highest permanent value, an advantage which most relief works lack.

During the time to which I refer parks were laid out at Sheffield, Hanley, and Burslem in the Potteries, Newport in Monmouthshire, Rawtenstall in Lancashire, and many other places too numerous to mention, partly by municipal effort and partly by philanthropy, and if there is any regret in the minds of the promoters, it is that these works were not undertaken more generally and on a larger scale while the opportunity existed to do so with such beneficial results. It is interesting to realise that of the parks laid out during the last sixty years more owe their existence to adversity than to prosperity.

What I would propose would be a similar combination of public and private effort at the present time. In various parts of the country, and especially in rapidly growing districts, there must be domains covering several acres, which, charming at one time, are now so surrounded by factories or mean suburbs as to be no longer even commercially valuable for their original purpose, and the owners would be doing an inestimable service in either giving them or offering them at a specially reasonable purchase price to the municipalities, on the understanding that they were to be maintained as an open space for ever. The work thus automatically created would go far to relieve distress without pauperisation, for the average unskilled labourer by which I mean practically all those unable to find employment in their own craft after a week or so of careful supervision, can use a spade and enjoy his work thoroughly. There are men in the districts to which I have referred who to-day bless the misfortune which compelled them to turn from an indoor occupation to wield a spade in the open air for weeks, and who, in consequence, not only obtained a love for open air exercise which has never left them, but an increased physical stamina which has altered the whole tenor of their lives.

There is one great difference, however, between the conditions twenty years ago and those which prevail to-day. In those days the park was considered solely as a unit in itself, whereas to-day we realise that it is only one aspect of the greater problem of city planning and that not only in it but around it many works will be necessary to

form out of the heterogeneous elements at present existing a unified composition. What I would therefore suggest is that every town which has in hand at present a town-planning scheme—and there are many of these—should hurry the work forward so far as to make sure that when relief works are required they will be prepared with the necessary data to allow of road making, levelling, and such work as the planting of waste spaces and spoil heaps, so that they may have the assurance that nothing will have to be redone through lack of foresight and haste in putting the work in hand. The more expensive work, such as the provision of fencing and architectural details, might be left until later.—I am, etc.,

THOMAS H. MAWSON.

High-street House, Lancaster, Aug. 25.

[We heartily agree. Our own illustrations of Mr. Mawson's work at the time he mentions are well remembered by all interested, and his good counsel, coming as it does from the most prescient pioneer in the movement for parks and open spaces, and still without doubt the leading authority thereon, is most valuable.—Ed. "B.N.]

THE ROLL-CALL: VETERAN MEMBERS R.I.B.A.

SIR.—This abstract of the serial numbers of the Fellows anterior to the figures of 400, as recorded in the present "Kalendar," in this day of reckonings, may be of interest. Messrs. Edward R. Robson, F.S.A., 74; John MacVicar Anderson, 97; W. B. Dawson, 99; Rowland Plumbé, 105; Fred Chancellor, 115; F. R. Kempson, 118; Edward Drury, 137; R. P. Notley, 139; Sir Wm. Emerson, 140; W. Parslow (Liverpool), 161; J. Donglass Mathews, 166; R. E. Edwards (Strand), 174; Sir Alexander Stenning, 190; G. T. Hine, 192; Charles Clegg (Manchester), 195; R. Phene Spiers, F.S.A., 196; H. Heathcote Statham, 213; John Wynne (Manchester), 218; H. L. Florence, 220; T. E. Collett, 223; W. Lister Newcombe (Newcastle-on-Tyne), 244; Sir Ernest George, A.R.A., 263; S. E. Smith (Leeds), 265; J. W. Common (Leeds), 269; F. W. Waller (Gloster), 276; John Slater, 281; W. Harvey, 285; H. T. Gordon (Finsbury), 284; B. Ingelaw, 295; J. Clarke (Liverpool), 302; J. Hall Morton, 306; Charles Lynam (Stoke-on-Trent), 307; Swinfen Harris, 315; Alexander Payne, 316; Sir Aston Webb, R.A., 321; J. Dunn (St. James's), 336; F. Wheeler, 343; J. Conder, 344; E. T. Hall (Bloomsbury), 347; George Weymouth, 351; Horace Cheston, 355; Keith D. Young, 356; George Edwards, 359; G. C. Inskip (N.S.W.), 362; Hubert Bensted (Maidstone), 363; H. D. Searles-Wood, 364; Fredk. Clere, 365; F. E. Jones, 367; W. Samuel Weatherley, 368; J. Crocker (Exeter), 369; W. L. Vernon (N.S.W.), 372; Arthur Ashbridge (Marylebone), 374; E. H. Harbottle (Exeter), 377; A. Conder, 378; A. N. Bromley (Nottingham), 379; Maurice B. Adams, 381; J. Alfred Gotch, F.S.A., 382; J. S. E. Ellis, 389; Charles H. Samson (Rugby), 391; Fredk. Bath (Salisbury), 397. The Fellows thus elected were added to the R.I.B.A. membership during the twenty-one years from 1860 to 1881. Mr. Alfred Goodridge, an Associate, elected in 1852, seems to be "the Father of the House," as his serial is No. 5, and Mr. F. Holyoak Moore, of Warwick, another Associate, is No. 43. I am, etc.,

ONE IN THE RANKS.

The baths committee of the Manchester City Council recommend the expenditure of £17,530 for the provision of further public wash-houses. The scheme provides for forty washing-stalls at Moss Side, twenty-six washing-stalls at Gorton, thirty washing-stalls at Newton Heath, and forty-six washing-stalls at Osborn-street.

Mr. James Williams Hobbs, of Norbury Hall, Norbury, builder, who was responsible for the erection of the Hotel Cecil, the Hotel Victoria, the Hyde Park Hotel, and Whitehall-court, was twice Mayor of Croydon, and in 1893 was sentenced to penal servitude for his connection with the Laborator failure, died on June 22 last, aged seventy-one, leaving estate valued for probate at £3,757 16s. 2d. gross, and net personalty £2,683 5s. 10d. He left all his property to his children.

Intercommunication.

GUINEAS FOR BEST REPLIES.

We offer a prize of one guinea every week for what we deem the best reply to any query appearing in this column, which we deem worth insertion.

Replies must be sent in over real name and address. No others can receive a prize. The Editor's judgment is final.

This competition is restricted to buyers of the paper, and with each reply a coupon cut from our front page must be enclosed.

Any number of replies can be sent, but a coupon of this date must accompany each.

All else being equal, brief replies will stand the best chance. We emphasise this, as some correspondents ignore the fact that queries want terse facts, not long essays. Any necessary illustrations must be in line only—no tints or washes—and about twice the size they are meant to be reproduced. We are unable to avail ourselves of replies that contain illustrations unless we receive them by first post on Tuesdays.

The right to withhold the prize in the event of no reply being received worthy of it is reserved by the Editor, who also claims the right to publish any other replies he may deem useful.

QUESTIONS.

[12148.]—WEIGHT ON BEAMS.—Three pitch-pine beams, 7in. by 7in., are placed 1ft. apart, and carried by two strong R.S.J.'s, 13ft. 4in., centre and centre. It is proposed to place a crane on the beams to lift heavy stones. Required, to find out what weight the beams will safely carry.—Simple Method.

Plans submitted by Messrs. Worsfold and Hayward, of Dover, for building a new wing to the Royal Victoria Hospital, Dover, have been passed by the Dover Town Council.

The death occurred at Broadway, Peterborough, on Sunday, of Mr. James Hicks, builder and contractor. The deceased, who was forty-seven years of age, had been ill for some months.

To-morrow (Saturday) the Canadian Northern Railway will run the first through train over the link between Sudbury and Port Arthur, which is now ready for traffic. This gives the company a complete system from Quebec to Edmonton.

Tenders are invited by the Whitby Urban District Council for the provision and scheme of a cliff tramway, or a lift from the beach to the top of the cliff. The undercliff measures, at probable position of tramway or lift, about 250ft. horizontal, and 130ft. vertical.

At Ledbury an open-air swimming-bath, near the Hereford-road, has been formally opened. It measures 75ft. by 21ft., and has twelve dressing-boxes. The bed and walls are of reinforced concrete. The works have been carried out from plans by Mr. R. G. Gurney, surveyor to the urban district council. The contractors were Messrs. David Smith and Sons, of Ledbury.

A Local Government Board inquiry is to be held at Belfast by Mr. P. C. Cowan on Tuesday, the 15th inst., into application by the corporation for sanction to loans for the purposes of (£6,000) extending the Purdysburn Fever Hospital, (£36,117) erecting working-class lodging houses under the Housing of the Working Classes Acts, and (£10,600) extending Purdysburn Lunatic Asylum.

At a meeting of the Gwyrfa Rural District Council (Garnarvonshire), on Saturday, six tenders were opened for the erection of thirty-six workmen's dwellings in the quarry villages of Elenzer and Clwythont, where there is considerable overcrowding as the result of the scarcity of houses. The tender of Messrs. Williams Bros., of Brynithir and Llanberis, amounting to £6,977, was accepted.

Lord Egerton of Tatton has decided to give up thirteen acres of land at Knutsford, for a great road scheme, which is to cost more than £100,000 and employ nearly 3,000 people. The road will open up new districts near Cheadle and Gatley, and join the Wilmslow-Crewe main road, one of the most important in Cheshire. The Road Board has announced its intention of giving £60,000 towards the scheme, and the work is to be pushed on at once.

By direction of the Local Government Board, Mr. W. H. Collin, one of their inspectors, has held an inquiry in the Council Chamber of the Municipal Offices, Southampton, relative to the application of the corporation to borrow £11,923 for the purchase of land at Hollybrook Farm, Harrison-road, and Broadlands-road, as sites for the erection of working-class dwellings under Part III of the Housing of the Working Classes Act, 1890, and also for consent to their appropriation of lands at Bitterne Park, vested in the council for the purposes of the same Act

LEGAL INTELLIGENCE.

BUILDING DISPUTE ARBITRATION.—The award has been given by Mr. W. H. Daw (surveyor and valuer, of 98, Cheapside, E.C.) as sole arbitrator in the matter of "Datchet Copartnership Housing and Allotment Society v. Lane," which he heard in London on July 7 and 15. The reference arose out of a contract entered into by Messrs. T. B. Lane and Son, builders and contractors, of Colnbrook and Brands Hill, near Slough, Bucks, with the society to build twenty-eight cottages at Datchet Common, and the arbitrator was asked to determine the amount to be paid to the respondents in respect of work not completed by them under the contract, which had been, in fact, executed by another contractor, Mr. Bowyer, at a cost of £359 14s. 3d., and whether the society had power, in the circumstances, to enforce a penalty clause in the contract. Messrs. Lane and Son counterclaimed for commodities changed by the society and for extra work done. In his award the arbitrator decided that the society should be allowed to deduct from money in their hands (being part of the moneys under the contract) certain sums for change in commodities, and £40 as a penalty for not completing the contract within the specified time. The society did right in calling in another contractor to complete the work, and he allowed certain items in Mr. Bowyer's account. The respondents were entitled to payment for certain works claimed as extras, but not for carting sand, increased cost of drainage, or increased labour in consequence of the premises being set back. The parties were ordered to pay costs in equal moieties.

AN ARCHITECT'S THREEFOLD POSITION.—**HOTEL COMPANY'S ACTION IN THE HIGH COURTS.**—Sitting in the Vacation Court of the High Courts of Justice on Wednesday, August 26, Mr. Justice Shearman resumed the hearing of the case of the Piccadilly Hotel, Ltd., v. Waring and Gillow, Ltd., and Lockwood. It was a motion to restrain Waring and Gillow, as contractors, from going to arbitration under a contract, and also to restrain Mr. William Lockwood, the architect, from acting as arbitrator. Mr. Terrell, K.C., appeared for the plaintiffs; Mr. Green was counsel for Waring and Gillow, and counsel also represented Mr. Lockwood.—Mr. Justice Shearman remarked at the outset that the architect occupied a much-discussed and anomalous position. He was practically employed and paid by the building-owners, and was, in a certain sense, their servant. In a certain sense he owed duties to the contractors as well, and in another way he was a species of arbitrator. The fact of his being an arbitrator was subject to discussion and decision; but it was quite clear that he owed duties to both parties. It was his duty to protect an employer in these matters. His Lordship did not understand in what way the bill for the work had been swollen so enormously, unless it was due to alterations which had got to be justified.—Mr. Green: There is no question about that. The alterations were very large indeed. That appears from Mr. Lockwood's letter, and was perfectly well known to the plaintiffs at the time. It is not in evidence, but it will not be disputed, I think, that this was a contract for the construction of a hall-room of two stories below the ground—below the Piccadilly Hotel grill—and the alterations were due to the fact that water was encountered, which almost involved two entire architectural works.—Mr. Terrell: I don't agree with that at all.—Mr. Green said he would read Mr. Lockwood's explanatory letter of January 23 last. What plaintiffs had been asking for was some general explanation of a £4,000 certificate which, according to their story, had come to them as a surprise. What they said was, "We don't want details. Give us some general idea of how this large sum has been incurred." Counsel read the letter of Mr. Lockwood to plaintiffs in which he stated that after their conversation he failed to see the matter from their side, and he had already explained the position to Messrs. Waring and Gillow's representative. Plaintiffs (Mr. Lockwood continued) did not realise the extent of the original work. As a matter of fact, the contract sums had not been exceeded to any appreciable amount. The troubles encountered, necessitating what was practically a new building, in his (Mr. Lockwood's) experience were unprecedented, and could not be foreseen, and he thought everyone concerned was fully cognisant of them. Learned counsel, proceeding, said that after the letter plaintiffs made demands for more detailed particulars—accounts and that kind of thing—and Mr. Lockwood's answer was, "I am getting the accounts ready; they will be ready in a short time." On February 5 plaintiffs' solicitors wrote suggesting that he declined to give them information.—Mr. Justice Shearman: There is another letter

of January 20 in which plaintiffs complain. It reads: "I see expenses, and think it very extraordinary that a certificate was issued before you had brought the matter to my notice in any way whatever, particularly as these certificates represent a large amount, and particularly as the greater part are for additional work, authorisation for which has not been proved."—Mr. Green: It was not his business before certifying to say, "This is the amount I am going to certify for." He was put in a position of trust towards each. If they did that, building contracts would be much more onerous than they are. Proceeding, counsel said it was not till February 6 that any demand was made for specific particulars, and then plaintiffs' solicitors asked for a list of all additional works to be delivered by the first post on the Tuesday following. That letter, presumably, was received by Mr. Lockwood on the Saturday morning. The particulars asked for were of a voluminous and complicated character, and Mr. Lockwood replied that it was impossible to give them the information asked for in the time. Upon that plaintiffs served him with a writ. Counsel contended that plaintiffs had endeavoured to build up a case of suspicion against their own architect, and his Lordship was invited to say that he had been acting in a kind of underhand manner, keeping things up his sleeve, and refusing to perform his duties to his employers, and upon that his Lordship was asked to inflict a very serious hardship on his (counsel's) clients.—Mr. Justice Shearman: I observe that on the 23rd Mr. Lockwood sent a summary of the additional works executed to the secretary of the Piccadilly Hotel.—Counsel for Mr. Lockwood said he would like to put a few facts before his Lordship in regard to the conduct of the architect. In July a notice was delivered by Messrs. Waring and Gillow upon the architect with respect to the arbitration. On July 21 Mr. Lockwood had a letter from the solicitors of the plaintiffs in which they said they had received a letter from Waring and Gillow's solicitors advising that they had delivered notice about calling an arbitration in accordance with the terms of the contract. The letter went on to say that plaintiffs saw no reason for the arbitration, hearing in mind the action brought by Waring and Gillow. Mr. Lockwood answered that letter on July 23, pointing out that notice had been delivered to him, and adding: "I feel it my duty to take up the reference and proceed with the arbitration. I shall wait upon my clients and contractors and inform them of my intention in due course."—Mr. Justice Shearman: It is unusual to me that Mr. Lockwood should be made a party to this application. It is possible he can try this claim. That he should take a line claiming to try it makes one regard him with some suspicion.—Counsel: He doesn't desire me to say a single word that would cause your lordship to come to one conclusion or another. He does not want one single argument raised as to whether he should enter upon this arbitration or not. I ask that Mr. Lockwood be released from the action at the earliest possible stage.—Mr. Terrell: I don't propose to trouble your Lordship with any remarks.—Mr. Justice Shearman said he felt that, whatever happened, it was extremely difficult not to do some injustice to somebody. The order he made might very well result in doing persons entitled to a sum of money out of it. On the other hand, if he were to allow the arbitration to proceed, he did not think the building-owners likely to get an unbiased trial, in all the circumstances of the case. However unfortunate it was that people should have to stand out of their money, the ultimate thing in those matters was to see that people got complete justice. He could not help bearing in mind that Messrs. Waring and Gillow had brought an action on the certificate, being well aware that there were disputes between Mr. Lockwood and the building-owners. They proceeded on that, he thought, without sufficient material, and they could not go on with that litigation by getting summary judgment. It was quite clear to his mind that if they had proceeded with that action they could have incorporated any other claims, and in the course of the case it was stated that some months ago an offer was made to remit the dispute to some gentleman who had had experience of building contracts. That offer, if he recollected rightly, was repeated in court. At any rate, the action was subsequently dropped, and at that time the building-owners were bringing an action alleging negligence against Mr. Lockwood, but not alleging fraud. Some very large items—extras of thousands of pounds—seemed to have been ordered by Mr. Lockwood on his own initiative, without the consent of his clients, and it seemed to his Lordship that, by his unwillingness to give information when demanded, Mr. Lockwood had disqualified

himself in bringing a fair and impartial mind to bear upon this dispute. His Lordship intimated that he should make an order restraining the arbitration, and proceeded to remark that Mr. Lockwood was one of the most important witnesses to be dealt with, and his evidence must be taken by the tribunal that took the case. It would be difficult, his Lordship thought, to decide this dispute without Mr. Lockwood being cross-examined as to the part he had taken in the matter.—Mr. Green: Will my friend agree to the dispute being submitted to an independent architect?—Mr. Justice Shearman: It appears to me you want somebody with some legal knowledge.—Counsel for Mr. Lockwood asked that this gentleman should be dismissed from the action.—Mr. Justice Shearman: I have no power to dismiss you. You will have to proceed by summons, I think.—Counsel: There may be an appeal, and in that event my client would have to go to the higher Court. I therefore suggest that the costs against Mr. Lockwood should be reserved.—Mr. Justice Shearman agreed to that.

PARLIAMENTARY NOTES.

RISE IN BUILDING MATERIALS.—Mr. Runciman, in answer to Mr. Tyson, in a Parliamentary reply, said that attention was being given to the complaints of increase of the price of building material. Owing to interruption of trade with the Baltic, it was not possible to avoid an increase in the prices of most descriptions of timber.

HOUSING BILL, No. 2, EXTENSION TO IRELAND.—In the House of Lords on Thursday this measure, brought up from the Commons as an unopposed Bill, passed through all stages. On Friday it received the Royal Assent.

ALIEN ENEMY SHAREHOLDERS.—Mr. Hunt (U. Ludlow) asked the Prime Minister on Monday last whether, in view of the fact that the subjects of countries now at war with the British Empire were shareholders in companies registered in the United Kingdom, or in our Oversea Empire, he could take steps which would prevent these alien enemies from receiving dividends from these companies, either directly or through agents within the British Empire, during the period of the war?—Mr. Runciman (President of the Board of Trade), who replied, said: I am issuing to the Press a notice from the Board of Trade, directing joint stock companies that dividends or interest becoming due after the outbreak of war should not be paid to persons resident in enemy territories, or in accordance with their instructions.

The Warwickshire Education Committee have recommended the county council to erect a secondary school for girls at Sutton Coldfield at an estimated cost of £10,000.

At the meeting on Friday of the Wrexham Town Council, it was decided to apply to the Local Government Board for sanction to borrow £1,000 for the purchase of a motor fire-engine. A further resolution was adopted in favour of applying for leave to borrow £1,660 for the acquisition of land in Holt-road for the erection thereon of houses for the working classes. The borough surveyor submitted plans and estimates for the building of forty-four houses on the land in question, but consideration of these was deferred.

The palace of the Bishop of Llandaff, at Llandath, about two miles from Cardiff, was totally destroyed by fire at midnight on Monday. The damage exceeds £6,000. Llandaff Court was built about 1750, by Admiral Thomas Mathews, to replace the old family mansion, which he ordered to be demolished while he was with the Fleet in the Mediterranean. He died in 1751. Llandaff Court was acquired by the diocese of Llandaff during Bishop Ollivant's tenure of the See (1840-1882). Previous to that the Bishops of Llandaff had not had an episcopal residence since some time about 1630, when the palace at Mathera, near Chepstow, fell into decay.

Mr. W. M. Cross, M. Inst. C. E., Local Government Board inspector, conducted an inquiry at the Institute, Hammerwich, Staffs, on Thursday in last week, with respect to the Lichfield Rural District Council's application for sanction to a loan of £1,930, for the purpose of sewerage and sewage-disposal works for the contributory place of Hammerwich. The Brownhills Urban District Council also applied for sanction to the communication of the proposed sewers to their portion of the district, which had been agreed upon by the Lichfield Rural Council. The scheme had been prepared and was described by Mr. C. O. Rawstrom, engineer to the Lichfield Rural Council.

Our Office Table.

Mr. Percy W. Lovell, the secretary of the London Survey Committee (27, Abingdon-street, S.W.), is seeking for information as to the whereabouts of the rate-books kept by the overseers of the poor for (a) the parish of Hammersmith (originally a chapel-of-ease of Fulham) and (b) the parish of St. Pancras. The books that are in the possession of the borough councils do not, in the former case, go back earlier than 1795, and in the latter are certainly not earlier than 1800.

The Engineering Standards Committee has issued Report No. 66, British Standard Specification for Copper-Alloy Three-Piece Unions for Low- and Medium-Pressure British Standard Screwed Copper Tubes (primarily for domestic and similar work). The unions dealt with are intended for use with Tables I, and H, of the British Standard Specification for Copper Tubes (primarily for domestic and similar work), Report No. 61, which was issued in 1913. The price of the Report is 5s. 2d., post free, and it may be obtained from any bookseller, or direct from the offices of the Committee, 28, Victoria-street, Westminster. It is published for the Committee by Messrs. Crosby Lockwood and Son, 7, Stationers' Hall-court, E.C., and 5, Broadway, Westminster.

The Manchester City Council on Wednesday sanctioned a number of departmental schemes which have either been devised or expedited for the sake of providing public employment now and in the immediate future. These projects include a new south road from Longsight to the Cheshire boundaries of Manchester, and the purchase and conversion into a park of the Barlow Hall estate, near Chorlton-cum-Hardy. The council also approved of the decision of the gas committee to give £10,000 out of its reserve fund to public purposes connected with the war—part of it to the equipment of the new Manchester Battalion and part to the Local Relief Fund; also of the proposal of the education department to adapt Bank Hall, Heaton Mersey, as an open-air residential school, at an estimated cost of £3,834. Then they sanctioned the proposal of the rivers department to go forward with certain main drainage works, at a cost of £15,000. Approval was expressed also—although by but a small majority, which was gained on a technical point—of a housing scheme for artisans on the Temple estate, Chorlton, costing over £30,000. A proposal to spend £16,500 on extending the lake in Heaton Park was, by general consent, postponed. The highways committee's proposal to spend over £14,000 in sewerage, levelling, and paving work was sanctioned.

The corporation of Stoke-on-Trent have resolved to commence forthwith the execution of various public works in the federated towns at a total estimated cost of £52,150. The aim is to provide three days' employment per week to applicants at a rate of 3s. 3d. per day of eight hours. The following are the works to be undertaken under the scheme:—Tunstall: Private street works, estimated cost of labour, £564; diversion of sewer, Scotia-road, £300; diversion of sewer, Victoria-road, £140; public park, Goldenhill (subject to consent from one landowner), £6,710. Burslem: Widening of High-lane, £514; new road, Federation-road, £4,171; private street works, £1,170; levelling tip, Porthill-road, £536; paving and storm-sewers, Waterloo-road, Wedgwood street, and Scotia-road, £1,648; storm-water drainage scheme, park districts, £3,544; reconstruction of sewer, Back Sych, £100. Hanley: Private street works, £28; removal of spoil-heap, electricity works, £154. Stoke: Widening and storm-sewers, Trentham-road, £760; private street works, £106. Fenton: Private street works, £316; new park, cemetery-road, £11,502. Longton: Diversion of Stone-road by Florence Colliery, £1,600; private street works, £502. Sewage Departments: Renovation of bacteria-beds at Burslem, Hanley, and Longton, £800. The works will be carried out under the direction

of an advisory committee of three members of the corporation from each of the towns.

The City and Guilds of London Institute announces that students of technological classes and others preparing for any of the examinations of the Institute's Department of Technology will not, so far as possible, be prejudiced in competition for certificates and prizes, if they have been prevented from fulfilling the Institute's regulations as to attendance at classes or otherwise, by reason of their having joined the military forces of the Crown, or having accepted temporary civil employment in connection with the defence of the country.

The Associated Portland Cement Manufacturers (1900), Ltd., have issued the following notice:—Portland House, Lloyd's-avenue, London, E.C.—Notice to Single Men.—Any unmarried man between the ages of nineteen and thirty is urged at once to offer himself as a recruit to his Majesty's forces under Lord Kitchener's appeal. In the event of his being accepted, the company will add to his pay from the Army 5s. per week during continuance of the war whilst serving with the colours, and work will be found for him on his return. Notice is further given that, owing to the restricted output of our works and the notice already issued that preference would be given to married men, the services of single men having no dependants entirely dependent upon them for support will have to be dispensed with after September 12 next. This notice applies to all men unmarried at the date of this notice.—By order of the Board, August 26, 1914.

The Bosch Magneto Company, Ltd., of Tottenham Court-road, and John A. Stevens, the secretary, were summoned at Bow-street Police-court on September 1 for refusing to permit an inspection of the company's register of shareholders. For the defence it was stated that when the complainants called Mr. Stevens was busy with Government officials over work for the War Office. The company dealt in magnetos for flying-machines, and their business was practically in the possession of the Government. Mr. H. D. Warner, who supported the summonses, said that when the complainants were ultimately allowed access to the register they found that of the 50,000 shares of the company all but two were held by Germans. The magistrate imposed fines and costs amounting to £8 4s.

It seems that Siberia, in the near future, may become a formidable rival to Canada in the supply of timber to the markets of the world. It is scarcely three years since a first consignment of Siberian pine, or cedar, as it is sometimes termed, made its appearance at Hamburg from Vladivostok. Since then the exports of pine timber from Siberia have increased rapidly, not only to Germany, but also to England, Australia, China, and to other parts of the world.

The closing of the Baltic ports and the shortage of labour in the Bordeaux district of France have greatly reduced the normal supply of pit-props. As the provision of an adequate supply of mining timber is of great importance, the Board of Agriculture and Fisheries, in co-operation with the English Forestry Association, are taking steps to stimulate the marketing of home-grown timber. The timbers most in demand are larch, Scotch pine, and spruce of 3in. diameter and upwards at the small end; but small hardwood timbers such as oak, coppice, and beech are used to some extent. The standard lengths of pit-props differ in the various districts. In view of the fact that the larger sizes of timbers may be more usefully employed for other purposes, it is probable that thinnings provide the most remunerative source of pit-props. Owners of extensive woods who may have timber which they consider suitable for this purpose, but who are in doubt as to the best method of marketing it, or of timing it with least damage to the future welfare of their plantations, are invited to communicate at once with the Secretary of the Board of Agriculture and Fisheries, or with the Secretary, English Forestry Association, Farnham Common, Slough, Buckinghamshire.

Bulkheads for tunnel-forms are always difficult to build because of the roughness of the rock profile. The Pneumatic Concrete Placing Company, of New York City, who are specialising in tunnel-laying work, have been experimenting to find a suitable way of building such bulkheads quickly and cheaply, and have found that cement-sacks three-quarters full of sand can be used successfully. The sacks are laid on top of each other in the same way as bricks in a wall, and can be fitted into all crevices of the rock, following closely the irregularities of the profile. One unskilled labourer placing sacks replaces two carpenters building forms. A bulkhead formed in this way is tight, and is left in place the same length of time as a wooden one. When the sacks are removed the concrete surface is rough and gives a good bond with the adjacent section.

Mr. George H. Blasgrove, writing in the R.I.B.A. Journal, states that he has been engaged for some months past in testing mild steel manufactured by various Scottish firms. He has selected, from nearly 300 tests, eleven made upon steel less than .3in. thick, and thirty-two made upon steel varying from .3in. to 1 1/2in. thick. In the samples under .3in. in thickness the ultimate tensile resistance in tons per square inch averaged 29.8, and the percentage of elongation in Sin. of length averaged 23.2; from .3in. to 1 1/2in. the average ultimate resistance in tons per square inch was 29.6, and the percentage of elongation was 25.9. So far as this evidence goes, it would appear that no advantage is gained in construction by employing several small-dimensioned members of mild steel in place of a few larger-sized ones, the latter being, of course, more economical.

Mr. R. F. Gilder has issued a catalogue of the remains discovered in the course of a survey conducted by him of a series of prehistoric dwellings in Douglas and Sarpy Counties, Nebraska. They were believed to be depressions caused by bison wallowing in the mud, but are now proved to be of human origin. Along the Missouri river as far as the Platte some forty ruins have been explored, and the specimens collected are now deposited in the Omaha Public Library Museum. The collection consists of numerous articles made of bone and deer-horn, pottery, prehistoric pipes, and various ornaments. The most remarkable object is a human head carved out of pink soap-stone, which is believed by some competent archaeologists to be unique among American collections.

Mr. W. W. Pearce, who was recently appointed City Architect of Toronto, was born in that city forty-two years ago. He took a five-year course in connection with the Ontario Association of Architects, on the completion of which, at the age of twenty-two, he went to New York. He obtained the degree of Bachelor of Science after a five-year course at Cooper Union, and also the post-graduate degree of Civil Engineer. Continuing his studies, he took a special three-year course in German methods of engineering. Amongst important buildings the structural work of which has been carried out under his supervision mention may be made of two armories in New York; the Traders and Importers Building, in that city, of eighteen stories; five theatres, of which two of the largest are the Broadway Theatre, Brooklyn, N.Y., and the Earl of Arundel, New York. He has acted as the engineer for some of the most prominent architects of New York, including Messrs. Ross and Goldstone, Messrs. Foster and Gady, Mr. Wm. B. Tabby, Mr. Elliott Lynch, and Messrs. Summerfeldt and Steckel. For the last-named firm of architects Mr. Pearce has carried on the engineering work connected with a number of the twelve, sixteen, and twenty-story buildings erected by them in New York.

A large water scheme is contemplated on a farm near Ventersdorp, in the Cape Province of South Africa. It is proposed to build a dam or weir across the Zuurberg Spruit at a cost of £15,000. It is anticipated that this will give all farmers below the dam water for 200 acres once a fortnight. The scheme has been favourably commented on by experts.

MEETINGS FOR THE ENSUING WEEK.

SATURDAY (To-morrow).—Royal Photographic Society's Exhibition, Suffolk-street Galleries, Haymarket, S.W. "St. Paul's Cathedral, Past and Present," by F. J. Hall, 8.30 p.m.
 SATURDAY (SEPT. 12).—Institution of Municipal Engineers. Meeting of the Northern and Yorks Districts at Harrogate.

Trade News.

WAGES MOVEMENTS.

QUARRYMEN'S WORKING DAYS.—The Oakeley Quarries, the largest quarries in Festiniog, have reduced the working days to three a week, and Llechwedd, the next largest, have reduced to four days a week. Some of the other quarries are working full time, but have been compelled to discharge a number of workmen. The Festiniog Board of Guardians has resolved to appeal to the Local Government Board to advance money by way of share capital to the slate quarry proprietors.

The French Government has purchased Mr. Cecil C. P. Lawson's picture, "La Sortie de Moscow, 1812," which was exhibited in this year's Salon.

The Ashford road for a considerable length close to Faversham is being widened, the work having just been put in hand by the county council, who are spending about £1,100 upon it.

The parks and baths committee of the Preston Corporation advise that authority be given to approve plans for the erection of new baths in Sault-street at a cost of £20,000.

Mr. James Wharton, of Grafton House, Grafton-road, Keighley, builder and contractor, mayor of the town in 1909, who died in August, aged 52, left £18,419 gross and £9,148 net personalty.

The Goole Urban District Council decided on Monday to proceed with the preparation of a large plot of land conveyed to the town by the Aire and Calder Navigation with a view of laying it out as a public park.

A new Roman Catholic church of St. Joseph, built in Tangier-road, Copnor, has been opened. The architects were the Very Rev. Canon A. J. C. Seobes and Mr. Raymond, of Basingstoke, and Mr. Farrall, of Southsea, was the builder.

At Southend-on-Sea, on Tuesday, an inquiry was held by Mr. T. C. Ekin, an inspector under the Local Government Board, into an application from the town council for sanction to borrow £60,000, for the extension of the electricity undertaking.

The work of re-hanging the bells in the parish church of Sandford-on-Thames on a new wrought-steel framework has been completed by Messrs. Webb and Bennett, of Kidlington, and a service of rededication took place on Sunday, when the Archdeacon of Oxford officiated.

New council schools in Lynnhurst-road, North End, Portsmouth, built at an outlay of £19,000, have been formally opened. Mr. J. W. Wilmsley, F.R.I.B.A., F.S.I., of King's-terrace, Southsea, was the architect, and Messrs. Tanner Bros., of Southsea, were the contractors.

The Rev. Canon Owen W. Davys, for fifty-five years rector of Wheathampstead, who died on Thursday, aged eighty-five, was formerly hon. secretary to the Cambridge University Architectural Society and to the St. Albans Archaeological Society. He was the author of "An Architectural and Historical Guide to St. Albans Cathedral," which has passed through several editions.

In pursuance of the Board of Trade scheme for assisting British manufacturers and traders to secure trade with British Possessions and foreign countries formerly in the hands of their German and Austrian or Hungarian competitors, bulletins on linoleum and oilcloth and on pumps and pumping machinery were issued on Wednesday by the Commercial Intelligence Branch of the Board, 72, Basinghall-street, E.C.

A local Act has been passed authorising the corporation of Weymouth to carry out public works of improvement, and, in accordance with the directions of the Local Government Board, they are to be expedited in order to provide employment during the winter and alleviate much of the distress resulting from the war. The first scheme to be proceeded with is a portion of the development of the Beckwater, a tidal estuary of 250 acres, by the construction of an embankment road across it, towards which the Local Government Council is finding nearly £14,000. The Weymouth Corporation is pushing ahead with this undertaking with all speed.

LATEST PRICES.

N.B.—All prices must be regarded as merely approximate for the present, as our usual sources of information are in many cases failing us. Miscellaneous metals and timber we omit altogether, as published figures differ so widely that they are, we fear, in many cases quite unreliable.

Valley tiles	3	6	"

STONE.*

Table listing stone types and prices: Red Mansfield, in blocks; Darley Dale, ditto; Red Coraehill, ditto; Closeburn Red Freestone, ditto; Ancester, ditto; Greenshill, ditto; Chitmark, ditto (in trunk at Nine Elms); Hard York, ditto; Do. do. 6in. sawn both sides; Lendinge, random sizes; Do. do. 3in. slab sawn two sides, random sizes.

* All F.O.R. London.

Table listing stone types and prices: Bath Stone, delivered on road waggons, Paddington Depot; Ditto, ditto, Nine Elms Depot; Beer Stone, delivered on rail at Seaton Station; Ditto, delivered at Nine Elms Station; Portland Stone, in random blocks of 20ft. average; Delivered on road waggons; at Paddington Depot; Nine Elms Depot, or; Pimlico Wharf.

BRICKS.

(All prices net.)

Table listing brick types and prices: First Hard Stocks; Second Hard Stocks; Midd Stocks; Picked Stocks for Facings; Flettons; Pressed Wire Cnts.; Red Wire Cnts.; Best Fareham Red; Best Red Pressed Ruabon Facing; Best Blue Pressed Staffordshire; Ditto Bullnose; Best Stourbridge Firebricks; 2 1/2 in. Best Red Ac-crington Plastic Facing Bricks; 3 1/8" Accrington Best Red Plastic Facing; 3 1/8" ditto Second Best Plastic ditto; Ditto Ordinary Secondary Bricks; Ditto Plastic Engineering Bricks; Sewer Arch Brick; 3 1/8" Chimney Bricks; 3 1/8" ditto ditto through and through; 3 1/8" Beaded, Ovolo and Bevel Jamb; Octagons; Accrington Air Bricks; Accrington Camber Arches; 3 course deep; 4 ditto; 5 ditto; 6 ditto; 4 ditto; 5 ditto; 6 ditto.

GLAZED BRICKS.

HARD GLAZES (PER 1,000).

Table listing glazed brick types and prices: White, Ivory, and Salt Glazed; Buff, Cream, and Best; Other Colours; Second Colours; Stretchers; Headers; Double Stretchers; Double Headers; One side and two ends, square; Two sides and one end, square; Splays and Squints; Plinth and Hollow Bricks; Double Bullnose, Round Ends, Bullnose Stops; Rounded Internal Angles.

MOULDED BRICKS.

Table listing moulded brick types and prices: Stretchers and Headers; Internal and External Angles; Sill Bullnose, Stretchers, and Headers; Majolica or Soft Glazed Stretchers and Headers; Compass bricks, circular and arch bricks; Camber arch bricks; Stretchers cut for Closers and Nicked Double Headers; Thames Sand; Pit Sand; Thames Ballast.

Table listing cement and lime types and prices: Best Portland Cement; Ground Blue Lias Lime; Grey Stone Lime; Stourbridge Fireclay.

OILS.

Table listing oil types and prices: Rapeseed, English pale; Ditto, brown; Cottonseed, refined; Olive, Spanish; Seal, pale; Cocoonut, Cochín; Ditto, Ceylon; Ditto, Msuritina; Palm, Lagos; Ditto, Nut Kernel; Oleine; Sperm; Lubricating, U.S.; Petroleum, refined; Tsr, Stockholm; Ditto, Archangel; Linseed Oil; Baltic oil; Turpentine; Putty (Genuine Linseed); Oil; Pure Linseed Oil; "Stority" Brand.

GLASS (IN CRATES).

Table listing glass types and prices: English Sheet Glass; Fourths; Thirds; Fluted Sheet; Hartley's English Rolled Plate; Figured Rolled and Repoussé.

VARNISHES, &c.

Table listing varnish types and prices: Fine Pale Oak Varnish; Pale Copal Oak; Superfine Pale Elastic Oak; Fine Extra Hard Church Oak; Superfine Hard-drying Oak; Fine Elastic Carriage; Superfine Pale Elastic Carriage; Fine Pale Maple; Finest Pale Durable Copal; Extra Fine French Oil; Eggshell Flatting Varnish; White Copal Enamel; Extra Pale Paper; Best Japan Gold Size; Best Black Japan; Oak and Mahogany Stain; Brunswick Black; Berlin Black; Knoching; French and Brush Polish.

TRADE NOTES.

Boyle's latest patent "Air-pump" ventilator has been applied to the Baptist Chapel, West Hendon, N.W.

Claridge's asphalt is being used on the roofs of Preshaw House, Upham, Hants, and Great Oak, Goring Heath, under the instructions of Messrs. Crickmay and Sons, and Mr. F. L. Pearson respectively.

In harmony with other large employers of labour, Messrs. Robert Ingham Clarke and Co., Ltd., have decided to place on half-pay all employees and workmen joining the colours, and to reinstate them upon the termination of the war.

"Clarmic" is the description given to the slag tarmacadam which is being made by Clarmic Roads, Limited—a new company affiliated with Claridge's Asphalt Company, Limited. Roads in Clarmic have been laid at Southend-on-Sea, Coventry, and Newcastle-under-Lyme, with, we hear, very successful results.

A tower and spire are to be added to a church at Roscommon. The architects are Messrs. O'Callaghan and Webb, of South Frederick-street, Dublin.

The city council of Lincoln have received the sanction of the Local Government Board to a loan of £1,100, for the purchase of land adjoining the corporation depot.

The partnership hitherto subsisting between J. R. Webster and H. P. Hawkes, builders and contractors, Broomhall-road, South Croydon, under the style of Webster and Hawkes, has been dissolved.

The urban district council of Walthamstow have decided to apply to the Board of Trade for permission to expend £3,317 in carrying out tramway extensions in Chingford-road and Markhouse-road.

The parks committee of the Manchester Corporation have decided to extend the lake in Heaton Park by 6 1/2 acres, bringing the total area up to 29 acres. The cost is estimated at £16,000, of which 70 per cent. will be for labour.

Telephone: DALSTON 1388.

TENDERS.

** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender; it adds to the value of the information.

BALLYMENA.—For building engine house at workhouse, for the guardians, Mr. F. D. Brown, 93, Anan-street, Belfast, engineer:—

Table listing tenderers for engine house: Hewitt, R., and Son, Sandown-road Belfast; McKay, J., Ballymena; Dowling, W., Crownwell-road, Belfast (accepted).

BEDFORD.—For repairs at various council schools, for the education committee, Mr. R. K. Ellison, surveyor:—

Table listing tenderers for Bedford repairs: Allen, M. J., Safron-road, Biggleswade; Wade, W., Eaton Ford, Beds; Mayes, H., Eaton Socon; Laughton, Midland-road; Sharp, C., Flitwick; Wright, C., Langford; Allen, M. J.; Corby, J., and Son; Laughton, W.

Table listing tenderers for Bedford repairs (continued): Nicholls, S., Coppe; Allen, M. J.; Foster, S., Kempston; Freshwater, S., and Son; Dawes and Bowler; Corby, J., and Son.

BEDWORTH.—For building thirty houses for workmen at Bedworth, for the Foleshill Rural District Council:—

Table listing tenderers for Bedworth houses: Smith, J., Bedworth (accepted); Lowest tender received.

BEDWORTH.—For the construction of two detritus tanks, screening chambers, and sludge lagoons at the sewage outfall works, Marston-lane, Bedworth, for the Foleshill Rural District Council:—

Table listing tenderers for Bedworth sewage works: Kelly and Son, Foleshill; Gibson, T., Bedworth; Smith, J., Bedworth (accepted); Trentham, F.

BUNGAY.—For the supply of 345 tons of 1 1/2 in. Mount Sorrel Granite, for the urban district council:—

Table listing tenderers for Bungay granite: Lavender and Bateman (accepted); 12s. 11d. per ton.

CLWTYBONT.—For building thirty-six workmen's dwellings in the quarry village of Clwtymbont and Ebenezer, for the Gurfayal Rural District Council:—

Table listing tenderers for Clwtymbont dwellings: Williams, Brothers, Brynthur; (Accepted. Six tenders received.)

CWMSYFLOG.—For the reinforced concrete work in the construction of three reservoirs of 100,000 gallons, 240,000 gallons, and 100,000 gallons capacity at Cwmsyflog, Coedymoeth, and Cefn Rhydyddir (New Tredegar) respectively, for the Bedwelly Urban District Council. Mr. Dan H. Price, Aberbergoed, via Cardiff, engineer:—

Table listing tenderers for Cwmsyflog reservoirs: Hayward and Wooster, Bath (accepted).

EARLESTOWN.—For the materials and labour required in streets and passages within their district, for the Newton-in-Makerfield Urban District Council. Accepted tenders:—

Table listing tenderers for Earlestown streets: Webster and Winstanley, Wigan; Bennie & Thompson, Warrington.

EDGEMONT.—For alterations and additions to the workhouse laundry, for the guardians:—

Table listing tenderers for Edgemont laundry: Rowlett Bros., Palmers Green; (Recommended for acceptance.)

FOLSHILL.—For the erection of thirty workmen's houses at Foleshill, for the Foleshill Rural District Council:—

Table listing tenderers for Foleshill houses: Train, W., & Co., Ltd., Nottingham (accepted); Lowest tender sent in.

HAMILTON.—For alterations and additions to the administrative block at the county sanatorium, Louisa-road, Messrs. A. Cullen, Leith, and Brown Hamilton architects. Accepted tenders:

Table listing tenderers for Hamilton block: Maxwell, J., and Son, Falkirk; Shanks, W., and Sons, Ardrie; Johnston, D., Strathaven; Thom, M., and Co., Ardrie; Young, J., Bellshill.

THE GENESIS OF DESIGN.

In a state of order, all things stand in reciprocal relation; law connects part with part, and part with whole. In practical design our drawing-boards insure, mechanically, correlation to a certain limited extent; for each horizontal drawn with tee-square is true to base, each vertical is at normal angle. In earlier days, no doubt, the designer wanting accurate mechanical aids would have needed to exercise his mind in maintaining true horizontal and vertical, just as the mason constantly applies line and plummet. It may be that this necessity for continual vigilance gave a certain nobility to the work of the designer in primitive times; that his self-reliance was fostered, and forcefulness and character were engendered. We need but casually look round to assure ourselves that our present-day excellence of instrument and appliance does little to open the eye to an understanding of true symmetry and grace of form; for assuredly we see no end to the production of disorderly and warped architectural mass. We may agree that the basis of design is order, and that order means correlation of part; but the worship of the so-called picturesque in place of quiet dignity, shows that in practice we frequently ignore fundamental principles to which, in theory, we profess allegiance. This is a matter of regret, since if we earnestly seek some main guiding rule in design, we may find it in the principle of correlation, whereby each thought and act in design has definite relation to some overruling master idea. Holding to this principle, we may be saved from wanton acts, destructive of unity, and make each thought observe a general thesis. Each act of design is then comparable to a line drawn with tee-square; it is made true to a base. In the sum, such acts correlate, are laid, as it were, course on course, to line and plummet.

If we inquire why mere geometrical correlation, mere placing of objects at equal distances, at certain angles, on certain balanced curves—why parallelism, co-ordination and concentricity alone, of themselves are causes of interest to the eye and convey a sense of beauty, we shall find these questions in great part answered, if we consider correlativeness as the essence of order, and order the genesis of design. Each part has reference to other; the whole is bounded and bonded by a common, all-dominating law. Whether it be jewelled pendant, concentric circle in rain-splash and ripple, or iso-curving wavelets in a wide-sweeping bay, beauty in major part seems to reside in the sense of order, the

existence of law, and the general subservience of part to whole effect. Geometry, as such, we may conceive to have no aesthetic import; but geometry as signifying law and order, and as indicating reciprocal relation of part, such as we see demonstrated in equidistant columns and the regular spacing of flutes, is no doubt the hidden cause—the fount and origin of beauty in architecture.

Geometry, as a concrete expression of order, appears rather an attribute than an entity in architecture. The display of severe elemental geometric form itself is not the aim. The orderliness and correlativeness of geometry runs through and through architecture as bond-entwining correlativeness—order; but if the end and aim of architecture were merely the exhibition of geometrical form, as such, and the ultimate effects were governed by this, plain iron sheds would be types of architectural beauty! When, therefore, we set so much store on order and correlativeness and the super-domination of the geometrical, we refer rather to an invisible warp and weft intermeshing and bonding part and part into unity.

There may be nothing of special interest, and, obviously, no novelty, in displaying the circle, as such; yet all objects of art founded on the circle possess its inherent beauty, and have an interest born of out-coming from—the circle. The relation of part to whole—the correlation, or sign of order, is here at its simplest: all refers to a centre, be it ring, wheel-window, or round moon. In the wheel-window the mullions may radiate, bringing another feature of design under one law; but the wealth of varied interest that the Mediæval builders threw into circular windows shows that, given the circle as frame, the greatest prodigality and play of line and curve, within the circle, do but add gravity of effect. This is but natural, and an affair of mutual enhancement. The four straight and square lines that define a marble panel are the foil and contrast whereby the utmost value is given to all its natural, asymmetric markings and figure.

These considerations suggest that even order—correlativeness—needs some counterfoil; that is to say, reciprocal relation may be heightened in value by the juxtaposition of something akin to disorder. It seems almost impossible to employ such a term in design; but wild asymmetry, as the figuring of marble, does unquestionably derive increased value from close proximity to severe and simple geometrical lines. We must allow a place in architecture to the grave and gay, just as we employ the bass and treble in music. If

we give too great heed to geometrical disposition; if our design is all right lines and right angles, we gain dignity, but lack variety. For the designer, this is a consideration of importance, for it shows that even order itself requires foil or contrast, and that the plumb and square parts of ruined architecture appear more so in the face of decayed and crumbling litter; and the spirit of the same principle we may see where right-angled leaden lights frame and empanel lace curtains and the flowering plants of cottager's window.

The principle of correlation induces us to render more pronounced and apparent geometrical form; but the need for variety and foil warns us not to carry the rule too far. If we never go outside our principle, or rather, if we never allow a little play of fancy and abandon, all lightness—the magic and charm of variation—would be stifled. All we need to see is that the change and variation does not occur in weighty matters; that we do not play with form in grave and serious main masses of building. It is in careless treatment of such building masses that want of respect for our principle of correlation—want of a high sense of order—is mainly evidenced. In the preservation of simple mass resides dignity. If we believe that order is reciprocal relation of part, we shall carefully avoid senseless break and change. Looking back into the ages, we shall find ample confirmation in support of these views. All great works convey an impression of a high sense of order, of overruling law, and, in each, a dominating theme or idea, to which every thought and effort of the designer has been subservient.

THE EXHIBITION OF THE LONDON SALON OF PHOTOGRAPHY.

The council of the London Salon of Photography have successfully overcome unprecedented difficulties in organising their international exhibition, which has just opened at the galleries of the Royal Society of Painters in Water Colours, 5a, Pall-mall East. Many of the Continental contributions have been withheld or unavoidably detained en route; one case of thirty prints in the oil process, the work of Demachy and Puyo, advised from Paris three weeks ago, have so far failed to be delivered, and a parcel of exhibits by leading American amateurs are missing, although they were consigned from New York six weeks since, and the covering letter and list of works and their authors came to hand a month ago. Further, the council decided to only hang one example of each German

and Austrian artist, and in no case to quote a selling price for these. Notwithstanding all these drawbacks, the display is an excellent and representative one; the number of accepted pictures—325 in all—falls short of recent years, but the works are better hung, and several screens are also utilised. There is a boldness, vigour, and healthy sanity about the exhibits, and foggy and indecipherable impressionist works are in a small minority. There is an exceptionally strong display of portraits, both by amateur and professional members. The colour prints on paper increase in relative numbers year by year, and now evince great delicacy and refinement; but no new process has come to the front this autumn. English and American works are well represented, and there is a fair show of French and Belgian photographic art.

The very first picture to catch the eye upon entering, No. 1 in the catalogue, is of a topical character, and is sure to awaken interest. It is entitled "The Empire's Watchdog," and is one of two seascapes by F. J. Mortimer; the ocean is lashed into fury by the gale under a darkening sky, and angry billows dash against the armed prow of a British cruiser, on which, behind the quickfiring guns, are a lieutenant and an A.B.; the latter, telescope to eye, is looking through the spray at a couple of destroyers in the offing. "Touch and Go," the same artist's second work, is a vessel under closely-reefed sails beating up against the wind. In this class may be placed No. 100, bearing the suggestive title, "England Expects—" by Hector Murchison; over the housetops we look upon one of the Leemings' square Admiralty cupolas, with its wireless masts and antennae, and beyond is the upper portion of the Nelson column, the whole well composed as a picture. No. 3, by A. E. Schnaf, "Pennsylvania-avenue," is a peep into a typical New York street on a rainy day. "The Smoky River," by J. Kauffman, No. 8, shows a liner and smaller vessels working up Port Phillip Bay towards Melbourne. No. 10, "Cloud Shadows," has a fine atmospheric effect; the clouds overhang a long and barren valley between limestone hills; it is the work of Kenneth C. Goodyear. "The Fountain," by Alfred G. Buckham, No. 14, has obviously had the cascade worked up, and the same criticism applies to No. 230, "Neptune's Fountain," a much more elaborate and ambitious work by J. C. Warburg; in the latter print a charming effect is gained by the dexterous delineation of symmetrically feathered spray from some finely-modelled tritons sporting themselves in a basin below a Classic portico. A. G. Buckham also contributes No. 15, "Overhead the Moon Sits Arbitress," a clever but indistinct night scene; the long stretch of white lane between the lamp-lit cottages would have been more artistic had it possessed a turning. "The Return from Flodden," No. 19, by John M. Whitehead, of Alva, N.B., shows a knight in armour standing on a hilltop waving a brand-new flag on a short staff. Other exhibits by this worker of much excellence are "Storm Clouds," and "A Moorland Farm," Nos. 20 and 22, the latter a white-walled homestead seen beyond the sand, sedge, and sludge of a dreary marshland. Four futurist works of considerable merit are Nos. 25 to 27 and 31, sent in by Hugh Cecil; perhaps the best is "The Snake Dance." A clever effect of low-lying plants in flower, foliage, meadow, and trees is obtained by Dr. R. E. Evans (No. 35). "Wedding the Cobbles, Dammie," by W. W. Smith, No. 36 is not a self-condemnatory explanation of the worker's occupation, as might be hastily surmised from the title, but merely a quiet scene in a Dutch village

street. We always expect good things from Mrs. Carine Cadby, and her "Ski-er," No. 37, is not disappointing; it shows a well-dressed maiden, in the flush of health, descending a steep snow-slope, while across the valley is a still more lofty glistening mountain. In No. 40, "A Member of the London Salon of Photography," Pierre Dubreuil, a French amateur, gives us a characteristic self-portrait, shown in the act of setting a camera. Another good print by Dubreuil is "Hours of Paris," No. 44, a rainy-day scene, looking along the Rue de l'Opéra towards the main façade of Charles Garnier's masterpiece; an open umbrella held over the photographer obscures the sky to the right, producing a unique but not unpleasing effect. In "A Friend of the Friendless," No. 51, W. J. Clutterbuck depicts a middle-aged dame walking along a dirty street on a miserable evening, and behind her slink three disreputable mongrels. No. 53, "Twilight, Chenies," by J. L. Tucker, shows with no small skill the bare trunks of pines and beeches above a still stream; the grain of the process is a little too prominent for our liking; and another quiet landscape by this artist hangs near it, "Autumn Afternoon, Chesham," No. 60. Bertram Park, the energetic secretary of the London Salon, is this year represented by three admirable platinotypes: No. 64, a "Profile" portrait; No. 65, a problem-picture, "The Sultan's Pleasure": a brunette in the flimsiest Oriental costume (à la Miss Maud Allan) shrinks against a pillar, while on the stairs and wall to the right appears the silhouetted shadow of the houri's despotic lord and master: his third work, "Laugh, laugh, Oh; Hotei" (No. 6) portrays a Japanese idol, the god of levity and pleasure, being tickled by a girl with a peacock's feather. No. 67, by J. B. Portway, sen., is a powerful representation of "Whitby Bay," and Fred Judge sends as one of five "A Whitby Yard," No. 91, one of the narrow courts off the hillside below the church. Alexander Keighley, of Keighley High Hall, contributes this year four Egyptian subjects, Nos. 67-70, all conveying the impression of a cloudless atmosphere and sharply-defined arid landscapes. In No. 72, "The Pottery Kiln," we see the clayworkers' sheds and bricks on the plain below a minaretted mosque. No. 85, "St. Paul's," by F. Seyton Scott, obtains a fine contrast between the lichen-clad protected masonry and the white surface of the Portland stone where exposed to sun and rain in a portion of the south portico of Wren's cathedral. No. 104, "Tothill-street," by A. H. Blake, M.A., is a clever birdseye looking down that busy thoroughfare upon the west front of the Abbey and a third metropolitan subject of uncommon merit, is "Constantinople in London," No. 109, also by A. H. Blake, in which, with the Duck Island in St. James's Park as a foreground, the artist dexterously groups the medley of minarets and turrets of Kent's Horse Guards, Webb and Bell's United Service Museum, William Young's War Office, Archer and Green's Whitehall Court, and Alfred Waterhouse's National Liberal Club into an harmonious Oriental mise-en-scène. No liberties are taken with the rearrangement of the buildings; all is simply effected by a careful selection of viewpoint and the camera does the rest. No village on the Lower Seine has been more often sketched and photographed than "Candebee." John H. Anderson, in No. 116, shows neither the Flamboyant open spire nor the riverside aspect, but depicts a narrow street, with dilapidated, timbered houses, cobble paving, and some carts and peasants. No. 127, "The Erlöser Church in Moscar," by S. Laurason, of that city,

gives us the uncouth cupola seen over a balustrade. The expression of the strong face of "Sir Ernest Shackleton" is well caught by Rudolf Dührkoop, of Hamburg (No. 132), and H. S. Ponting's work with Captain Scott's Antarctic Expedition is admirably illustrated in Nos. 205 to 208; of these four, the most impressive in its grandeur is No. 208, "The Castle Berg," in which a huge perpendicular snow-clad cliff of ice towers above a plain, along which a team of dogs drag an explorer in his sledge; "The Terra Nova Icebound in the Pack," No. 207, suggests the helplessness and solitude of the intrepid party. Ward Muir, in Nos. 150-1, brings before us "Edinburgh in Summer and in Winter," the former representing the Mound, and the latter Waverley Market. An unlovely vision of hard-lined skyscrapers is "Sixth-avenue, Pittsburgh," No. 161, by H. C. Torrance. Four pastoral scenes in Belgium are shown by Leonard Misonne, of Gilly; No. 165, "Lever de Soleil," indicates the dispersal of mist from a marshy woodland, and a neighbouring print, "Les Grands Peupliers," shows a flat riverside bordered by poplars and willows. Frederick H. Evans again takes us to Westminster Abbey, showing us in the "Buckingham Tomb" the effigies in profile of Sir George and Lady Villiers, by Nicholas Stone, in the centre of St. Nicholas Chapel; of a different class is his portrait of "Hubert," of the *Sunday Chronicle*, the late Hubert Bland (No. 197). William Rawlings, in "The White Cliff," No. 199, gives us the green slope and white chalk face of Beachy Head, as seen from the west, with the banded, toylike shaft of the new lighthouse on the foreshore below. Bertram Cox, in No. 215, "Lincoln from the South West," shows the long roofs and triple towers of the Minister and the Castle turret, as viewed from across the Witham Valley and river. Samuel Grimshaw succeeds in making an attractive picture of an uncompromisingly modern subject, "The Technical School, Aston-under-Lyne," No. 220, by taking its square tower in shadow against the sky on a wet evening, when reflections are produced by the puddles and wet paving sets. "The River of Toil," by Egon Ratibor, of Winnipeg, No. 235, is also a poor topic; but the treatment is flat and unsatisfactory from the pictorial standpoint. Four Dutch genre scenes by Richard Polak, of Rotterdam, No. 246-9, are exceedingly well-grouped, and the wealth of detail is brought out with the sharpness of definition of one of the worker's countrymen among the old masters; but it would have been better not to have engaged the same buxom woman as model in three instances, hung side by side, or otherwise the resultant prints should have been hung in different years. "Dusk in Kelvin-grove," No. 253, looks up to Sir Gilbert Scott's Glasgow University buildings, and is a good example of John D. Stephen's work, and Charles H. L. Emanuel makes the best of a picturesque topic in his "Corfe Castle," No. 265, seen from the green below the mound. One of the best Alpine scenes is No. 290, "Sunshine and Mist," by Elliott Peel, from a steep slope of snow we look across a fine-clad valley to still loftier peaks. J. Craig Annan gives in No. 286 the results of a visit to Toledo, with its narrow streets, round walls, and water carriers; and Alexander Hamilton, in No. 307, shows the main street, west front and twin towers of "Quimper Cathedral." Brittany, with a fine atmospheric rendering of the clouds above. Perched like an eagle's eyrie on the edge of a cliff overlooking a wide expanse of fair country is "The Kaiser's Chateau," No. 301, by Fred Boissonnas.

It will be seen that the display will well repay one or more visits. The entire

profits of the exhibition, which will remain open daily from 10 a.m. till 6 p.m.; also on Wednesdays and Thursdays till 8 p.m., for six weeks, closing on October 17, will be devoted to the Prince of Wales's National Relief Fund, and in order that this contribution may be worthy of its purpose, we understand various economies have been adopted, including the discontinuance of the popular evening lectures.

ST. PAUL'S CATHEDRAL. PAST AND PRESENT.

At the Royal Photographic Society's Exhibition in the Suffolk-street Galleries, Haymarket, S.W., on Saturday, a lecture on "St. Paul's Cathedral, Past and Present," was delivered by Mr. F. J. Hall. Mr. A. H. Lisett, treasurer of the society, occupied the chair. The lecture was copiously illustrated by photographs of the highest quality, all taken by the author, by permission of the Dean and Chapter, who granted special facilities to visit otherwise inaccessible places and also to reproduce many literary treasures in the library.

The first half of the lecture dealt with "Old Powles," the third cathedral on the site, of which the nave was Norman and the choir and Lady-chapel Decorated in style. The tall central spire, built of timber and lead, was not completed till 1315 and was finally burned down in 1561. The close wall, the outlying chapels, the cloisters, Paul's Cross, demolished in 1643, and other subsidiary structures, were described and illustrated. The interior of Old St. Paul's was, Mr. Hall remarked, no less magnificent than the outside, with its many beautifully decorated altars, shrines, and images, with its tombs of saints, kings, and heroes, and with places of pilgrimage well worn by the feet of the devout. Arcades of clustered columns divided the nave and choir from the aisles and ran the full length of the edifice. Separating the choir from the nave, which were of equal length, was a fine screen, ornamented with statues placed under canopies. No church in Great Britain was so highly decorated as was this cathedral, and the magnificent internal and external architecture, the splendour of the interior, and the graceful and lofty spire left little to be desired. The author sketched many of the important ceremonies which took place in the old cathedral, observing that it was not generally realised what a large part St. Paul's played in the making of England. The most magnificent piece of work in Old St. Paul's was the shrine of St. Erkenwald, which stood near the altar, and was very richly carved and gilded. The tomb of Sir John Beauchamp, son of the great Earl of Warwick, commonly but mistakenly called the tomb of Duke Humphrey, stood on the south side of the nave. Another tomb, with a bust above and skeleton beneath, was that of John Colet, the famous Dean 1505-19, and the builder and endower of St. Paul's school. Another curious monument, and the only one which has survived the Great Fire uninjured, was that of John Donne, Dean 1621-31, preacher, poet, and wit, and friend of Izaak Walton; it is a statue in a niche representing the Dean standing with a closely clinging shroud around him, and his feet resting upon an urn. Other monuments, now lost, described and illustrated from old engravings, were those of Sir Philip Sidney, poet and courtier; William Herbert, Earl of Pembroke, 1569; Bishop Robert de Braybrooke, 1381-1405; Canon Ralph de Hengham; Sir William Cokain, 1626, with his wife and eleven children; and Sir Thomas Heneage, 1594. Below the choir was the beautiful church of St. Faith, its low vault supported by ranges of clustered pillars. Old St. Paul's was unusually rich in obits and chantries, which were a great source of wealth to the Cathedral; but abuses grew flagrant, and the revenues gradually fell off during the fourteenth and fifteenth centuries. The increasing desecration of the buildings until and after the Reformation was sketched by the lecturer.

During the second half of the sixteenth century, before and during Elizabeth's reign, no repairs of any kind, either outside or within, were made to the building, which gradually fell into a deplorable condition of dilapidation and degradation. At length James I., moved by urgent representations, appointed a Royal Commission to deal with the renovation, and appointed Inigo Jones as the architect. He rebuilt, in incongruous fashion, the west front—against which he erected a Corinthian portico—and also the end walls of the north and south transepts. Close upon £100,000 had been subscribed towards the repairs; but before the money had all been expended, the Civil War broke out, and St. Paul's again fell into troublous times. The money in hand, amounting probably to £50,000, was seized by Parliament; everything that could be converted into cash—even the scaffolding—was taken away. Inigo Jones's portico was let out as shops, the carved stalls were burned, and the nave soon became a home for Cromwell's cavalry. At the Restoration, the public services were recommenced; but only parts of the Cathedral were in a fit state for use. One Dr. Christopher Wren, a son of the Dean of Windsor, was called in to advise, and among other recommendations he suggested the removal of the old central tower and the erection of a spacious dome or rotunda in its place, so as to provide more space. After long discussion, the plan and estimates for the repair of the building were approved on August 27, 1666; but six days later the Great Fire broke out, and the edifice was involved in the general conflagration.

Some attempts were made at restoring the building, contrary to Wren's advice; but after eighteen months' tinkering the columns at the west end fell down, and the clergy, the King, the nobility, and Parliament were of one mind in deciding to sweep away entirely the old building and to erect a new Cathedral which should be worthy of the Metropolis and of England. There was equal unanimity in the choice of the architect. Wren was the most accomplished man of his day in all branches of science and art, and, in the lecturer's judgment, the greatest architect the country has produced. If after the clearance effected by the Great Fire, London had been rebuilt according to Wren's plan, we should have had broad and well-planned streets leading to a wide open space all around the Cathedral. Much to the advantage of St. Paul's, Wren superintended the new building from start to finish, between 1675 and 1710; but his surprising genius and abounding patience were taxed to the uttermost. He prepared many designs, but had to alter them again and again to please one and then another. His favourite design showed a cross with four equal arms, and the model of it which he prepared is still to be seen in one of the upper galleries of the Cathedral. Eventually, however, the form of the Latin cross was adopted. In 1675 the plans were generally approved, and a Royal warrant issued for the beginning of the work. Wren obtained the King's authority to make such alterations in the scheme as from time to time he should think proper, and he availed himself of that opportunity to an incredible extent, so that the building he constructed resembled but little the approved or Warrant design. We wondered at Wren's audacity; but it gave us what was, so far as the exterior is concerned, one of the grandest and most beautiful churches in Europe. Unfortunately, Wren was not allowed to carry out his designs for the interior, or we should have had something far more handsome than that we now saw. The Commissioners proved very incompetent persons, and they were constantly at loggerheads with the architect. The greatest insult that Wren received was when the Commissioners withheld half his salary until the building should be completed, the insinuation being that he was unnecessarily delaying the work that he might the longer continue his salary—only £200 a year as surveyor. The lecturer exhibited photographs from the account for February,

1686, showing a payment of £16 13s. 4d. to Wren for his month's salary; also payments to labourers, some of whom received 1s. 6d. and others 1s. 4d. a day, and to watchmen at the rate of 8d. a night. A further photograph, from the accounts of June, 1702, demonstrated that Wren's salary had been reduced to £8 6s. 8d. a month; but the labourers received the uniform rate of 1s. 6d. per day, and the watchmen's pay had gone up to 1s. a night—perhaps there had been a strike. Wren protested against the reduction of his salary; but it was not until he petitioned the House of Commons that he was successful, and it was agreed that so far as he was concerned the building was finished. The suspended moiety of his salary was paid to him at the end of 1711, when he was in his seventy-ninth year. He lived till he was nearly ninety-three, and once every twelve months he came to London to gaze upon St. Paul's. The lecturer described the measures taken by Wren to lay his foundations on the brick-earth, and remarked that a representative body of architects, engineers, builders, and scientists had recently reported that the vibrations felt—which were distinctly experienced during the passing of motor-buses while the author was photographing the documents in the library—were in no way injurious to the structure. At the same time, they reported that little or nothing had been done in the way of serious structural repairs since the building was erected, and recommended that all the stone- and lead-work should be repaired, and especially that the four great piers which support the dome should be strengthened. The Dean and Chapter are, therefore, appealing for £70,000, that being the minimum amount which will suffice to insure the safety of the fabric. Mr. Hall pointed out that the upper of the two Orders into which the exterior treatment of the masonry is divided was merely a screen to conceal the flying buttresses, and argued that, so far from being an unmitigated sham, it was a justifiable device to support the great thrusts of the dome—undoubtedly the most noble and magnificent feature of the edifice. A sectional view of the three domes was followed by actual photographs of the crown of the inner cupola, of the little gallery above it, of the conical wall of brickwork, of the timbers supporting the outer shell—each the result of several days' exposure of a plate, and making the method of construction clear even to the uninitiated layman's eye. A fine view of the interior of the space under the dome, looking to north-east across the area, was shown at this point. This illustration, from Mr. Hall's negative, was published in our issue of September 2, 1910 (p. 327, Vol. XCIX.). The lecturer proceeded to describe and show on the lantern screen Bodley and Garner's reredos, erected in 1887-8; the carvings in the choir, by Grinling Gibbons; Tijou's ironwork, Richmond's mosaics, the newly-decorated chapel of St. Michael and George, next the south western campanile, and many of the more important monuments. An inspection of the Geometrical Staircase, the Library, and the Whispering Gallery followed, and a visit was then paid to the crypt. In conclusion, Mr. Hall quoted Thomas Carlyle's appreciation of the Cathedral contained in a letter written to his brother in 1824: "I was hurrying along Cheapside into Newgate-street, among a thousand bustling figures and the innumerable jinglings and rollings and crashings of many-colour Labour, when all at once, on passing from the abode of John Gilpin, stunned by the tumult of his restless compeers, I looked up from the boiling through a small opening at the corner of the street. There stood St. Paul's, with its columns and friezes and its many wings of bleached yet unwarmed stone, with its statues and graves around it, with its solemn dome four hundred feet above me, and its golden ball and cross gleaming in the evening sun, piercing up into the heavens through the vapours of our earthly homes." It was silent as "Tadmor of the wild-rose," gigantic, beautiful, enduring; it seemed to frown with a rebuking pity on the vain scramble which it overlooked. At its feet were tombstones,

MUNSTER AND LEINSTER BANK. NEW HEAD OFFICES, CORK.—Messrs. ARTHUR and HENRY H. HILL, Architects.

above it was the everlasting sky; within, priests, perhaps, were chanting hymns; it seemed to transmit with a stern voice the sounds of Death, Judgment, and Eternity through all the frivolous and fluctuating city. I saw it oft, and from various points, and never without new admiration."

MUNSTER AND LEINSTER BANK, NEW HEAD OFFICE, CORK.

This work, which is now nearly completed, is a rebuilding upon the same site of premises of one of the leading banks in Ireland. The illustration shows the exterior of the building, which is carried out in hard white Irish limestone from Irish quarries, and worked in the yard of Messrs. John Sisk and Son, the general contractors. The architects are Messrs. Arthur and Henry H. Hill, of 22, George's-street, Cork.

At Edmonton, Alta., the excavation for the new Central Police-station, which is to be erected at a cost of \$25,000,000, has been completed. The structure is to be four stories high, 190ft. by 60ft., in dimensions, of stone construction. The architect is Mr. A. J. J. J., and the general contractors are the City Construction Department.

A new labour exchange is in course of erection in Lord Edward-street, Dublin, from plans by Mr. Andrew Robinson, M.V.O., of H.M. Office of Works, Dublin. It consists of a basement, first and second floor, has an area of 4,900 super feet, a frontage of 130ft. to the street, and a depth varying from 30ft. to 41ft. The front is of stone granite, with Portland stone cornice and balustrade. Messrs. Collier Bros. of East Wall, Dublin, are the builders.

The remains of an earthenware urn, believed to be the largest Early British vessel yet discovered in Lincolnshire, has been dug up on the Canwick sewage farm of the Lincoln Corporation. Among the fragments were found a few burnt bones, which appear to be human. The urn is about 16in. high, and is decorated along the rim with four lines of herringbone markings. It is ascribed to the period 1000-500 B.C. The remains are being reconstructed by Mr. A. Smith, curator of the Lincoln Museum.

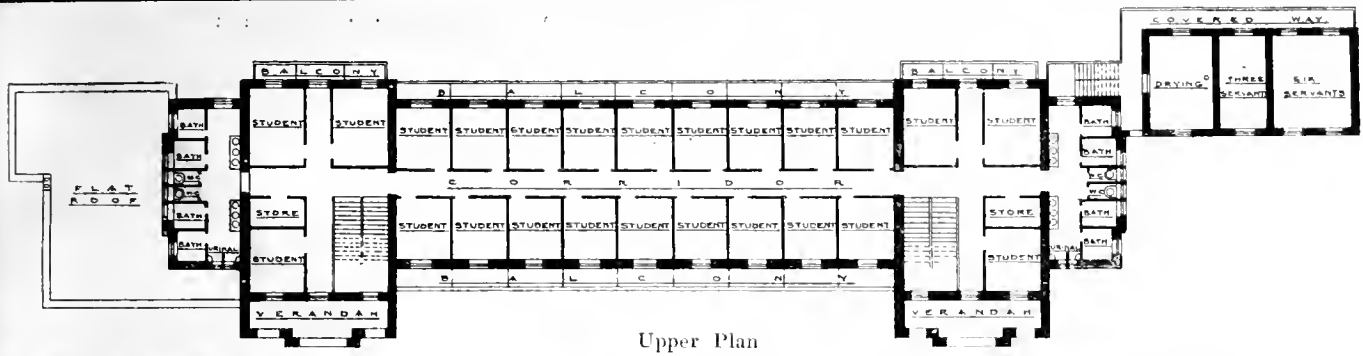

STUDENTS' HOSTELS, HONG KONG UNIVERSITY, CHINA.

These blocks of buildings provide for the housing of the Chinese students at the Hong Kong University, which has recently been completed. They are designed to

accommodate about fifty students in each block, and are built upon terraces cut out of the hill-side upon the north side of the island overlooking the harbour of Hong Kong and the hills of the main land of China. One block has been finished and two

BLOCK PLAN OF SITE OF STUDENTS' HOSTELS, HONG KONG UNIVERSITY.

Upper Plan

STUDENTS' HOSTELS, HONG KONG UNIVERSITY, CHINA.— Messrs. DENISON, RAM, and GIBBS, Architects.

Ground Floor Plan.

are approaching completion. The walls are of brickwork with Amoy brick facings; floors throughout of reinforced concrete; and mouldings, etc., of artificial stone locally made. The buildings are being erected by Chinese contractors from the designs and under the supervision of Messrs. Denison, Ram, and Gibbs, architect and civil engineers, of Hong Kong.

CHIPS.

A public hall has been built at Ardahan, Co. Galway, at the sole cost of Mr. Edward Martyn, of Tullyra Castle. It is faced with limestone, and measures 78ft. by 34ft., and 30ft. in height. Mr. William Scott, A.R.H.A., is the architect, and Mr. William Emerson, of Dominick-street, Galway, the contractor.

A sewage scheme is about to be carried out for the parish of Bulkington, Warwickshire, at a cost of £8,500. The present sanitary arrangements are of a primitive character, and the Local Government Board, who recently sent down an inspector to the district, have called upon the council to carry out an up-to-date scheme.

The Primitive Methodist church at Bishop's Castle was reopened on Sunday after renovating and decorating. The architect of the church, the late Mr. J. Harris Pickard, of Whitechurch, Salep, prepared the specifications for the improvements, which have been carried out by a local contractor, Mr. W. S. Gwilt.

A new Association of Architects of Manitoba was formed recently, and a council of nine members was appointed for one, two and three-year periods. Mr. H. E. Mitchell was elected president, Colonel Mitchell, vice-president, and Mr. R. G. Hanford, secretary. The old association has been incorporated with the Manitoba Board of Examiners of Architects under an Act passed by the Provincial Legislature last session.

Leaks in a concrete pressure-conduit 1885ft. in length and 7ft. in diameter, which led from the basin to the pumping-station at the Bissels Point water-intake in St. Louis, were comparatively few, according to the annual report of the Water Commissioner. All concrete used for repairs is of gravel with cement and sand in such proportions that one sack of cement produces 4½ cubic feet of concrete; 12lb. of hydrated lime are added to each sack of cement, and the mixture is retained in a batch-mixer for three minutes.

A contract has been signed for the construction of the Central Essex Railway. The Essex County Council has stipulated that £15,000 shall be set aside for the construction of bridges to meet the heavy motor traffic.

The death took place on Friday of the Rev. Charles Edward Laing, vicar of Bardney, Lincolnshire. Mr. Laing was a prime mover in the excavation of Bardney Abbey, a Benedictine house, in his park, founded in 697 by King Ethelred and Queen Osthryl. It was rebuilt by the Normans. Through Mr. Laing's efforts the ground plan was laid bare. This shows the bases of Norman and Early English pillars, and many memorial slabs of the workmanship.

The Board of Trade have recently confirmed the following Orders made by the Light Railway Commissioners: North Devon and Cornwall Junction Light Railway Order, 1914, authorising the construction of a light railway in the County of Devon from Torrington to Halwill, including the reconstruction of part of the mineral line known as the Torrington and Marland Railway; and the Swansea Corporation Light Railways (Extensions) Order, 1914, authorising the construction by the mayor, aldermen, and burgesses of the borough of Swansea of further light railways in that borough.

EGYPTIAN TRADE IN BUILDING MATERIALS.

According to an article in the August issue of the *Journal* of the British Chamber of Commerce of Egypt, the value of the imports of building material into Egypt during 1913, was £E.2,311,885, of which the United Kingdom supplied goods to the value of £E.343,071.

The following table shows the value of the imports into Egypt during 1913 of some of the principal items of building material, the figures for 1912 being added for purposes of comparison:—

	1912.		1913.	
	Total Imports.	Share of United Kingdom.	Total Imports.	Share of United Kingdom.
	£ E.	£ E.	£ E.	£ E.
Timber	1,045,745	40	1,357,980	9,122
Bricks, ordinary, and fire-bricks ..	34,865	29,870	14,971	11,179
Tiles	4,133	833	5,544	21
Earthenware pipes ..	10,595	10,025	11,424	11,339
Worked building stone	10,054	51	16,382	4,631
Lime	40,795	—	44,995	—
Cement	168,210	53,683	107,869	31,458
Sanitary articles, earthenware and cementware ..	26,805	13,888	32,186	16,724
Window glass ..	31,155	6,125	39,709	6,401
Paints	63,211	31,005	59,661	22,366
Varnish	13,747	7,790	11,672	6,072
Cast iron	6,319	6,319	7,348	6,599
Cast-iron pipes ..	54,764	30,457	57,393	35,466
Wrought-iron and steel pipes ..	123,377	69,350	158,114	86,015
Rolled steel joists ..	106,193	11,966	101,990	13,474
Sheet iron, including corrugated ..	82,065	29,658	89,196	22,643
Locks, window fittings, &c. ..	124,821	18,506	110,925	28,503
Lead pipes ..	10,052	693	7,503	26

Joinery.—The United Kingdom supplies worked timber to a limited extent in the form of office furniture and high-class joinery, and it should be noted that there is a certain demand for good joinery—although, generally speaking, cheapness, not quality, is the principal recommendation to buyers in the building trade in Egypt—and a not insignificant trade might be done by English master joiners in good work, of well seasoned timber, at reasonable prices.

Lead Pipes.—During 1913 lead pipes to the value of £E.7,503 were imported, of which the United Kingdom supplied goods to the value of only £E.26. The principal suppliers were France £E.4,326, Algeria £E.1,497, and Germany £E.1,053.

Iron and Steel Pipes.—British wrought iron and steel pipes are acknowledged to be superior to any other, chiefly on account of the accurate threading of the ends, which always fit when jointed, and British makers will not depart from this accuracy for the sake of cheapness. During the year 1913 the United Kingdom supplied wrought-iron and steel pipes to the value of £86,015, Germany £E.52,271, United States of America £E.10,143, Holland £E.5,636, and Belgium £E.2,949. The demand for pipes for artesian wells has been extremely heavy since the latter part of 1913 (see *Board of Trade Journal* of May 7 last, p. 306).

Earthenware Pipes. The British manufacturer of earthenware pipes is supreme. A large increase in the demand should be looked for during the next few years until the new drainage scheme in Cairo is completed. Sewage disposal works, on a considerable scale, are also being carried out in Port Said, and important extensions in the drainage system of Alexandria are contemplated in the near future. Many of the more important towns in the interior will also probably undertake similar work as soon as funds permit.

Tiles.—The share of the United Kingdom in the imports of tiles is practically negligible, only amounting to £E.21 in 1913 nearly all the rest coming from France, to the value of £E.5,544. This is explained by the word "Marseilles," where corrugated

and many kinds of roofing tiles are made on the seaboard and shipped direct. As the United Kingdom succeeds in selling earthenware pipes, it is difficult to understand her inability to obtain a share in the trade of earthenware tiles.

Cement.—Portland cement of United Kingdom origin is being ousted in Egypt by brands of "Portland" cement made elsewhere, and the reason given is that the genuine British brands cannot be obtained because British manufacturers are too full of orders for other parts of the world to cater for the smaller Egyptian orders. This reason can hardly be accepted, and is probably offered by contractors as an excuse for supplying cheaper imitation Portland cement.

Belgium secures the bulk of the Egyptian trade in cement, although British cement holds its own as regards quality, and the falling-off in trade must be ascribed to the higher prices demanded by home manufacturers. Taking as a basis the quantities and values of cement imported from various countries during the year 1913, as given in the Customs statistics, the difference in prices would seem to be considerable, the average value per ton of British cement delivered in Alexandria being £E.2.291, followed by French at £E.1.828, Italian at £E.1.714, Belgian at £E.1.707, German at £E.1.653, and Austrian at £E.1.621. Austrian cement therefore works out at nearly 14s. per ton cheaper than British.

Steel-Joists.—Belgium heads the list of exporters of steel-joists to Egypt, followed by the United Kingdom. The appended table gives the figures for the imports from the various countries supplying Egypt with this description of building material during the years 1911, 1912, and 1913.

	1911.	1912.	1913.
	£ E.	£ E.	£ E.
United Kingdom	8,608	11,966	13,974
Belgium	77,208	89,794	84,718
Germany	7,137	4,433	1,432
United States	—	—	1,846
Total imports	92,953	106,193	101,990

Generally speaking, British steel for building purposes cannot be obtained in Egypt unless it is imported for special work; Belgian makes, on the other hand, are stocked. Certain non-British manufacturers state in their catalogues that, if requested, they will roll steel-joists to the British and American standard specifications, a sufficient proof that their ordinary standard of rolling is inferior to the British standard. Some of the Continental joists bear the standard mark "P.N." (profile normale), whereas in reality they are as much as 5 per cent. under the standard weight. This is taken advantage of by unscrupulous architects to the detriment of their clients. If, as in the case of the Belgian manufacturers mentioned above, British makers of steel joists offered greater facilities to their buyers or agents to hold stocks, it is probable that a greater share of Egypt's trade in this line might be obtained.

Ironmongery, Locks, Bolts, Etc.—There is much room for improvement of United Kingdom trade in shutter and window bolts of the "espagnolette" type. Scarcely an English bolt of this description can be seen. Notwithstanding the fact that the general demand is for the cheapest, and often the flimsiest, quality of hardware, United Kingdom ironmongery, which is always of a good class, should be more in evidence, there being a fair amount of building done for which good-quality fittings are specified.

Stoves.—The English stove, which is recognised to be of good quality, is not much in evidence. With all the facilities for manufacture in England and Scotland, this state of affairs seems to point to lack of enterprise and study of the local demand on the part of home manufacturers. The stove mostly in use is of the light type, not too light, with some white enamel front work. There is also a limited, but increasing, demand for firegrates.

In conclusion, it is suggested that in order to overcome the difficulty of obtaining British articles of hardware, more especially steel goods, for the building trade in Egypt, a

group of British non-competitive manufacturers of the various classes of building material should combine in forming a large depot at Alexandria; not a small office, but a warehouse, where articles in general demand for the building trade might be stocked, and samples of other articles be placed on view, and where transactions could be made and orders sent home. United Kingdom manufacturers, if they wish to obtain a fair share of Egypt's trade in building materials, should grant their agents as extensive facilities as possible, both as regards credit and by allowing them to maintain a fair stock, in order that they may be in a position to compete successfully with their foreign rivals. A careful study of the articles in demand in the Egyptian market which are at present supplied by other countries might lead to remunerative business.

COMPETITIONS.

BATLEY.—The local limited competition now being held in this borough for new council schools at Healey-lane (to be erected on a field site, next the cricket-club pitch, at a cost of £3,000, exclusive of furniture), is about to be settled. The drawings went in on the 1st of the month, and only three designs have been submitted. Architects in practice in the town of Batley were alone eligible to compete, and to tender really, because each architect had to state upon what inclusive terms he would be prepared to do the job and carry out the work, including quantities as well as for furnishing any incidental and necessary plans for all and various authorities, no extra remuneration whatever being contemplated. The committee, moreover, is left free to reject or not to accept either of the designs, and no premiums were offered; indeed, it was stipulated in the Conditions that no prize of this sort or other sum whatsoever would be payable for any of the designs. The school had to be of the pavilion type, following as closely as possible in order of preference A, the school at New Earswick; and B, the school at Bullershaw, Bradford. The layout should be T shaped, and must consist of six classrooms for forty scholars, each on the dual-desk arrangement. A central hall, available likewise as a gymnasium. Two teachers' rooms to be provided with cloak-rooms, lavatories, caretaker's stores, out-buildings, play-sheds, also boundary walls and fence to enclose the playgrounds. No motto or designating mark could be used, and no perspectives were allowed.

The partnership hitherto subsisting between J. Ormrod and E. J. Pomeroy, under the style of Ormrod and Pomeroy, at Acresfield, Bolton, in the county of Lancaster, in the profession or business of architects and surveyors, has been dissolved.

A start has been made on the office building which is to be erected at the corner of Adelaide and Toronto-streets, Toronto, by the Excelsior Life Association, at a cost of 500,000dol. The structure will be eleven stories high, of steel, terracotta, and brick construction. The architect is Mr. E. J. Lennox, Bay-street, Toronto, and the general contractors are the P. Lyall Construction Company.

The Bangor City Council some time ago ordered the demolition of a number of houses in Kyffin-square, which the medical officer had condemned as unfit for human habitation. The owners appealed, and the Local Government Board held an inquiry. The board have now reported to the Bangor Council that, after careful consideration, it has been decided that the demolition orders must be carried out, the cost of the appeal to be paid by the protesting owners.

At a special meeting of the Buckie Town Council, held on Friday night, it was agreed to give the contractors, Messrs. Charles Brand and Son, Glasgow, instructions to close the inner basin of the Cluny Harbour by cofferdam, to enable the excavation of the basin and the construction of the entrance of the new harbour to be made while the war was paralysing the herring fishing. The town council hoped the contractors would be able to reopen the harbour after a period of five months.

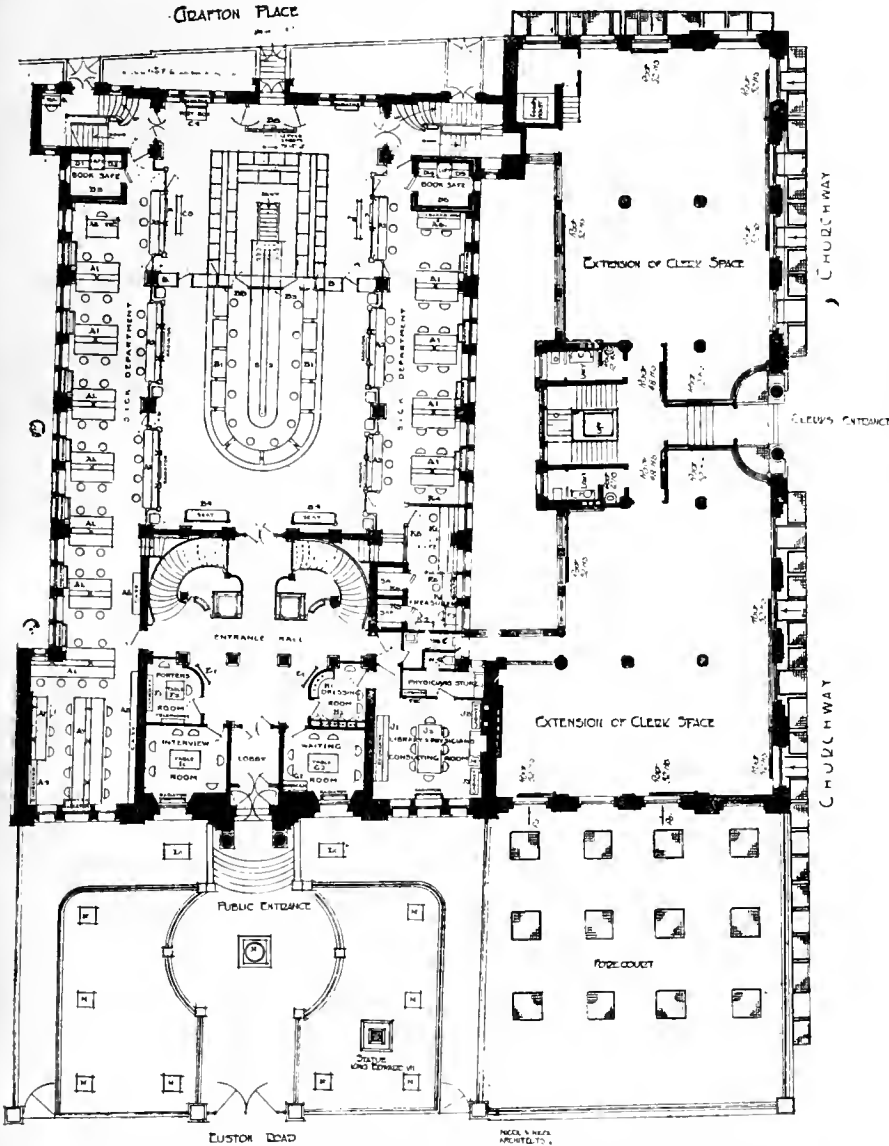

Our Illustrations.

HEARTS OF OAK BENEFIT SOCIETY'S BUILDINGS EXTENSION, EUSTON ROAD, LONDON.

The competition design chosen for this building was illustrated by us on August 23, 1902, and some other drawings were published on the occasion of the opening of the first section of this society's house by the late King

that building operations will shortly be started. The problem which the architects had to solve was how to group a new west wing, added to the central block already built and designed, to be flanked by two wings and still to keep up the dignity and continuity of the central feature. The illustration in perspective and the plan given today show how this has been done. The leading features of the façade have not only been continued along the Euston-road, but an equally imposing elevation has been ex-

Pembroke Works, Kilburn-lane, N.W. A special retaining wall and shoring had to be used to support the ground at the Euston-road end. The old building was underbuilt early in the spring, and as the works are now being advanced, it is confidently expected that the extensions will be ready for occupation at the end of next year. The architects are Messrs. Nicol and Nicol, of King's-court, Birmingham, and the quantity surveying is in the hands of Mr. C. W. Brooks, of Vernon House, Bloomsbury-square, W.C.

THE "HEARTS OF OAK" BUILDING EXTENSION, EUSTON ROAD, LONDON.
Messrs. NICOL and NICOL, A.A.R.I.B.A., Architects.

Edward, accompanied by Queen Alexandra, when the business of the society was removed from the Delegation Hall committee rooms and offices in the old buildings in Charlotte-street, Fitzroy-square, where for many years the official work, both for London and the provinces, was conducted. The site acquired has since been isolated on a third side by the formation of a new street called Churchway, from Euston-road to Grafton-place, partly on the site of a narrow lane adjoining the Women's Hospital, which was also called Churchway. The original design of the architects was a central block extending across the site with two wings forming a symmetrical elevation of the Euston-road. The west wing was to extend to the present London County Council Fire Brigade Station at the corner of Euston-square, and the east wing to the new roadway now constructed with a return elevation. The needs of this important fire brigade station led to negotiations for and purchase of the site of the west wing for an extension of this station, and we understand

tended along the Churchway frontage on the west. The main entrance from Euston-road has been supplemented by another correspondingly important entrance in the centre of the western façade. The new wing, consisting of eight stories in height, will be almost entirely occupied by the clerical staff in the sick benefit and industrial insurance departments. The two bottom stories will be used as filing departments and stores, extending under the forecourt to Euston road and under the footpaths in the Churchway. Messrs. Foster and Dicksee, of Rugby, are the general contractors for the work, including the Portland stone superstructure. The plan given is typical of the other floors, and shows that the large mixed staff now engaged will be principally accommodated in large open spaces, one or more floors representing a department. Considerable delay has been occasioned by the London building operatives, who were locked out for several months, the site being abandoned immediately after the general excavation was finished by Messrs. G. Godson and Sons, of

INTERIOR OF ST. MICHAEL'S CHURCH, GOLDSMITH'S GREEN.

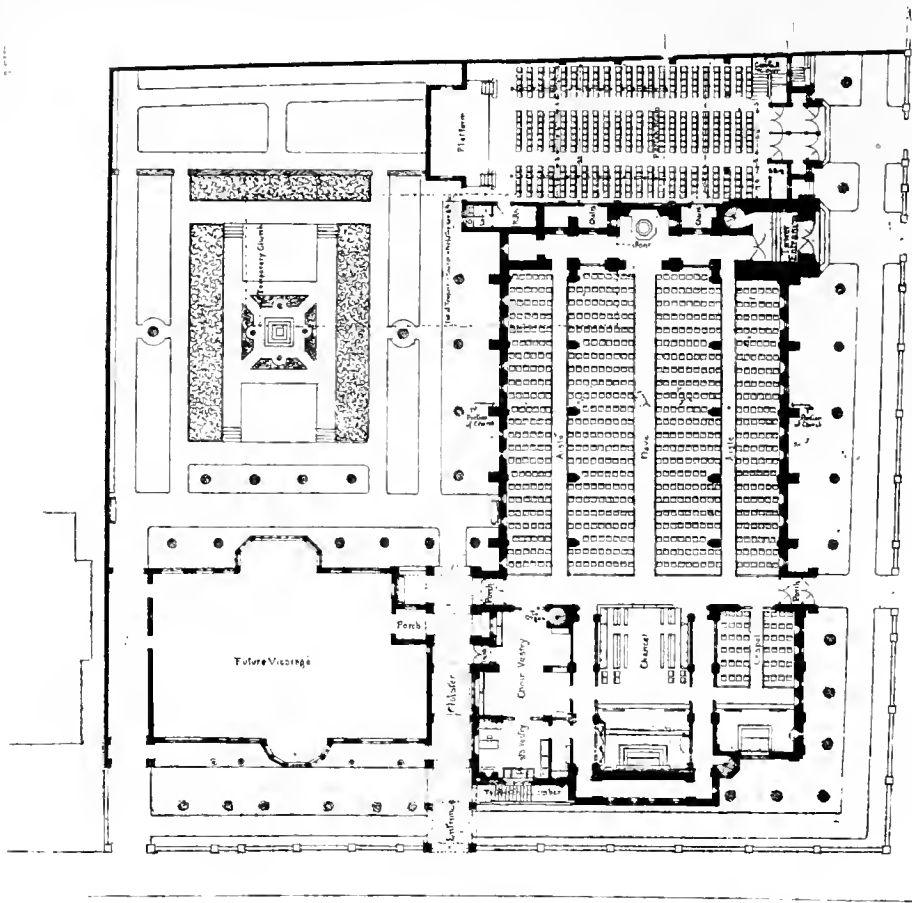

The church consists of a nave, with north and south aisles, a baptistry with tower and south-west porch, and a chancel with ambulatory and vestries on the south, and a chapel on the north. The ambulatory, which is carried up on each side of the chancel and over a part of the choir vestry to form an organ-chamber, with space for augmented choir, is approached by a turret from each side of the chancel. The total length of the church is 138ft. by 62ft. wide. Dignity of effect in the interior is provided by carrying up the enclosing arches of the clerestory from the nave floor to the roof, which is 35ft. 6in. to the springing and 42ft. to the apex. Arches are also provided across the entire length of the nave. Height is provided in the chancel by carrying up the ambulatory as a double arcade and providing a proportion equal to more than double its span. The interior includes a reredos which by its subjects illustrates the "Te Deum." The east window, 23ft. from the floor, in continuation of this idea, has in the centre light our Lord enthroned, seated on a rainbow, His feet resting on the earth, from which flow the four rivers of Paradise, with the subject above illustrating "To Thee all angels cry aloud"; "To Thee Cherubim and Seraphim continually do cry, Holy, Holy, Holy, Lord God of Sabaoth." Groups of figures, as follows, complete the window: At left top, "The goodly fellowship of the Prophets"; at right top, "The glorious company of the Apostles"; at left base, "The Holy Church throughout all the world"; at right base, "The noble army of Martyrs." The reredos, 21ft. 6in. by 20ft. wide, contains the following: In the centre St. Michael, in the right hand a sword, with the scales in the left with which he is weighing the good and bad souls. Beneath, the Recording Angel with open book on knees, on either side an angel blowing the last trump. Screens are proposed between the chancel and ambulatory, between the chapel and ambulatory, and from the chapel and vestries into the aisles as well as the baptistry at the west end. The chapel is to have a reredos 16ft. 6in. high by 8ft. 6in. wide, the centre compartment having the figure of a "Salvator Mundi," robed as King and Priest, with an angel on each side robed as a deacon and holding chaplets of olives and boughs of laurels, the three figures being supported on brackets with canopies over. It is hoped to have a pulpit with canopy over, an important feature being required on the north side of the nave as a counterfoil or balance to an overhanging organ on the south side where the lectern stands. The lower part of the pulpit is to include canopied figures representing with the reredos and lectern the seven angels which stand in the presence of God, viz., St. Michael, with the scales, in the reredos; St. Gabriel, in lectern, with lily; and in the pulpit St. Raphael, with pilgrim's staff; St. Uriel, with roll and book; St. Chamael, with cup and staff; St.aphael, with flaming sword; St. Zadkiel, with sacrificial knife. At the base of the chancel roof will be pictured the Hierarchy of Heaven. The lectern will be composed of the figure of St. Gabriel supporting the book bound bearing the sacred monogram with "Colum et terra transibunt," etc.; another, the Alpha and Omega with "In principio erat verbum," etc.; and the third, a St. Andrew's Cross with "Sicut verbum quod egredietur"; and at the base of the chancel roof the Hierarchy of Heaven. A Rood Beam is provided in the chancel arch, with the three figures and

emblems of the Passion beneath. Spaces are left in some of the windows for the subjects of "The Ascension," "Our Lord's Baptism," "The Transfiguration," "Our Lord's Final Victory," "The Church Militant," etc. The altar ornaments with reredos to be gilded and burnished. It is also hoped to provide in the cornices of both roofs shields with the emblems of the cardinal and theological virtues, the fruits of the Holy Ghost, and other emblems. The Litany desk is to have a

CLUMBER HOUSE, WORKSOP.

The greater part of the mansion was burnt down about forty years ago, when the south and east fronts were rebuilt by Chas. Barry. The west front was never finished. Our illustration shows this front completed by the addition of a porte-cochère, with entrance-hall and cloakrooms, etc., on the ground floor, and the addition of dressing-rooms and bathrooms to the Lincoln and Prince of Wales suites on the first floor. The eleva-

Baker that, in view of the fact that the price to be paid by the corporation for the property at Tuns-gate had now been settled by agreement, the amount of the deposit paid by the council should be increased to £350, being the amount of the usual percentage. It was resolved: That the recommendations of the sub-committee be approved and adopted, and that application be made to the Local Government Board for sanction to a loan of £9,000 to provide for the purchase of the property and the provision of offices, including cost of building architect's fees, legal costs, etc. Alderman Ellis, chairman of the committee, in moving the adoption of the first paragraph of the committee's report, said he thought the council would agree with him that the plans they saw that night formed altogether a very good exhibition of local talent. He thought that on all grounds—planning and elevation—design No. 2 was by far the best in every respect, and he felt that if they accepted his recommendation—which the committee unanimously endorsed—they would have as their municipal offices a convenient building and an edifice which would be fit to take its place by the side of the other public buildings of the town. The chief merit of that plan was the clever way in which the architect had adapted it to the gradient of the site. He had formed a sort of lower ground-floor and an upper ground-floor, making use of the slope of the land. The lower ground-floor would be occupied by the sanitary department, stores, and so on; and the upper ground-floor for the town clerk's offices. Another good feature of the plan was the very excellent way in which the corridors were lighted, and also the excellent drawing office which had been provided—a large room with a good north light, which was so essential. The front elevation was good, and the back elevation was also satisfactory. Of course, there were some drawbacks. They felt it was rather unfortunate that the main entrance of the building was to be at the south-east end. No doubt the architect would say that in the future some extensions would be necessary, and then possibly the entrance might be in the middle, though he (Alderman Ellis) was not sure of that. The other drawback was in the planning of the strong-room, which occupied a position on the outside wall and close to the heating chamber; but that, they thought, might be got over. In addition to the main entrance at the south-east end, there was also an entrance at the north-east end, and probably in practice that would be most largely used by the public, as it really gave access to the whole of the floors. The estimated cost of the building was £4,266. The assessor did not think it would be built for less. When they asked him whether it was likely to cost much more, he said, "I do not see any reason why it should cost more." The sub-committee and the Finance Committee were both unanimously in favour of adopting the report of the assessor, and he moved that. Colonel Lane seconded. The motion was unanimously agreed to without any discussion. The town clerk then opened the envelope marked No. 2, and announced that the author of the design was Mr. T. R. Clemence, 53, High-street, Guildford. Alderman Ellis said he was sure they all congratulated Mr. Clemence, and thanked those not successful for the very thorough way in which they had done the work. He thought all the plans reflected great credit on the gentlemen who sent them, and justified in the very fullest way the selection of the council made. On the motion of Alderman Ellis, the two other recommendations were also unanimously agreed to. Alderman Ellis remarking that he hoped it would not be necessary to spend the whole of the £9,000.

CHURCH OF ST. MICHAEL, GOLDS' GREEN, LONDON, N.
Mr. JOHN T. LEE, Architect.

representation of the Mercy Seat with the Ark and staves, surmounted by the two cherubim, their faces looking downward to the Mercy Seat and their wings covering it, with the Name of God in Hebrew surrounded by rays of glory, the whole enclosed in a border in which the words "Kyrie Eleison," "Christe Eleison," "Kyrie Eleison" are carved. The church was consecrated early this year. The builders were Messrs. Jos. Dorey and Company, Limited, Brentford, Middlesex, and Mr. John T. Lee, of 36, Tytherton-road, Tufnell-park, London, was the architect. The drawing was shown at the Royal Academy Exhibition.

REREDOS: ST. BARNABAS' CHURCH, TUNBRIDGE WELLS.

This reredos consists of a large painted panel of the Crucifixion, surrounded by smaller panels, in which are painted figures of saints. These are divided by shafts and buttresses, with tracery heads, and surrounded with a vine leaf running pattern, with shields at the angles. A large tester, with cresting and panelled soffits, completes the design. The whole is constructed of oak, which will be painted and gilded. The figures have been painted by Mr. T. Alham, of Great Portland-street, and the oak work has been carried out by Messrs. Bridgman and Son, of Lichfield. The architect is Mr. Percy M. Andrews, A.R.I.B.A., of Acton, W. The drawing which we reproduce was exhibited at the Royal Academy this summer.

tions are in stone, and were designed to harmonise with the old work. The contractors were Messrs. G. Trollope and Sons and Colls and Sons. The architect is Mr. Clyde Young, 6, Lancaster-place, Strand, W.C., and this drawing was exhibited at the Royal Academy.

NEW MUNICIPAL OFFICES, GUILDFORD.

(SELECTED DESIGN.)

At the meeting of the Guildford Town Council on Tuesday week, the sub-committee of the Finance Committee made their report on the plans submitted by the three architects selected—Mr. E. Lunn, Mr. T. R. Clemence, and Mr. F. J. Hodgson—for the new municipal offices to be erected in the Tuns-gate. The plans were displayed in the Council Chamber. The Municipal Offices sub-committee reported that Mr. J. H. Norris, the assessor appointed to advise upon the plans submitted for the proposed municipal offices at Tuns-gate, attended their meeting and submitted his report. After careful consideration of the plans submitted by the competitors, the sub-committee unanimously approved the selection made by the assessor, and recommended its adoption by the committee, the approval of the sub-committee to be subject to alteration of the selected plan on some points of details as may be decided hereafter. The sub-committee further recommended that the council accede to an application made by Mr. F. J.

The Calgary University contract has been awarded to Messrs. Archibald and Co., Winnipeg. The estimated cost of the building is 100,000dol.

The late Mr. John Chew, of Blackpool, consulting gas engineer to the Blackpool Corporation, left estate of the gross value of £24,039 of which the net personalty has been sworn a £19,105

Corrente Calamo.

We hope readers and advertisers will get the Parliamentary paper Cd. 7595 for themselves, and not be contented with the extracts in the daily Press. It was issued just too late for us to comment on it last week. It contains reports from the British Embassy in Berlin "respecting the official organisation there for influencing the Press of other countries." Early this year a meeting, of which the secret has been well kept, was convened in the Ministry of Foreign Affairs, of which Dr. Hamann, the notorious head of the Press Bureau of the German Foreign Office, was the originator, and at which the Foreign Secretary himself was present. The meeting was attended by members of the leading industrial concerns of Germany—the North-German Lloyd, the Hamburg-America Company, the Deutsche Bank, the Disconto Gesellschaft, the Allgemeine Electricitätsgesellschaft, Siemens and Halske, the Schuekert Works, Krupp, the Cruson Works, etc. They formed a private company with the purpose of "furthering the German industrial prestige abroad"—a conveniently vague purpose. The company was financed by private subscriptions and by a Government grant. The sum at first suggested as a necessary revenue from private subscription was £12,500; but the company present at the first meeting was so enthusiastic that it definitely promised annual subscriptions amounting to £25,000. The Government promised £12,500 per annum—the whole Secret Service Fund, in fact, at the disposal of the Imperial Foreign Office for similar purposes (e.g., for the payment of subsidies to certain papers abroad). The company entered into an agreement with the "Agence Havas" that the latter would in future only publish news concerning Germany if supplied through "Wolf's Telegraphen-Bureau." The latter was to receive its German news exclusively from the new company. The company, so it was stated, intended to make a similar arrangement with Reuter's Telegraphie Bureau for those foreign countries in which Reuter controls telegraphic communications. If Reuter declined, the "Deutsche Kabelgesellschaft," a smaller German news agency supplying telegrams from certain countries (e.g., Mexico) and working in agreement with Wolf's Telegraphie Bureau, was to be financed by the new company to run a service in competition to Reuter's.

All the concerns agreed to "pool" their usual expenditure on advertisements in the foreign Press, a sum believed to be not less than £25,000 a year. The new company was to issue advertisements only to those foreign papers which published "German information" supplied to them by the German company. The foreign Press was to be "watched" by the company's agents, who were to be "journalists" specially despatched for the purpose. In the course of April and May the British Embassy reported a new system of "week-end telegrams" to the United States, Canada, South America, India, and most of the British Dominions. In June the "Deutsche Export Revue" betrayed the organisation of the scheme. The British Ambassador reported that high official quarters had given instructions that this article should not be reproduced or referred to, "as its inadvertent publication

was considered extremely inopportune and embarrassing." The article contained the names of the administrators and many other details, and concluded with the following paragraph, which, as Sir Edward Goschen remarks, is "of a certain refreshing ingenuousness": "The intended despatch of journalists, we believe, however, in any case to be a mistake, as it would certainly soon become common talk in the editorial offices in the several places abroad that they represent a syndicate officially supported by the German Empire. *If such things are intended, it would be better to fall back upon gentlemen who are already in touch with the respective editorial offices, and who could serve German interests without attracting so much attention as would journalists sent out for the purpose.*"

As a matter of fact the tactics referred to in the foregoing paragraph are of much older date than that mentioned. Our own readers must know it as well as we do. For several years past journals whose only other claims to attention have been their blatant proclamations of superiority to British contemporaries, have been busy trumpeting the claims of German methods and German materials, and have taken their wages in German advertisements which the rest of us have declined, or have inserted in ignorance of their real origin. "Gentlemen in touch with the respective editorial offices" have been subsidised and feted and testimonialised—not only they. If ratepayers are curious to know why German tenders and German "British" firms have been preferred to native ones in constructional and electrical work, let them ask those responsible to their respective authorities. Let readers and advertisers, when searching the register at Somerset House, as we have done, dig out some of the facts about certain "British" organs, as well as those concerning the "British" firms they have puffed and advertised for some years past, and, unless their memories are very short, they will give them a very wide berth in the future.

Mr. Lloyd George as yet is the only Minister who seems inclined to damp down the energies of local authorities, which the other Government departments are most properly encouraging. Replying to a deputation of the Municipal Corporations Association on Tuesday, he agreed that the money required by municipalities for carrying out works to relieve distress should be advanced out of the Government war loan at the same interest as the Government paid. "I am speaking as the Treasury," he continued. "The Local Government Board have their business of seeing that you go on spending. Our business is to see that you do not spend too much. Therefore, if you do not mind my putting this to you—purely speaking as the Treasury—we will find the money for you if there is any distress, but we do not want to find any money for you unless there is really actual insistent distress in the districts. It is very much better that you should get the people to work in the things that are normal if you can. Our trade is not going. The seas are ours, and they will remain ours. We shall get not merely our own trade, except that of European countries, but we shall get a good deal of the enemy's trade as well, and, of course, there is always the business which is necessary in order to keep the war going. So that there will be a great deal of

employment in the ordinary course of business, but there will be some districts that will be very hard hit. I do not want municipalities in districts which are not hard hit to spend money, because we want that money for fighting." We disagree entirely. We want money for fighting, of course, and shall get it; but "that money" which the municipalities are asking for is a comparatively trifling sum, and is asked for to keep home industries going remuneratively, and so make up for our temporary loss of foreign trade.

The pleasantly situated and picturesque villages of Termonde and Dinant, and, we fear, many another Belgian town, must be added to Louvain and Malines as monuments of the senseless barbarity and vulgar destructiveness of the German people and their drunken soldiers. Termonde, on the Dender, is best known to tourists as a junction; but it is the Dendermonde so often alluded to by Uncle Toby in his narrative of the siege of 1706, when it was surrendered to the English. The Late 14th-Century church of Notre Dame, now said to be destroyed, is familiar to architectural students on account of its quaint octagonal tower and its 12th-century square font of Tournai marble, of the type of those in Winchester and Lincoln cathedrals, and the churches of Meon and St. Peter, Ipswich. Every visitor to Belgium returns with pleasant memories of Dinant, so picturesquely situated under the limestone cliffs of the Mense, opposite St. Medard. The recently restored church is—or, rather, was—a cruciform edifice, with bulbous steeple, chiefly work of the 13th century, but containing archaic doorways dating back to the 10th or 11th century. The little hotel de ville near by was of considerable interest. A sketch of the town and the fortifications above, taken from across the iron bridge, appeared in our issue of August 21, 1891, on the occasion of the visit of the Society of Architects to Belgium and their reception by the late King Leopold.

Builders and bankruptcy have of late years been too closely connected. We are, therefore, very glad to note a large decrease in the number of failures during last year, as compared with the year before. Thus the return just issued for the period ending December 31, 1913, gives 160 builders as bankrupts, which is a good decline from the 201 of 1912. During the same period the figures for decorators, etc., fell from 72 to 60, while auctioneers and house-agents showed a still better result by declining from 40 in 1912 to 24 last year. This makes it seem as if there had really been more business doing, though some say, cynically, that it simply means there were no more left to fail! In the same way these official figures show that while in 1912, 24 architects and surveyors became bankrupt, only 13 had to go through the Court in 1913. This cannot surely be because that was all that was left of them, and so it must be a sign that more business was doing and more money made, which is certainly a preferable supposition. Again, builders' merchants show a decline from nine cases in 1912 to only three during last year, and this may be taken as a crumb of consolation and some sign of improving business. But as to what will happen during the present year of the Great War no man can say.

There is good news of the capture of one industry that was in great measure becoming

German—the glass trade. One London manufacturer is busy producing glass tubing for use in medical and other Government service. Another branch of the trade which English makers are trying to seize is that in the fine glass vessels used in chemical laboratories and for scientific purposes generally. There seems to be no reason, also, why the commoner glass used for windows should not be produced in this country almost entirely. There has also been severe Continental competition in table glass, large quantities of the cheap machine-made glass being imported, and the glass bulbs used for electric lighting are largely of foreign make. One difficulty in the making of certain kinds of glass is said to be that the potash used in the process is almost entirely a German speciality. We notice it is suggested that the revival of the kelp industry might provide employment in the West Highlands. Its failure has been mainly due to the importation of potash salts from Germany.

CHIPS.

Mr. Edward Sbarman, of Croyland Abbey, Wellingborough, head of the firm of Sbarman and Archer, architects, of Wellingborough, who died on July 28, aged eighty-five, left £16,208 gross.

The Havant Urban District Council have resolved to pay their surveyor, Mr. A. E. Stallard, an honorarium of £50 for his services as engineer to the Spring Lawn extension of the drainage scheme.

The new electric-tramway line constructed by the Liverpool Corporation from Edge-lane to Bowring Park, Roby, has been inspected by Colonel von Donop on behalf of the Board of Trade, and passed for traffic.

No auctions were held at Tokenhouse Yard last week, and negotiations which had been begun for one or two properties have been deferred for a while. There are reports of a brisk demand for furnished houses, chiefly in the suburbs, and the rents obtained are said to be satisfactory.

The Secretary of State for India in Council has selected the following candidates to be probationers for the Indian Forest Service:—John MacQueen Cowan, Tom Overton Gerard, Eric Stewart Hartnoll, Jal Ardeshr Master, Donald Francis Neilson, John Wilfred Nicholson, Charles Winter Scott, Herbert Cecil Smith, Harold L'Estrange Tyndale-Biscoe.

The Local Government Board has sanctioned the borrowing by Ashton-under-Lyme Town Council of £42,000 for extensions to the electricity works, £14,000 for improvements at the sewage works, and £426 for alterations to the Textile School. The council has decided to put the work in hand immediately, in order to alleviate unemployment.

A Local Government Board inquiry was held by Mr. R. H. Bucknell at Blyth on Friday with reference to the application of the urban district council for sanction to borrow £1,000 for the extension of the public cemetery on the Links-road. It was stated that the cost of the two acres proposed to be added to the existing ground was £175 per acre.

A Local Government Board inquiry was held at the Bradford Town Hall on Thursday in last week with regard to an application for borrowing powers for £7,002 required in connection with various schemes. Of this sum, £5,740 was for the construction of an open air swimming-bath in Lister Park, £750 for the purchase of a vacuum gully-emptier, £575 for the purchase of a steam motor-wagon, £420 for the extension of the Eekhill Recreation ground, and £117 for the extension of Victoria Park, Oakenshaw.

At Monday's meeting of the rural district council for Chipping Solihury the housing committee reported that they had had under consideration the building of a certain type of house in blocks of four, at a cost of £725 per block. Estimates of rentals had been prepared at 4s. 1d., 4s. 10d., and 6s. per week, and the scheme favoured was the one to let at 4s. 1d. per week, the occupier paying rates. It was decided that the sanitary inspector and the clerk should interview the Local Government Board and explain the plans, and invite their suggestions.

Building Intelligence.

TUTBURY.—One of the few Norman churches in Staffordshire—that of St. Mary, Tutbury, near Burton, has just been restored at an expenditure of £1,600, and the new work was dedicated by the Bishop of Lichfield on Wednesday week. Standing on a commanding eminence and almost under the shadow of the castle ruins, the church has a remarkable wealth of original Norman work, although, unfortunately, it suffered considerably under the hands of 19th-century "restorers." It was originally a cruciform building, with a central tower, but only the western arm of the cruciform now remains; the central tower has disappeared, having been replaced by another of later date, which stands at the south-west corner. This western arm, which forms the main body of the present church, has now been restored to very much nearer its original state than it was a few years ago, its modern roof and chancel notwithstanding. The exterior of the church has been repointed, and every effort made to preserve the carved arch over the western door. On the southern side, another fine specimen of a carved Norman doorway, which had been converted into a window, has been reopened. The work has cost about £1,550.

PROFESSIONAL AND TRADE SOCIETIES.

FIRST ATELIER OF ARCHITECTURE.—Several members of the Atelier have enlisted, but those unable to do so are carrying on the work as usual, and the first esquisse of the autumn session was held last Saturday. An exhibition of work done during the summer term and of holiday sketches and figure drawings will be held on October 7, when the Atelier medal awarded for work done during the past year will be presented to Mr. L. H. Bucknell. The sous-patron, Mr. Chaurès, being now with the armies of France, two of the senior working members, Mr. Adrian Berrington and Mr. L. H. Bucknell, have undertaken to help the members, and do all they can to compensate for Mr. Chaurès's temporary absence. The patron and the members of the jury will also visit more often as appears desirable. A revised subscription for working members has been adopted, which should prove more economical and convenient, and lead to an increase of membership.

The Clyde Harbour Trust have voted £20,000 from estimated current expenditure towards new docks.

To provide employment for men thrown out of work by the war, the Reading Town Council has adopted a scheme of road-widening which will cost £13,000.

Liverpool, this autumn, was to have entertained the Municipal Waterworks Association, which had decided to visit the city and to inspect the unique scheme of water supply associated with the district. The reunion has, however, been abandoned for this season.

Schemes which might be undertaken in Edinburgh in the coming winter to provide employment were considered at a meeting of the Town Planning Committee of the Town Council on Friday. The construction of a road from Ravelston to Blinkbonny is one of the projected operations, and other roadmaking in the same district is contemplated. Ordinarily this work would have been done under a town planning scheme; but the consent of proprietors will be sought to expedite the undertakings.

The spital or chapel of St. James's, in the parish of Wigginton, and just outside the boundary of the borough of Tamworth, which has been repaired and made suitable for the holding of services, has been dedicated by the Bishop of Lichfield. The chapel was built in the Norman period. Nothing of its history is known until early in the last century, when the late Bishop Stere, of the Universities' Mission to Central Africa, purchased the chapel as a centre for the brethren of the Guild of St. Alban. The chapel has been restored under the direction of Mr. C. Lynam, F.S.A., Stoke-on-Trent.

Correspondence.

ARCHITECTS ENLISTING.

To the Editor of the BUILDING NEWS.

SIR,—Your readers will, no doubt, be interested to know that recruiting, for the Royal Engineer and other branches of His Majesty's forces, of architects and surveyors and their friends has continued very briskly since your last issue. We have good news of those already joined, who hope to welcome many more drafts to their ranks in the near future.

Although the Royal Engineers temporarily stopped recruiting at the beginning of this week, on account of the rush of recruits, they are now enlisting again, and men wishing to join should send in their names at once. Our next draft will meet here at 5 p.m. on Friday, the 11th, and present themselves for medical inspection at 8.45 the following morning.—I am, etc.,

ALAN POTTER,

Hon. Sec. A.A. War Service Bureau.
The Architectural Association, 18, Tufton-street, Westminster, Sept. 9, 1914.

BRITISH, NOT GERMANS.

SIR,—We have noted with interest and approval the influence which is being exercised by the Press and others to insure the adoption of British goods, and the campaign which has been commenced cannot fail but be to the ultimate advantage of British industries generally. But it is very necessary that every precaution should be taken that wrong conclusions (based on pure assumption or the statements of interested parties having ulterior objects in view) should be avoided.

It has come to our knowledge that the statement has been made, or the impression exists, that this company is to some degree under German influence, and in this connection we would state:—

1. This company has carried on business in England for upwards of sixty years. We were established at Millwall prior to 1854 and a few years later we moved to the site of our present premises, which, with the progress of years, have been enlarged and improved.

2. There is not a single German connected with the company, either as shareholder, director, or employee. All are British born, bred, and educated, with the exception of a few experienced Italian asphalters, who are employed for special work, and which plan is adopted by all the responsible houses in the asphalt trade.

3. There is not a penny of German or other foreign capital in this company, the whole of the shares being held by English-born men and women resident in this country. Further, neither this company nor any member thereof has any connection with German or other foreign concerns.

4. For many years we have been contractors to H.M. Government for various materials, such as roofing felt, hair felt, asphalt, etc., and for the years 1910-11-12 we were successful in securing the War Office and Admiralty contract for asphalt work, the execution of which necessitated the admittance of our representatives and workmen to practically every fortification and depot of the War Office and Admiralty in the British Isles where our work was required, and to which foreigners are not admitted. This contract was given to us after the usual exhaustive inquiries in regard to the constitution of our company had been made by the War Office authorities.

5. All goods supplied by us are manufactured here at our works in Poplar.

Possibly your extended experience of our house in itself will substantiate what we are saying, and doubtless there are many architects, surveyors, and builders some of whom (although very probably now retired) have done business with us over half a century ago.

In conclusion, it might be pertinent to add that on an appeal issued to our factory em-

ployees by our managing director (who, we believe, rightly held the view that the seriousness of the present situation had not been fully recognised by at least some of our workpeople), several of our single employees have enlisted, the percentage of acceptances being over 80 per cent. of the applicants. Their places are being kept open for them, but in the meantime will be filled by married men, and it may not be necessary for us, ultimately, to dispense even with the latter's services.—We are, etc.,

ENGERT AND ROLFE, LTD.,
C. ENGERT,
Managing Director.
Poplar, E.

[Every word true, and every job we have known during the past sixty years a credit to this old-established house—the reputation of which is second to none.—ED. "B.N."]

Intercommunication.

GUINEAS FOR BEST REPLIES.

We offer a prize of one guinea every week for what we deem the best reply to any query appearing in this column, which we deem worth insertion.

Replies must be sent in over real name and address. No others can receive a prize. The Editor's judgment is final.

This competition is restricted to buyers of the paper, and with each reply a coupon cut from our front page must be enclosed.

Any number of replies can be sent, but a coupon of this date must accompany each.

All else being equal, brief replies will stand the best chance. We emphasise this, as some correspondents ignore the fact that querists want terse facts, not long essays. Any necessary illustrations must be in line only—no tints or washes—and about twice the size they are meant to be reproduced. We are unable to avail ourselves of replies that contain illustrations unless we receive them by first post on Tuesdays.

The right to withhold the prize in the event of no reply being received worthy of it is reserved by the Editor, who also claims the right to publish any other replies he may deem useful.

We divide the guinea between Mr. K. H. Read and Mr. Chas. A. Longley.

REPLIES.

[12148.]—WEIGHT ON BEAMS.—The formula required for this problem is $W = \frac{c b d^2}{L}$. Where W = weight in cwt., c = constant, b = breadth in inches, d = depth in inches, and L = span in feet. The constant for pine is 3 for a breaking load in the centre when

DERRICK

concentrated; so for a safe load it would be rather as one-fourth of that amount. Then—

$$W = \frac{3 \times 7 \times 7^2}{4 \times 13.3} = \frac{102.9}{53.2} = 19\text{cwt.}$$

so that 19cwt. \times 3 beams = 57cwt.; therefore load equals 2 tons 17cwt. Had the beams been bolted together they might have been treated as one beam, when on the same formula they would carry just over twice the amount—i.e., six tons. The load has been treated as a concentrated load at the centre, as this is the most likely place for the crane to be placed. If it is distributed over a portion of the beam, such load should be treated as acting at its centre of gravity. I would remind "Simple Method" that allowance must be made

for the weight of the crane itself, and also the men who will be working same, if they do so from the platform of beams. Also to see that his R.S.J.'s are of sufficient strength, by reference to a manufacturer's list of sizes and loads. Of what nature the crane will be we have no particulars. Is it a 10in., or a derrick with mast, jib, and stays? If the latter, a balancing weight to the base of the mast will be required, or else the load on the top of the mast may "kick" the base off the platform.—K. H. Read, Technical Schools, Gloucester.

[12148.]—WEIGHT OF BEAMS.—The accompanying diagrams show the method of ascertaining the combined crane load that the three 7in. by 7in. pitch-pine beams,

placed 12in. apart and over a clear span of 13ft., will carry. For the ordinary crane working central the load will be concentrated towards the centre, but will actually cover a space of 3ft. 6in.; so the load will be a live load distributed over an area of 3ft. 9in. superficial.

By the empirical formula, $W = \frac{c b d^2}{L}$, gives the breaking weight as 133cwt. per beam, which equals 19cwt. safe load, allowing a factor of safety of seven, taking into consideration the weight of the beams, crane, and crane staging, the possible loads in their most severe positions as regards stresses, and thus allowing for sudden jerks in lifting and lowering, including sharp turns. The three beams will safely support a crane to lift loads not exceeding 2 1/2 tons in and to any position. The three pitch-pine beams should be bolted together at their ends, and securely fixed and bolted to the rolled steel joists, as shown by the lower sketch plan.—Chas. A. Longley, 52, Ivanhoe-road, Denmark Park, London, Sept. 7.

[12148.]—WEIGHT ON BEAMS.—Firstly, find the breaking weight of one beam by means of the empirical formula $BW = \frac{k \times b \times d^2}{L}$, where BW = breaking weight

of beam in cwt., k = breaking weight in cwt. of a pitch-pine beam 12in. long and 1in. broad and 1in. deep

when centrally loaded and supported at ends. This has been found by experiment to be 5cwt., b = breadth of beam in inches, d = depth of beam in inches, and L = length of beam in feet.

$$BW = \frac{k \times b \times d^2}{L}, \text{ substituting } BW = \frac{5 \times 7 \times 7^2}{13}$$

Clear span may be taken as being 13ft. Then $BW = 131 \frac{1}{2}$ cwt., say 132cwt. The breaking weight of the three beams will be 132 \times 3 = 396cwt. As the load is intermittent it is not advisable to load to more than 1/10th of the breaking weight. Safe load is 396cwt. = 39.6cwt., say two tons. Of course this load includes weight of crane, etc. If it is desired to manipulate loads above this weight and still use the 7in. by 7in. beams, they may be strengthened by trussing, as in rough sketch.—H. J. Wilson, A.R.I.B.A., Cumbergate, Peterborough.

[12148.]—WEIGHT ON BEAMS.—By using Hurst's formula— $W = \frac{c b d^2}{L}$, where—

W = breaking weight in cwt.
 C = weight in cwt. required to fracture a bar 1in. square and 1ft. long, and which for pitch-pine = 5cwt.
 b = breadth in inches.
 d = depth in inches.
 L = length of span in feet we get—

$$W = \frac{5 \times 7 \times 7 \times 7}{13.33} = 125.65\text{cwt.}$$

Take F.S. of 4, giving 32.16cwt. safe load in centre of 7in. by 7in. p.p. beam over 13ft. 4in. span. Therefore the three beams will safely carry a centre load of

96.48cwt.—i.e., if the crane base is distributed on the beams at their centre. As a centre load produces the maximum bending moment, the load of 96.48cwt. could be placed anywhere between the supporting joists (R.S.J.), providing it is distributed on the three beams.—Ernest A. Salter, 8, Lock View, Bingley, Yorks.

[12148.]—WEIGHT ON BEAMS.—The safe load for pitch-pine beams is found by the following formula, which is applicable to all beams, and any system of loading:—

Bending moment (BM) = moment of resistance (MR)
 $MR = Z \times C$

$$Z = \frac{I}{y}$$

$$I = \frac{b d^3}{12}$$

$$y \text{ for rectangular beams} = \frac{d}{2}$$

Hence—

$$I = \frac{b d^3}{12} = \frac{b d^2}{6} \times \frac{d}{2}$$

BM for beams fixed at ends with distributed load—
 $= \frac{WL}{12}$

Z = modulus of section; C = coefficient of rupture; I = moment of inertia; y = distance from neutral axis to extreme edge of section; b = breadth of beam in inches; d = depth of beam in inches; W = total breaking weight; L = length of beam in inches. The coefficient of rupture is, according to Rankine, 15 times the weight required to break a strip of material 1ft. long, 1in. square section, centrally loaded. For pitch-pine this is about 5cwt., and multiplied by 15 gives a coefficient of rupture of 90cwt. Now—

$$BM = MR$$

$$\frac{WL}{12} = M \frac{1}{y}$$

$$W = 90\text{cwt.} \times \frac{1}{15} \times \frac{b d^2}{6} \times \frac{L}{12}$$

$$= \frac{90 \times 7 \times 7 \times 7 \times 12}{13 \times 12} = 396\text{cwt.}$$

Allowing factor of safety of 1/5, the safe distributed load = say, 4 tons. The three pitch-pine beams will, therefore, safely carry a distributed load of 12 tons. If the beams merely rest on the R.S.J., and are not fixed, the

$BM = \frac{WL}{8}$ —O. Lewis Abbott, City Surveyor's Office, Town Hall, Manchester.

[12148.]—WEIGHT OF BEAMS.—One of the simplest methods to find the weight which the beams will carry is by the following formula. In the case stated the weight will be a distributed load.

$$BW = \frac{8 k b d^2}{L}$$

which is arrived at by the following method—

$$BM = MR$$

$$\text{For all rectangular beams } MR = \frac{f r b d^2}{6}$$

$f r$ = modulus of rupture.

$$\therefore BM = \frac{f r b d^2}{6} = k b d^2 \text{ where } k = \frac{f r}{6}$$

For a distributed load—

$$BM = \frac{BWL}{8} = k b d^2$$

$$BW = \frac{8 k b d^2}{L}, \text{ or } SL = \frac{8 k b d^2}{15}$$

Where k = constant found by experiment. For P.P. 15 b = breadth of beam; d = depth of beam; L = length of beam in inches; S = factor of safety; SL = safe load in cwt. Substituting figures given—

$$SL = \frac{8 \times 15 \times 7 \times 7 \times 7 \times 3}{15 \times 12 \times 13} = 1.029$$

= 51 1/2cwt. nearly, or nearly 5cwt. per foot run.—John Lamond, C.S.O., Town Hall, Manchester.

STATUES, MEMORIALS, &c.

CITY.—There has been placed in position a piece of sculpture to complete the block of buildings recently erected in Lombard-street for the Royal Insurance Company. It consists of a colossal group of three figures in bronze, and is fixed over the granite hood of the main doorway in Lombard-street. The figures symbolise to some extent the main activities of the company—viz., Life, Fire, and Marine interests; but, subservient to its symbolism, the prime object has been kept in view of making the group an appropriate and harmonious portion of the fine architectural design as a whole. The central figure is a winged Sphinx seated upright, with its forepaws upon a globe. There are two subsidiary semi-draped female figures on either side of the Sphinx. On the right is a strong figure, alert in attitude and pose, with flying hair and turbulent drapery, grasping in the left hand a flaming torch, suggesting the latent power and energy of Fire. The figure on the left represents a Sea-nymph or Siren with a dolphin-twined anchor. The figure, as a whole, is intended to symbolise the mighty power of the sea for good or ill over our wide maritime interests. The group has been designed and sculptured by Mr. Francis Doyle-Jones, of Chelsea, acting under the instructions of Messrs. Gordon and Gunton, of Blomfield-street, the architects of the building.

LEGAL INTELLIGENCE.

THE QUANTITIES SURVEYOR'S CLAIM.—

A case was recently heard at the Leicester County-court, before Judge Cann, in which Hugh Carpenter, architect and surveyor, Gotha-street, Leicester, brought an action against the chairman (the Rev. Father Lindeboom) and committee of the Sacred Heart Church, Leicester, to recover £90 due to him for professional services in designing, planning, and preparing plans for a new church on the Mere-road, to seat four hundred, with three aisles, of a Roman (Classic) design. The plaintiff, reports the *Leicester Daily Post*, gave evidence that in 1911 he began to attend the Church of the Sacred Heart. At this time collections were being taken on behalf of the building fund for a proposed new church, about £400 having been contributed. One Sunday the Rev. Father Lindeboom asked him to get out plans for a new church to seat four hundred, and witness advised that the work should be carried out in sections. It was eventually decided not to start building until £1,000 had been raised. Witness took levels and measurements, and prepared a ground plan, as well as plans of the side elevation and the front elevation, the work involving twenty-two days. The plans were submitted to a parish meeting, and accepted, and two of the plans were exhibited in the church porch. At a subsequent meeting the Rev. Father Lindeboom asked him if he required payment, and when he told him "Yes" he flew into a temper and said he would pay out of his own pocket. It was decided, however, that his charges should be paid out of the proceeds of special collections. He sent in his bill for £90, and when it was submitted to a building committee which had been appointed, that committee got up and resigned. Cross-examined, plaintiff admitted that in 1905 he was made a bankrupt. He was then described as a boot and shoe dealer; but a manager was carrying on the business, which was in the nature of an investment. He was still carrying on his profession as a quantity surveyor. He denied that he was carrying on the business of an accountant in 1909.—What religion were you in 1909? asked Mr. Simpson. Were you a Primitive Methodist, Roman Catholic, or Church of England?—Church of England, replied plaintiff.—What church did you honour by attending in Leicester? I have attended several.—In answer to questions about his qualifications as an architect, plaintiff caused some laughter by remarking, "When you are apprenticed to a lawyer, you are a lawyer."—Re-examined, plaintiff declared he was asked to design complete plans, and Father Lindeboom never asked him for a rough sketch. He never said he would leave the amount of the bill an open question.—Mr. Simpson: Did I understand you to say you were sole architect for St. Augustine's Church, Leicester? I do.—Was not Mr. Goodacre, of Leicester, the architect for St. Augustine's? Yes; but I did the work.—Did you not work under him? No; with him.—Was not his name on the plans? Yes, with mine.—Two architects were called, who expressed the opinion that the plans were properly got out, and that the charge of £90 was a reasonable amount.—For the defence, Father Lindeboom said he asked defendant, who had been coming to him for religious instruction, to make rough sketches or drawings of a church to seat four hundred persons. Plaintiff promised to do so, but only produced two sketches. At the outset he did not understand that plaintiff was going to make a charge, and was surprised at the amount charged when the account came in. In cross-examination, witness said he expressed surprise when plaintiff produced elaborate plans.—Mr. Wm. M. Cowdell and Mr. A. H. Hind, two Leicester architects, expressed the opinion that £10 would be a fair price for the two sketch plans produced. The last named added that the sketches looked like the work of a novice.—Witnesses were called who gave evidence that it was understood at the outset that plaintiff proposed to make sketch plans without charge.—His Honour said that, considering all the evidence, and looking at the circumstances disclosed by the evidence, he was bound to come to the conclusion that the statement made by Father Lindeboom was substantially accurate. He dismissed the action, but suggested that the £10 paid into Court by the defendants be paid over to the plaintiff, though there was no obligation upon them to do this.

MR J F EBNER FINED FOR POSSESSING ARMS WITHOUT PERMISSION OF THE REGISTRATION OFFICER.—According to a report in the *South-Eastern Herald* of Sept. 1, at Greenwich Police-court, on Friday last, Joseph Francis Ebner, 66, of 9, Vauxhall park, Blackheath, black-floor manufacturer, and Hungarian subject, was charged, as an alien enemy, with having possession of a breech-loading gun, a

Winchester repeating rifle (stock missing), a revolver, and three sporting rifles, without permission of the Registration Officer. Mr. Solomon defended.—Div. Det.-Insp. Brown said that on Thursday evening he went with Insp. Pullen and other officers to prisoner's house. He said: "I understand you have some firearms in your house, and when you registered you failed to disclose that fact, and further stated that you had none when asked." Prisoner said, "I was not asked." Witness said he would take possession of the firearms, and prisoner conducted him to his son's bedroom and handed him the guns, which he said belonged to his son. Witness saw the revolver in the hall, and took possession of it. At the station prisoner said, "I was never asked if I had any firearms." Witness also took possession of four old-fashioned pistols which were in the hall. He found no ammunition.—Cross-examined: There was no concealment. He did not think the revolver was out of date, but it might be fifty years old. It was a pinfire revolver. One of the old pistols was a flint-lock, and they appeared to be trophies.—Insp. Robeson said that on August 14, when the prisoner registered, he was asked if he had any firearms, and witness read to him the section of the Act relating to the possession of firearms. The prisoner spoke rather strongly about being deprived of the use of the telephone.—P.S. Connor, 91R, said that, when he registered, prisoner said he was born at Budapest, Hungary. Witness read the order, and asked prisoner if he had anything to declare. He seemed to lose his temper, and described the Order as preposterous and ridiculous, saying he had lived in England forty-four years, and did not think he should come under that category.—Mr. Solomon: He felt the indignity of the position.—Mr. Symmons: It is not an indignity; it is only a proper precaution. His Worship pointed out that the telephone could be used if a permit were obtained.—Edgar Ebner, 27, son of the prisoner, said he was a British subject, born in England. The double-barrelled sporting gun and two miniature rifles belonged to him, and the other rifle to his brother Frank, who was also a British subject. He had seen the revolver hanging in the hall ever since he could remember. He had never seen any ammunition to fit it. His brother was an engineer in the P. and O. Company, and was in Bombay.—The prisoner, sworn, said he employed about three hundred men. He was married in England. On the day the notice was in the newspapers he went to a police-station to register, and was referred to Blackheath-road, where he went next day. The paper of regulations was handed to him to read, but he did not think it was read to him. He was asked if he had a motor-car. He was upset at the time about being unable to go to his bank without a special permit, and about the telephone. He had never used the revolver in this country, and it was used as an ornament. He had read in the daily papers of similar prosecutions to this.—Mr. Solomon said the revolver was obsolete, and ammunition for it could not be obtained in this country. It was merely an ornament. He suggested that there had been only a technical offence; but he asked his Worship not to inflict even a fine, for it would have a prejudicial effect on the prisoner as an employer.—Det.-Insp. Brown said, in reply to the magistrate, that he had no reason to suppose the prisoner kept the firearms with any sinister motive.—Mr. Symmons said the prisoner's defence was merely due to carelessness. He fined the defendant 20s.

EXETER BUILDER'S LOSSES.—At the adjourned bankruptcy examination, at Exeter, on the 3rd inst., of Walter Baker, builder, Magdalen-road, debtor said since the last examination he had filed certain accounts setting out his losses, but they were more or less guesses. He had no books from which he could make an absolutely accurate account. According to the summary he had lost £2,236 on three estates. The examination was closed.

In our description, with the illustration, on August 28, of the County Offices at Maidstone, we did not mention (because at the time we did not know) that Messrs. Carter and Co., Ltd. of Poole, and 29, Albert Embankment, S.E., carried out a good deal of the terrazzo and marble mosaic in the building.

The Commercial Intelligence Branch of the Board of Trade at 73, Baringhall-street, E.C., are desirous of hearing from firms who are prepared to send to them samples or catalogues of German and Austrian or Hungarian goods which have competed with British products at home or abroad. The Board of Trade propose to hold an exhibition of samples of this nature, and would welcome the co-operation of British manufacturers and traders.

Our Office Table.

A deputation from the National Housing and Town Planning Council had an interview on Friday with representatives of the National Federation of Building Trade Employers of Great Britain and Ireland and the Institute of Builders for the purpose of discussing the administration of the new Housing Act, 1914. The representatives of the council were assured that the National Federation and the Institute would recommend builders throughout the country to co-operate with local authorities in the administration of the Act, with a view to keeping down the cost of cottage building during the war. The question of the rise in the cost of building materials was discussed, and it was decided that the President of the Board of Trade should be asked to receive a joint deputation asking for definite action to be taken by the Government to regulate the prices of building materials, and especially of those required for the building of cottages under the new Housing Act.

The city council of Bristol devoted considerable time on Tuesday to the discussion of the housing scheme submitted by the health committee at the July meeting. The scheme provided for the acquisition of sites at Parson-street, Bedminster, and near Fox-lane, Stapleton-road, and the erection on the former of 120 self-contained houses and eight double tenements, to accommodate 136 families, and on the latter 45 self-contained houses and 35 double tenement houses to accommodate 115 families. The estimated cost of land and buildings was about £49,000. The rentals proposed were 5s. 6d. per week for the self-contained houses, and 3s. 9d. per week for each tenement. It was estimated that at first there would be a deficit of about £600 a year, but the committee thought the loss would gradually disappear. When the committee's report came before the council in July it was criticised on the ground that it did not touch the question of the slums, and meant subsidising wages from the rates. On the resumption of the debate on Tuesday, the altered conditions, resulting from the war, were thrown into the weight of opposition against the scheme. It was pointed out that the increase in the price of building materials had made it necessary to revise the estimates to the extent of about £20 per house, raising the total cost from £49,054 to £52,734; in addition to which, it was stated that it would be impossible to borrow the money at a lower rate of interest than 4½ per cent., instead of the absurdly optimistic original estimate of 2½ per cent., and the deficit would be increased from £600 to £1,740 per annum. A proposal was adopted, the effect of which is that the health committee are to purchase the Parson-street site, but that no expenditure for the erection of houses thereon be incurred for the present; the remainder of the housing scheme being referred back to the committee.

The housing committee of the Liverpool City Council has decided to obtain and place before the October meeting of the city council tenders for rebuilding in Gore-street, Jordan-street, and Sparling-street areas. The amount sanctioned for expenditure is about £25,000. Further, the committee instructed the surveyor to facilitate the acquirement of sites for rebuilding in Prince Edwin-street, Mason-street, Penrhyn-street, Ratliffbone-street, Blenheim-street, Saltney-street, and Dublin-street extension. These schemes will cost approximately £120,000. A deputation representative of St. Alban's parish was introduced by Mr. John Clancy, the object being to induce the committee to undertake building schemes to replace the cellar dwellings closed. Much valuable information was obtained, and the committee, after promising full consideration, resolved to ask the city surveyor to furnish a report dealing with the situation thoroughly.

In his annual report to the Belfast Corporation, Mr. Hector F. Gullan, M.Inst.C.E., the superintendent of works, states that during the year three miles of

streets were added, making the total mileage of public thoroughfares throughout the city 309 miles, including 144 miles of pebble-paved carriageways and back passages, 25½ miles of self-paved carriageways, 135 miles of macadam, 1 mile of wood-paving, 3½ miles of tar-macadam, and 39yd. of asphalt. The estimated expenditure on general repairs for the year was £30,000, and the actual expenditure £28,915. The cost per mile was £93.64 as compared with £118.07 ten years ago. For street cleansing the estimated expenditure was £31,950, and the actual expenditure £30,877. The cost per mile was exactly £100, as compared with £120.86 ten years ago.

The British Brush Manufacturers' Association has held a special meeting to consider the serious situation produced by the stoppage of supplies of bristles and other hair from Russia, Siberia, Germany, Poland, and France. The limited stocks of these materials in England are being rapidly used up, and the prices have consequently advanced enormously. Owing to smaller exports from the Far East, Chinese bristles have also risen in price very considerably. Other raw materials, such as timber, wire, etc., are also affected. The association officially announces that the prices of brushes and brooms have of necessity already been advanced, and that further considerable advances will be inevitable in the near future.

In a paper recently published in the Journal of the Western Society of Engineers an account is given of the system of concreting through open spouts now largely adopted in America. The concrete is mixed to such a consistency that it flows readily along these spouts and into the forms. If too wet, the water drains out and the spout blocks; and, similarly, if the concrete is too stiff, it will not flow. With the proper consistency, however, it flows readily, and it is claimed that the forms are filled more solidly than when a stiffer mixture is used and rammed. The system in question has, Mr. B. J. Sweatt states, been used for the concreting of a large arched bridge at Cedar Rapids, Iowa, constructed in reinforced concrete. The bridge, which is 308ft. long between abutments, has three spans of 96ft. each, the roadway being 48ft. wide, bordered by two footpaths, each of a clear width of 10ft. The whole of the concrete was distributed to the required positions from a high tower, from which the distributing spouts were fed. The system is claimed to be an ideal one where the length to be covered does not exceed 300ft. from the tower. From the discussion it appears that a gradient of 1 in 7 is a good slope for the spouting.

MEETINGS FOR THE ENSUING WEEK.

SATURDAY (To-morrow).—Institution of Municipal Engineers. Meeting of the Northern and Yorks Districts at Harrogate.

THURSDAY.—Royal Photographic Society's Exhibition, Suffolk-street Galleries. "A Short Sketch of Gothic Architecture," by Henry W. Bennett, F.R.P.S. 8.30 p.m.

An inquiry has been held at Lowestoft by Mr. A. W. Brightmer into an application to the Local Government Board for sanction to borrow £11,120 for works of sewerage in the borough and also in the urban district of Oulton Broad and the parish of Oulton. The borough engineer, Mr. G. H. Hamley, produced and explained the plans.

The British Standard Specification for Two- and Three-Plate Ceiling-Roses has just been issued by the Sub-Committee on Electrical Plant Accessories of the Engineering Standards Committee, who have had the assistance of the British Electrical and Allied Manufacturers' Association. The standardisation of two and three pin-plug fittings is being proceeded with; but it has been thought that it would be most convenient to issue separate specifications, so that standardisation, as far as it has gone, might be taken up at once. This report (No. 67) specifies the material to be used and the dimensions of all essential parts. The terminal-plates are of different shapes—a system which the committee consider more satisfactory than the use of different colours.

Trade News.

WAGES MOVEMENTS.

PERCENTAGES OF UNEMPLOYMENT IN VARIOUS TRADES.—The Board of Trade issues the following statement of unemployment:—In the trades compulsorily insured against unemployment (viz., building, works of construction, engineering, shipbuilding, vehicle-making, etc.) the percentage of unemployment at September 4 was 6.24. This is practically the same as the percentage a week before (6.20), and compares with a percentage of 3.34 a year ago. The growth of unemployment in the insured trades has therefore for the moment stopped. Indeed, in engineering, construction of vehicles, and sawmilling there is an actual decline of unemployment. This is counter-balanced by a slight seasonal increase of unemployment in building and construction of works.

WAGES IN VICTORIA, AUSTRALIA.—It is stated authoritatively that the Railway Commissioners of Victoria have agreed to concede the rate of wage laid down by the Wages Board award—from 8s. 8d. to 10s. 8d. per day—to the following men: Scaffolders, hod-carriers, plasterers' labourers, concrete-packers, and tackle hands. These men are at present paid from 8s. to 9s. per day. The wages of general handymen will not be altered. Owing to the proposed increases of pay, the expenditure on railway electrification work in Melbourne will be considerably increased.

OHIPS.

The death is announced of Mr. W. H. D. Horsfall, architect, of Low-street Chambers, Halifax.

Mr. T. H. Bishop, jun., of Leighton Buzzard, has been appointed surveyor to the Eaton Bray Rural District Council.

Mr. William R. Maxwell, C.E., burgh engineer and chief sanitary inspector, Dunfermline, has tendered his resignation.

Mr. E. P. Hooley, M.Inst.C.E., county surveyor of Nottinghamshire, is serving with the 5th Battalion of the Sherwood Foresters.

The Local Government Board have given their formal sanction to the borrowing by the city council of Oxford of £1,400 for the sewerage of the Headington Hill district of the borough.

The plans of Mr. P. J. Krouse have been adopted for a city-hall building to be erected at Meridian, Mississippi. Tenders will be opened for the work on Tuesday week, the 22nd inst.

A receiving order has been granted in the case of Frederick Bligh Bond, Glastonbury, carrying on business at Star Building, St. Augustine's-parade, Bristol, and at Glastonbury, architect.

The town council of Wallasey have under consideration a scheme for the erection of thirty-two workmen's houses and eighteen cottage flats on land between Poulton-road and Love lane, Poulton, at an estimated cost of £11,546.

The will of Mr. Walter Sturge, lte of 11, Downfields-road, Clifton, Bristol, land surveyor, who died on August 6 last, has been proved by the executors, Messrs. Francis Sturge and Theodore Sturge at £11,882 19s. 10d. gross, with net personality £10,343 5s.

The Southam Rural District Council have instructed Messrs. Taylor and Wallin, civil engineers, of Newcastle-on-Tyne and London, to prepare a scheme and report upon a water supply for the parish of Southam, with an extension for supplying the adjoining parish of Long Itchington. The water will probably be taken from a well, and pumping machinery will be required.

It was officially announced on Tuesday that out of sixty candidates for the assistant general secretaryship of the Amalgamated Society of Carpenters and Joiners, the following six have been selected for submission to a members' ballot:—Messrs. Cameron (Paddington), Dearnley (Huddersfield), Lindley (Sheffield), Robertson (Bolton), Wright (Glasgow), and Young (Clapham). The membership of the society was returned at 89,543.

The Calendar of the Glasgow School of Art, which is under the directorate of Mr. Francis H. Newbery, has just been issued. Students are trained as painters of landscape, the animal, the figure, and for mural decoration; as architects, as modellers and sculptors, as designers and decorative artists and workers in the arts and crafts, and as art masters and mistresses with special teaching qualifications.

LATEST PRICES.

N.B.—All prices must be regarded as merely approximate for the present, as our usual sources of information are in many cases failing us. Miscellaneous metals and timber we omit altogether, as published figures differ so widely that they are, we fear, in many cases quite unreliable.

BRICKS. (All prices net.)

Table listing various brick types and prices, including First Hard Stocks, Second Hard Stocks, Mild Stocks, Picked Stocks, and various facing bricks.

Net free on rail, or free on boat at works.

GLAZED BRICKS.

HARD GLAZES (PER 1,000).

Table listing glazed brick types such as White, Ivory, and Best Salt Glazed, with prices for different finishes and quantities.

MOULDED BRICKS.

Table listing moulded brick types like Stretchers and Headers, Sill Bullnose, and Majolica, with prices per 1,000.

Table listing various types of Portland Cement and Lias Lime with prices per ton.

STONE.

Table listing stone types such as Red Mansfield, Darley Dale, and Orey Stone Lime with prices per foot cube or per ton.

* All F.O.R. London.

Table listing various types of Bath Stone and Portland Stone with prices per foot cube.

TILES.

Table listing various types of roof tiles, including Plain red, Hip and Valley, and Selected Perfecta, with prices per doz. or per 1000.

OILS.

Table listing various types of oils such as Rapeseed, Cottonseed, Olive, and others, with prices per ton or per gallon.

GLASS (IN CRATES).

Table listing various types of glass sheets and plates with prices per square foot.

VARNISHES, &c. Per gallon.

Table listing various types of varnishes and finishes with prices per gallon.

A return by Mr. Alexander Walker, city assessor, shows a large decrease in the number of unoccupied houses in Glasgow for the year which ended in June.

The Rochdale Corporation health committee have authorised the medical officer to prepare a scheme for re-modelling an area about four acres in extent, and now containing a large number of dwellings either condemned and unoccupied or in very poor condition.

TRADE NOTES.

We understand that the new bath at the Kendal Grammar School has been treated with the powder Pudlo (to make the cement waterproof), and that the architect reports a very excellent result.

Under the direction of Mr. E. Guy Dawber, architect, 22, Buckingham-street, Adelphi, W.C., the Boyle system of ventilation (natural), embracing Boyle's latest patent "Air-pump" ventilators and air-inlets, has been applied to St. George's Church, Campden Hill, W.

The Northam and Islandshires Rural District Council (Northumberland) have instructed Messrs. Taylor and Wallin, civil engineers, of Newcastle-on-Tyne and London, to prepare a scheme of drainage for the colliery district of Sermerston. The scheme will be wholly by gravitation, and no pumping will be required.

Messrs. Pridie, Stacey, Brewster, and Trenchard have amalgamated their respective practices as from August 10, 1914, under the firm name of Pridie, Stacey, Brewster, and Trenchard, with the short title of "Pridie and Co." Mr. Gerald A. Stacey, as from the date of this notice, will discontinue the use of his office and telephone at 3, Lombard-court, E.C., and the new firm's address for the future will be 25-28, Crosby-buildings, London, E.C. Telephone, Central 9982.

Olivers' Seasoned Hardwoods, W.M. OLIVER & SONS, Ltd., 120 Bunhill Row London E.C.

TENDERS.

** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender; it adds to the value of the information.

ABERDARE.—For the erection of new engineering laboratories and mining laboratories at boys' county school, for the Glamorgan County Council. Mr. D. Pugh-Jones, F.S.I., Cardiff, county architect.— Davies, T. D., Treycynon, Aberdare (accepted) ... £1,298 14 0

ABERKENTH.—For the erection of a new county school at Aberkenth, for the Glamorgan County Council. Mr. D. Pugh-Jones, F.S.I., Cardiff, county architect.— Price, E. L., 106, Wyndham-crescent, Cardiff (accepted) ... £3,359 0 0

ABERTHAW.—For converting an old building into combined domestic science centre, for the Glamorgan County Council. Mr. D. Pugh-Jones, Cardiff, county architect.— Julian, A. W., Bonvilston-road, Yard, Pontypridd (accepted) ... £305 7 1

ANDOVER.—For repairs to the old engines, for the corporation.— Bibbie, Hobson, and Co. ... £90 10 6

ASHFORD.—For the construction of an ejector station, with pneumatic ejectors and air-compressing plant, and a set of sewage purification works, for the managers of the West London District Schools, Ashford. Mr. A. J. Martin, M.I.C.E., 7, Victoria-street, Westminster, S.W., engineer.— Kaynagh, S., and Co., Surbiton-Hill, S.W. (accepted) ... £2,488 9 11

GAZE and Sons, Ltd., Walton-on-Thames ... 2,270 0 0

AYLESBURY.—For construction of an electric-light station, for the urban district council.— Crook and Judd, Waddesdon ... £1,268 9 7 (recommended for acceptance.)

BARHAM.—For lighting the workhouse by Cox's air gas, for the Bosmere and Claydon Rural District Council.— Mann, Egerton, and Co. ... £311 0 0 (Accepted.)

BARRY.—For laying-out of grounds at the Barry Training College, for the Glamorgan County Council. Mr. D. Pugh-Jones, F.S.I., Cardiff, county architect.— Rendall, H. S., and Sons, Barry. ... £3,012 7 5 (Accepted.)

BARWELL.—For the erection of an iron steam roller shed, for the Hinckley Rural District Council.— Davis Bros., Wolverhampton ... £108 10 0 (Accepted.)

BEVERLEY.—For erection of a school for 100 scholars at Minster Meorgate school, for the Managers of the Minster Schools, Beverley. Messrs. Howe and Foley, North Bar-street, Beverley, architects. Quantities by architects.— Lorenz, H. ... £1,200 13 0

Potts, R., and Sons ... 1,100 16 0 Pape, G., and Sons, Beverley* ... 1,098 0 0 * Accepted.

BURLEY.—For heating chapel and schoolroom, for the Primitive Methodist Soc. Trustees. Mr. C. Bailey, 23, Peel-place, Burley, architect.— Vincent, Roberts, and Co., Charnmouth-street, Leeds (accepted).

(Eight tenders received.)

HISTORIC DESIGN.

We are all busy "capturing trade" just now—or talking about it—and, so far as the endeavour proves a genuine outcome of a real awakening of the national consciousness, it is well. Even in the most mechanical avocations it will be something gained if we have learnt presently that to make for use and not for mere profit is a cardinal essential. To make for the uses, that is, of our buyers, with their many and diverse needs, and not merely according to our short-sighted persistence in the belief that British "solidity" must be taken with thanks, and paid for cash in advance, by our Colonial and foreign customers, who have deserted us, tired of our stereotyped methods, and attracted by the adaptiveness of rivals who have discovered that which we have in many instances been too blind to see, or too purse-proud to admit, that the first and indispensable task of the manufacturer is to ascertain and study the actual requirements of buyers, and to set himself in all earnestness to meet them. In many cases, as all must know who have carefully studied the reports which the Board of Trade is now issuing, it has been far otherwise. If the British manufacturer had set himself as industriously to make and sell what was wanted, instead of persuading his customers that what he persisted in supplying was as good—or quite good enough for them, he would have been less frequently ousted in the markets of our own great self-governing colonies, or forced to confess failure to find a footing in those opened up elsewhere by political and social changes.

If this troublous time has really taught some of us this stern lesson, if British valour in the field and on the seas, unhampered for once by official unreadiness, has proved to the world that the response of the race to the call of real patriotism was as ready and certain as by our forbears in Elizabethan days, let us humbly and thankfully remember that it might all have been futile, if, at the helm, our organisers had not been true students of what in Art some of us call "historic design," shackled as they have been by those who failed to recognise that courage, and self sacrifice, and all the traits and traditions of an Imperial race availed little against the ignorance of those who knew not that fitness was the first need in war, and that, given the real efficiency of the units, and proper equipment, the expansion of our forces in proportion to our needs was easy. With all our heart we trust that lesson will not be lost on those responsible; but that returning peace will see the steady and increasing insistence on the ability of the manhood of the nation to fit itself for defence, not by cast-iron compulsion on the lines of German militarism, but by means not merely submitted to but welcomed by

all the instincts of a free people. Given that, and the good guidance of those who to some purpose have studied "historic design" in War, we shall get a practically inexhaustible reserve of disciplined strength, which no enemy will treacherously provoke, or insult by the suggestion that it shall regard solemn obligations as "scraps of paper."

Moreover, we earnestly believe that this organisation of national defensive strength must and will bring with it proper and disciplined training in our ordinary work; because, accustomed to and benefiting by the one, the disciplined citizen will submit to no other. He will trust no teacher or master who cannot really teach or govern, but will bend all his energies to assimilate the experience of the one or to obey the intelligent orders of the other. By degrees he will evolve capabilities of resource which no mere man-machine can ever cultivate or exercise, and, almost insensibly, the faculties of the British workman will be developed on a higher plane than they have yet reached, and the national industrial output will benefit accordingly, not merely in mass, but in quality and suitability to purpose.

Surely in no field of industry are the prospects of properly disciplined efforts to effect this more promising than that covered by the crafts more or less connected with art. Hitherto most of us have failed to perceive that, ignoring all other considerations, no more wholesome betterment of individual welfare or extension of industry generally is likely than by the cultivation of real art in handicraft or manufacture. It may be and is argued by some that this is impossible while the average taste of the general public is so low. The answer to that is that in the first place the average public gets as good or as bad as it deserves, thanks partly to the failure of those who cater for it to awaken a desire for really better things, but also to the absence of any encouragement of art-appreciation in the curriculum of our national scheme of elementary education. Take the ordinary teaching of history and geography for instance. How many British boys and girls have had their interest awakened in the art productions of the peoples of the past—their own forbears included, or how these, and the culture of those for whom they were produced, improved and broadened accordingly. Surely, even in our lowest grade of schools, no teaching of history is fully profitable which omits to acquaint the children with some knowledge of the best works of art of all time, and the influence they derived from and exercised on the social life of the period? In these days of the cinematograph and other available means of class illustration the children might be interested in and familiarised

with the best and most characteristic examples of the art of every age, and year by year and generation by generation the conviction be enforced that the production of works of real beauty, from the commonest requisites of daily life to the highest, is among the noblest tasks that can occupy an intelligent being.

Even as things are, aptitude selects from the mass such as are naturally gifted with the desire to produce such as far as their capacity will permit. Does anyone believe that our state-aided scheme of art education as it exists to-day is an economical or wise one? Is there any really definite and proper organisation? Is there any attempt, even at the Royal College of Art, to teach or examine in historic design, beyond the study and copying of mere casts and stock forms of decoration? Is there any result therefrom but the spiritless descent to a dull, lifeless, eclecticism, or the freakish self-surrender from time to time to the pernicious influence of some individual or school which sets itself to work to travesty or mechanically reproduce the characteristics of some past phase of art foreign to all our national instincts and necessities. In either case can anything be imagined more certain to kill or distort real originality? Here, surely, if the more advanced student had been competently taught the historic associations of the objects commended to his study, he might have caught the spirit that inspired them, and not have remained content with the dead bones of the civilisations or systems in which they were evolved. As it is, in ignorance or disregard of all the conditions of life which prevailed in the Egyptian palace, the Greek temple, the Medieval castle, the Elizabethan mansion, or amidst the gilt splendours of the salons of royalty and the old noblesse of the ancien régime, we get imitations or adaptations of these structures and of their belongings as germane to our needs as a North American Indian's wigwam would be.

If we are to better all this—if we are to end the reign of mere fashion, and the production of eccentricities which are so ludicrous that they repel the cultured, or yet so mischievous that they debauch public taste—in either case tending to limit a legitimate demand for good work—we have to change all this in some such fashion as we have again and again moulded. First and foremost, by the architect, as by the humblest designer of the common things of daily life, the history and purpose of the buildings and kindred works of past ages and systems must be studied from reproductions or remains, but always in their relation to the social and political life of the time. Then, when the student has grasped in its unity all these associations, he will enter on the study and practice of his own special work, with at

least the desire to understand the needs it is to meet, and to accomplish it without the sacrifice of utility or beauty. It is pleasant to feel that a recognition of this fundamental necessity seems to have inspired the efforts of the First Atelier of architecture as regards our own calling. They will probably be hampered for some time to come by the absence, even in our higher schools, of any such preparatory acquaintance on the part of the scholars with the elementary historical facts about art we want to see accessible to all. It is also satisfactory to admit that, as our recent volumes will bear witness, some of our best living architects have recognised and are more and more recognising the defect in the education of the student and its resulting disastrous effect on his career which we have indicated. In the future, as in the past, we suppose many will still more or less imitatively yield to the fascinations of some particular style; but there is less and less of the dogmatic exaltation thereof common to all critics who are so zealous for the form that they miss the spirit that inspired it.

Analogies are dangerous things; but we venture to suggest that while no great general ever yet neglected the military lessons of the past, no successful one ever tied himself down to the strategy or tactics, which, sound enough in principle, were elaborated to secure victory under the vastly different conditions of ancient warfare. Captains of respectable talents and undoubted courage have ignored that, and suffered defeat, or fought useless battles with a pedantic adherence to system said to have been characteristic of some of our own commanders whose appointments as Generals in Flanders were regarded as life jobs. So we ourselves still build railway stations masked with the exteriors of Greek and Roman temples; within our own memory our brethren the sculptors, even when men's ordinary dress had not degenerated into stove-pipes and tubes, still draped their subjects in togas, and our designers lost themselves in meaningless forms which were commonplace at the best and hideous at the worst. True, now and then the genius of the offender was not altogether to be eclipsed, though shackled by the fetters of bad precedent; but genius is rare, and the dullard prefers the safe road to wealth and reputation, strewn though it is with the skeletons of the sacrifices to the commonplace.

REPORTING ON PUBLIC SERVICE PROPERTIES.

By E. P. ROBERTS.*

The engineer has many opportunities to benefit mankind: by research work, assisting younger engineers, and endeavouring to assist in advancement of all kinds—civic, industrial, sociological, along many of which lines his training makes him especially useful. The paper this evening deals only with his employment by Capital to obtain returns for Capital, and, therefore, values are financial values. The engineer is paid in cash to deliver in cash.

EMPLOYMENT OF ENGINEER ON FINANCIAL BASIS.

Engineers often complain that their compensation is not proportionate to their ability and responsibility. After dinner speakers especially dwell on such points. But engineers are not unique in this respect. From ministers, lawyers, doctors, architects, bankers, manufacturers' associations, trade associations, and other groups, the same complaint is heard: "If it were not for us, where would be our civilisation? We are the great benefactors of the human race; pay us what we consider is in accordance with the benefit

we confer." In a general and broad way, everyone receives for his services in proportion to supply and demand. To such extent as the measure of compensation is financial, each person receives an amount of money based on what the buyer believes he must spend to obtain that which he desires. When Capital employs an engineer, it is on the basis of financial benefit to Capital, and the engineer accepts employment on such basis. If the engineer does not furnish to Capital the best advice obtainable, he is as dishonest as if he does not make every effort to obtain full value from a contractor whose work he supervises. It is the engineer's duty to study each and every question, which either directly or indirectly affects such portion of the problem as is in the engineer's charge, and then to advise the representative of Capital to the best of his ability. If personally he is not able to advise competently, he should obtain such advice and pay for it, or inform his superior officer, or client, that certain questions, or certain phases of some one question, should receive greater attention and investigation than his knowledge or available time will permit. Many engineers have had no training in financial matters, but it is becoming more and more realised that the engineer should have a broad training, including a knowledge of the principles of economics, accountancy, and business law, and should be able to study engineering problems with relation to financial results. There has, possibly, been a feeling that information along financial lines was difficult to obtain, or so intricate, or unscientific in character, that the engineer could not expect, by the expenditure of such effort as practicable, to obtain any knowledge which would be helpful. The engineer appreciates the fact that he must obtain a broad and general engineering knowledge before specialising, and then must specialise before he can make exceptional progress in any line, and concludes that there is no time available in which to obtain knowledge along other lines, or there is no necessity for it, or both. Whatever the reason for such conclusion, it is erroneous and harmful to him and to the profession. If representatives of the legal and engineering professions in any one city are compared, it will be found that more lawyers than engineers are consulted on financial questions. Lawyers receive a broad general training, as do engineers, and then usually specialise. There are always a number of prominent lawyers who are directors in banks, and others are appointed receivers for bankrupt properties. Of course, such receivers are frequently appointed by their professional brethren—in other words, by judges. Frequently, if not usually, executive ability is more important than legal ability; in fact, frequently, legal questions do not represent 10 per cent. of the problem. Without reference, however, to appointment by the Court (acquaintanceship or professional courtesy), probably the average business man would select a lawyer rather than an engineer for such a position, even when the business is a manufacturing or transportation one.

ENGINEERS AS RAILROAD EXECUTIVES.

That frequently engineers are good executives is evidenced by the growing tendency on the part of steam railroads to appoint executives from the engineering force. This is especially interesting in view of the increasing difficulties confronting railroad executives at the present time, as the result of regulation by the Interstate Commerce and Public Service Commissions. In other words, now that the business must be conducted on a basis, Wall street methods, or those frequently considered as such, are no longer permissible.

COMPREHENSIVE ADVICE.

I have already stated that the engineer should have one aim—namely, to obtain dividends for capital; but if he is only able to advise as to the technical design and construction cost, it is evident that his usefulness, and, therefore, the value of his advice, is exceedingly limited. He may be able properly to advise correctly as to the financial

results as between two different classes of structure. An example of such simple character arises when considering the comparative advisability of building a trestle structure or a comparatively permanent bridge. He may be able to report as to the first cost, and proper allowance for maintenance and depreciation of each, and possibly correctly state that, for the case under consideration, the cheaper structure is the preferable one, if considered on the direct basis of cost per year, including interest, maintenance, and depreciation; or that from the standpoint of fire or floods, it may not be advisable. He may properly consider the funds available and financial demands at other points, and state that the erection of a permanent and expensive structure can wisely be left to the future. The above example is a comparatively simple one, though frequently such simple cases are not sufficiently investigated by the engineer. The engineer cannot expect to become an expert lawyer, accountant, economist, or financier; at least, most of us would not be so optimistic. He should, however, appreciate and understand the result of the investigation made by experts along such lines, and the application of such results to the work of the engineer.

CO-OPERATION.

The engineer should also appreciate the fact that it is part of his duty of the engineer to inform other experts as to many facts which often they would not know existed unless he calls the same to their attention, and, in addition, there are many factors the full value and effect of which cannot be ascertained except by co-operative effort. Even in purely technical work the engineer must rely upon others. If he is in charge he should understand the general principles of the methods followed by his assistants, in order to appreciate the value of the result obtained by them, and to take full advantage of their abilities. For example, many of us are no longer able to work out problems in higher mathematics; but if we did not know what could be best accomplished by the application of same, or understand the meaning and comparative value of the answer submitted, we would not instruct someone to make the investigation or calculation; in fact, we might not have such a man in our employ, because we would not feel the need or appreciate his usefulness. To obtain the answer to a technical example is important: that is what we pay the assistant to do. To ascertain the value of the answer and place it in the proper place with relation to all the other factors of the main problem, is what our employer pays us to do.

TECHNICAL SCHOOL TRAINING.

In the past few years more and more attention has been given in technical schools to instructing the students in the fundamental principles of accounting, business procedure, and business law. A leader in such work is your former fellow-townsmen, Dr. A. C. Humphrey, now President of the Stevens Institute of Technology. He, by virtue of his business, in addition to technical training, realised the importance of starting the students along the lines above mentioned, in order that they might, to as great a degree as practicable, not only understand the general principles, but, of more importance, appreciate their bearings upon and relation to the technical work of the engineer. Lectures and examinations on such subjects have been for many years part of the regular work at Stevens. Recently a conference was held at Stevens upon "The Engineer's Part in the Regulation of Public Utilities." The conference was attended not only by alumni and guests, but also by the undergraduates. It was addressed by a number of prominent corporation officials and by a member of a public service commission. It seems to me that many of those present, though especially the students, will become bigger men and more competent and fully-rounded-out engineers, because of the conference; not so much on account of the information conveyed, valuable as it was, but because of the inspiration resulting from

* From a paper read before the Engineers' Club of Philadelphia.

hearing such subjects discussed under conditions especially tending to influence young men.

REPORTS ON PUBLIC SERVICE PROPERTIES.

First.—What is a Public Service or Public Utility Property?

Second.—Why is it constructed?

Evidently the answer to the first question is that a public service property is one constructed to give service to the public. The service may be rendered by the community—municipal ownership—but such is not the ownership of the properties now to be considered, though the same general principles should be applied, including engineering, operation, and accountancy. A public service property is usually considered as one furnishing service to the public, but the ownership of which is private. The peculiar characteristic features are that the owners agree to give adequate service, and the public agrees to give the owners the opportunity to furnish the service. Certain privileges are granted, such as condemnation of properties for right of way, rights in the streets, etc. Frequently, not always, the public permits, or practically assures, a monopoly, either during "good behaviour" or for a specified period. The person who serves is a servant—at least, according to the dictionary; but in fact the duties of the servant are liable to be forgotten. The person served is the employer or "boss." Sometimes the latter term not only seems more personal, but also more applicable. Commissioner C. J. Prouty, of the Interstate Commerce Commission, in address to the Cleveland Chamber of Commerce, January 20 last, on "The Duty of the Public to the Railway," stated: "Now, to go back to my proposition that the railroad is the servant of the public. Assume that you had an intelligent servant, who was especially skilled to do a particular thing, how would you, as a prudent master, treat that servant? You would certainly give him enough to live on, because he couldn't work until he could properly subsist." Mr. Prouty also stated, referring to the railroads, that the servant was at one time the master, and, if I correctly understand his statement, that there is now a tendency to starve the servant and to take away both incentive and ability to give adequate service.

Another way of considering the relationship is that of a special partnership agreement between the public and the public service corporation.

FRANCHISE PERIOD.

Franchises may be short term, perpetual, or indeterminate. Short-term franchises have many defects, perpetual franchises frequently, possibly inherently, do not properly protect the public, or the owner, or both; they are either "wide open" or have unwise restrictions. Indeterminate franchises, sometimes termed indeterminate permits, are permits to control and operate during "good behaviour" on the part of the corporation legally supposed to be "enjoying" the operation, whatever may be the facts as to such enjoyment. It is also often presumed that the owner will be protected from competition because it is in the interest of the public that the utility be a "monopoly," and that if the owner exercises reasonable care in designing, constructing, and operating the utility, that he will be permitted to obtain and retain such form of enjoyment as results from dividends. To an increasing degree it is becoming a fact that public service commissions are not only protecting the public, but also are—or, at least, some are—protecting the owners and instructing the public as to not only what is fair treatment, and also what is in the permanent interest of the public.

FRANCHISE BASIS.

In the issue of January, 1911, of the American Academy of Political and Social Science (Electric Railway issue), the statement is made that the Wisconsin theory is that the franchise is a privilege conferred by the State, and not a contract between the municipality and the company, and that it is subject to State regulation when and as regulation is required. Massachusetts permits

a certain "location," and other States have different angles of approach; but, I believe, that the general tendency is towards control and protection. Control, as to financial scheme and securities issued and as to service; protection, as to avoidance of all forms of special tax, for which the public, or, rather, the users, must pay or not obtain adequate service and protection from competition. An indeterminate franchise is somewhat similar to an indeterminate sentence, as it is also dependent upon "good behaviour." Both indeterminate franchises and indeterminate sentences have good features, though the particular recipient may not always appreciate the application.

The second question is "Why is a public service property constructed?"

The answer might seem to be because of the public need. The correct answer is because someone thought it would pay him. It is the same reason which exists for putting forth any effort. The question always asked is, "Will it be profitable?" In a business transaction the profit is measured in money. There must be a promoter, and this promoter is a most helpful member of the community, though not always for it.

Why is an engineer employed to report on a public service property? Usually in order to inform his client as to whether the property has paid, or will pay, or both, on the investment. The engineer must, or should, be a skilled prophet.

The author then went on to consider the preparation of a report upon a proposed interurban electric railroad, touching briefly upon some special features of reports relative to existing properties and properties other than interurban railroads.

REPORT OF THE DEVELOPMENT COMMISSION.

The Report of the Development Commissioners for the year ended March 31 last was issued on Saturday. It was written before the European crisis and the outbreak of war, and the Commissioners in a footnote added since, say that the immediate demands on the fund will in all probability be largely increased, so that the financial estimate they make will hardly hold good. The total amount guaranteed to the fund up to the end of the financial year 1914-15 was £2,900,000, the whole of which sum has been paid over. Up to the end of March last the Commissioners had actually recommended advances up to £1,493,375, of which £1,216,695 were grants and £276,680 loans. Although from these figures it would appear that £1,629,000 still remains unappropriated; this is fallacious, for some of the grants for education and research will have to be continued annually.

Agriculture and rural industries have absorbed a considerably larger proportion of the fund than any other objects. The expenditure hitherto sanctioned is £921,549. During the current year some £400,000 more may be required for the continuance of schemes of research, technical advice, and instruction already set on foot, buildings and farms for agricultural colleges, further provision for research in veterinary science, the continuance of existing schemes for the improvement of live-stock breeding, and the promotion of co-operation. These demands may reach £1,100,000. The total amount hitherto recommended for forestry and afforestation is £142,749, of which rather more than £80,000 has been advanced by way of loan. But large demands must be anticipated during the next two years, as the schemes sanctioned include a Scotch demonstration area, the acquisition of one or more experimental areas in England and Wales, afforestation schemes for land already purchased in Ireland, and loans to local authorities for the afforestation of water catchment areas. It is necessary to reserve, conjecturally, another £200,000 for these purposes up to 1916. The advances sanctioned for harbours amount to £710,995, of which £117,600 has been advanced by way of loan. Several large schemes already accepted in principle are under consideration or im-

pending. For inland navigation £29,500 has hitherto been lent, and it is anticipated that £150,000 may be sufficient up to 1916.

The total amount conditionally promised is £2,250,000, and this does not include any provision for future assistance in the reclamation and drainage of land or the improvement of rural transport. The Commissioners, therefore, have no alternative but to repeat their previous warning—that it will be necessary shortly to abandon or cut down several of the most beneficial schemes assisted from the Fund unless Parliament comes to its assistance. The Commissioners are bound to state the facts, with the desire that all concerned should appreciate the situation some time before it becomes practically urgent.

THE SCIENCE OF LIGHTING.*

By W. S. LOYD.

It was an early June morning when real red-breasted robins were piping their matins in the tree-tops which stretched their heads from the valley below to the casements of the windows before which we sat in the laboratory of a great lamp-making establishment discussing lights and colours, sunbeams and the spectrum, especially as the question of light applied to the modern home, the picture gallery, and the art museum.

He was M. Luckiesh, Light Expert Extraordinary, I should say, at the National Electric Lamp Association, Cleveland, Ohio, author of brochures on "Light and Art," "The Influence of Coloured Surroundings on the Colour of the Useful Light," and many other interesting topics.

NEW ERA OF COLOUR.

"We are on the threshold of a new era in colour usage," Mr. Luckiesh declared with enthusiasm. Everything points to this demand for a wider, bolder use of brilliant hues for the very sake of colour alone.

"The day of colourless architecture I believe is on the wane, as the increased demand for tile and terracotta indicate. The widespread use of vivid colouring in feminine attire has a natural cause in our love for beautiful effects in clothing. The eye refreshes itself in bright effects as our delight in sunsets, in autumn foliage, in the rainbow, in tropical plumage and verdure testify.

"But this is all out-of-door lighting," I venture. "How should the light of the sun and sky be reproduced in our homes and picture galleries.

"That is indeed a question, for the proper lighting of a work of art should be the final touch to complete the picture, for the artist evidently had in mind a certain definite mood which he intended to convey on his canvas. If this mood is destroyed by the influence of colour surrounding his picture, or the colour of the light thrown upon it, he might as well have never painted it. As I have said, the lighting of a work of art should add the final touches. By varying the direction, quality, and quantitative distribution of light many effects, pleasant and unpleasant, can be produced. Therefore the lighting should be the result of the same thoughtful study as characterised the use of the chisel or brush during the evolution of the product of the sculptor or painter. Light has been termed 'the soul of art,' but oddly enough artists have given the illuminating engineer little data to assist him in the æsthetic field. It is strangely true that artists have often shown an antipathy to science, and this in spite of the fact that the problems they must face often require for their solution an accurate knowledge of many laws of light and vision. This makes it necessary for the lighting expert to call on his own resources, which, if lacking, must be developed.

"And let me say right here that most illuminating engineers are empiricists. I do not care where you find them, they are always talking and thinking in such unemotional terms as watts per square foot and efficiency. They go around a room with their eyes on

* From the "Ohio Architect."

the floor measuring the square feet in order to arrive at some mathematical solution for lighting a wall they have never looked upon. This is no doubt due to the fact that a great deal of lighting can be done in this empirical manner. But much of it cannot. Before the lighting expert can enter the domain of art lighting, however, he must be prepared to look with the artist out of 'the eyes of his soul' and learn to think in emotional terms. Art cannot be manufactured, and art-lighting will not be successful when applied by 'rule of thumb.'

EFFECT OF LIGHT MOST IMPORTANT.

"The effect of any light upon an object is obviously our means of visualising it; but the importance of the direction, quality, and distribution of light upon an object is but little understood or appreciated. Progress in the art and science of illumination can be made, therefore, mainly by studying the means of varying these factors and the effects obtained. Light and shade or the distribution of brightness over the surface of an object depends upon the direction of the light rays, or the quantitative distribution of the light flux. Colour in the fabrics you buy at the stores, or even the Corot or Turner which you see at the galleries, depends largely upon the quality or colour value of light falling on the object.

"In other words the effect transmitted to the beholder is not wholly inherent in an object itself. It depends to a remarkable degree upon its environment. When we go down to the laboratory I will show you how wide a range of colour a single object may assume under the least variation of the light. We will see that fabrics cannot only be made to assume many tints by varying the quality of the light, but even by varying the colour and brightness of their surroundings.

"The main object of artificial lighting is, of course, to prolong the daylight, and if you will permit me to differentiate between sunlight and daylight I can assure you that we have already produced an artificial sunlight which is scientific not guesswork sunlight. I mean by that that its analysis under the spectrum is true sunlight. It required many years of experiment to produce a Mazda lamp that would do this; but I will show it to you in a moment."

Proceeding into one of the laboratories Mr. Luckiesh pointed out a large glass globe of a peculiar bluish tint, having apparently another globe within containing the lamp filament, and, turning on the light produced a light as colourless as the direct rays of the sun on a field of snow.

"But sunlight, you see," Mr. Luckiesh at once proceeded to explain, "is a very different thing from daylight. Daylight ranges all the way from sunlight to blue sky. It is 80 per cent. direct sunlight and 20 per cent. reflected skylight, that is, indirect or diffuse light. So we have all sorts of grades of daylight. For that reason this glass is modified to produce any phase of daylight from late afternoon to blue sky.

IMITATING DAYLIGHT.

"Daylight is so commonly demanded in stores and factories that we need, either cloth fabrics, dry goods or to know them, wallpaper, paints, and so on, where exact gradations of sunlight are required. It is also required in the home, in the mill, lithographing shop, and in factories, sugar refineries, and art galleries, in a very wide range of buildings, as you see."

"For general store lighting a light of a colour midway between artificial light and sunlight seems advisable."

"For industrial processes and art galleries, where accurate colour matching is required, a general light of the colour of sunlight is obtained."

The glasses of the very highest efficiency possible for obtaining the desired effect, and has been brought to this stage of perfection by long research. It is the best work in man's effort to become independent of daylight, and I am giving you the first view of it, for the lamp you see now has not even been catalogued yet."

"But we were discussing the position of lights on pictures; in our homes and galleries," I ventured.

"So we were, and I would like therefore to say something about effect of direction and quality of light upon those departments of the fine arts as are represented by form or space. I refer to sculpture, architecture, and painting.

LIGHTING WORKS OF ART.

"Sculpture has been defined as modeling or shaping art whose function it is to express and arouse emotion by imitation of natural objects and principally the human body in solid form, reproducing either true proportions in three dimensions, or their proportions in two dimensions of length and breadth only with a diminished proportion in the third dimension of depth or thickness.

"Solid modelling and real light and shade are special means which the sculptor alone among the imitative artists enjoys. Single outlines are the means which the sculptor enjoys in common with painter, and when we consider work executed in very low relief it is evident that the principle of such work is not the principle of sculpture at all. Its effect does not depend on qualities of surface light and shadow, but rather on qualities of contour as traced by a shadow on the side away from the light source and a line of light next to it. Bas-relief approaches the graphic art or painting—the third dimension is very short of its true proportion.

"In truly three-dimensional sculpture lights and shadows within the boundary lines are quite essential. This means there must be directed light on this class of art production. The directed light may come from a small or large source, depending on the effect desired. Likewise the direction is of importance. Let us take this head, said he, pointing to the father in the Laocoon group. In this case the expression should be one of intense pain or terror, most readily shown by bold, sharp shadows from point sources properly placed. All the point sources shown in these photographs were about 20 in. in front of the vertical plane on which the object was hung, as we will see for ourselves when I shall reproduce the object for you in the laboratory."

This Mr. Luckiesh proceeded to do. First the lights were flashed on the cast from above, and this is the light one generally gets upon the original in the Vatican and upon the plaster reproductions in most of the art museums, for he is compelled to look upward at the group against the light which comes in from above. The expression thus you will see is far from expressing the pain and terror expected. Extinguish these high lights and turn the light on from beneath, reversing the shadows, and the effect is startling. Even with alternate side illumination the change in the expression is more than would be expected.

LIGHTS AND SHADOWS.

"One of the high authorities, Flaxman"; Mr. Luckiesh went on to say, "tells us concerning the quantity of light and shadow in a group that if the light be one-third and the shadow two-thirds the effect will be bold. If the light be one-fifth and the shadow four-fifths it will be still bolder and accord with the tragic or terrific action; but the more general effect of sculpture is two-thirds of the light on the middle of the group, with a small proportion of very dark shadow in the deep hollows.

"This rather vague statement is the most definite I have found expressed by art students on the subject of light and shade, in sculpture. According to it there should be considerable shadow both in the above group and the architectural capital I am about to show you.

It is already evident that a preponderance of badly diffused light is undesirable in sculpture. However, a certain amount of diffused light combined with a preponderance of directed light is necessary in attaining the most desirable illumination and with the head lighted as in the last figure, only 3 or 4 per cent. of the total light need be directed

on the dark side towards the dark side to greatly enhance the value of the result.

"In the illustration of a Saint Cecilia head were shown some effects upon a very low relief of pure white.

LIGHTING AND ARCHITECTURE.

"The direction and quantitative distribution of light also affects the appearance of architectural designs. A moulding or capital will change wonderfully in appearance when the position of the light is varied, and diffused light to obliterate detail is obviated by the application of a final tinted coating, which remains more thickly in the deeper recesses, thus simulating shadow.

"The function of architecture is to express and arouse emotion by combinations of ordered and decorated mass. Here the direction of the incident light is of less importance than in purely sculptural art, although it is safe to abstain from the use of too much diffusion of the light. The use of a tinted surface-coat will also in this case tend to mitigate the evil of too much diffusion of the incident light. The appearance of a moulding, when lighted from various directions, is also striking.

PAINTING.

"So far the effect of the quality of light has not been considered. This has been reserved for treatment while considering the subject of painting. Purely conventional decorative painting is not affected by the direction of the incident light, but the quality of colour-value of the light is of importance. There has been so much written on the colour-distortions produced by various illuminants that no one would think of illuminating decorative painting with light sources so poverty-stricken in various spectral regions as the mercury-vapour lamp. Under most artificial illuminants the colours simply shift further toward red than when illuminated by daylight. That is, a deep yellow would appear as orange, a bluish purple would change to a reddish purple, and a blue would appear black, while a red would appear brighter. In purely conventional decorative painting these shifts are not usually dangerous. It should be remembered, however, that colours have no definite or fixed existence of their own, once they are out of the tube, because they are so influenced by their surroundings and so affected by the quality of the light which illuminates them. In this class of decoration apparent variations in light and shade have been produced by augmenting certain colours by directing a certain amount of properly coloured light upon them. It is evident that enriched coloured effects likewise can be thus obtained.

MURAL PAINTING.

"Mural painting occupies a position midway between purely conventional decorative painting and the realistic easel picture. It must be so real that it tells its story, but not so real as to destroy the flatness or solidity of the surface. It is an adjunct to architecture, and, as such, it is the applied art of painting, in the highest sense of the term. It becomes of interest to the illuminating engineer because it is peculiarly dependent upon its surroundings. The mural painter must not only consider the form and position of the space which the painting will occupy, but he has not availed himself of all the possibilities if he fails to consider the colour of the surrounding walls and the quantity, quality, and direction of the light which it will receive. But suppose the mural painter has recognised all these things and has completed his work. To what avail are his plans if the illuminating engineer enters later, remodels the system of lighting according to empirical rules, paying attention to watts divided by areas instead of direction and quality of light? That is one place where empiricism will not succeed, unless by accident.

"In the easel picture the art of painting reaches its highest development. Here direction, quantity, and quality of light play very important parts in the final expression of the work. Badly-illuminated paintings are

so common that all of us can recall many cases. It is true that paintings are well illuminated with difficulty. Much diffused light eliminates the undesirable results of glare, due to specular reflection.

"But there is another side worthy of consideration. Experiments indicate that each picture is most satisfactorily illuminated by a direction and quality of light specially adapted to it. Perhaps the artist has produced his work in diffused daylight incident from above. He has chosen his values of light and shade, likewise his colours, and is satisfied with the completed picture. But perhaps the purchaser has other ideas. It is very evident from these experiments that a painting can be made to various expressions by varying the direction and quality of the light.

"Art museums," Mr. Luckiesh concluded, "are usually badly lighted, since there is one general light for pictures painted under various light conditions, all different from that under which they are finally viewed. Each picture should have its own specially treated light, in order that, as nearly as possible, it may be seen under the daylight conditions of its original production. The lighting artist is able to create these conditions. He is also able to supplement for the painter the limitations imposed upon the latter by his pigments, while the benefit he is able to confer upon the owners of dimmed old canvases, transformable into luminous masterpieces, is incalculable."

PAINT ON CEMENT OR CONCRETE SURFACES.

A paper on "Paint Protection for Portland Cement Surfaces," by H. A. Gardner, Washington, D.C., has for its object the determination of what constitutes a suitable paint for the protection and decoration of exterior and interior stucco walls constructed of Portland cement, and for decorating and rendering wearproof Portland-cement floors. In April, 1912, Mr. Gardner instituted in Washington a series of tests to determine the durability of various types of paint upon Portland-cement surfaces exposed to the weather. The panels for the tests were prepared by constructing a long board wall to which was fastened expanded metal. A mixture of 1 part of Portland cement and 2 parts of clean Potomac River sand was made and applied to the expanded metal, forming a cement wall 3in. in depth. The wall was divided into 35 sections or panels, each 30in. wide and 40in. high. Three coats of paint were applied to each panel by a practical journeyman painter. In order to make the test more severe, nearly all of the paints were applied in white. (Tinted paints are known to be much more durable than white paints.) A strip of chrome green, 6in. wide, was placed over the top of the third coat of paint, in order to determine whether or not the lime which might be present on the surface of the cement would have any effect upon the paint coating. Fading of the green to a yellow would indicate such action. A priming coat of 25 per cent. zinc sulphate solution was applied to the panels, to neutralise any free lime; but this is held to be unnecessary if the surface is dry when painted and if it will not be exposed to the weather.

The tests showed that the amount of free lime in fairly dry cement surfaces does not adversely affect high-grade oil paints. The tests also showed that zinc sulphate may be used with excellent results as a primer to neutralise free lime in damp cement surfaces which are to be painted. Opaque white pigments, such as basic-sulphate white-lead, basic-carbonate white-lead, zinc oxide, and lithopone, were present in the paints which gave the best results. In some of these paints there was present a percentage of inert pigments, such as barytes, astbestine, whiting, china clay, gypsum, and silica. The sealing of varnish paints, which developed in several tests, apparently showed that resinous paints are not well suited for cement surfaces.

The oil paint is not attacked by the dry cement, and holds both texture and colour. Equally satisfactory results were obtained with boiled linseed oil, mixtures of raw and boiled oil, and mixtures with Chinese wood oil. Such simple paint coatings were also found to be excellent for concrete floors, being durable, wear-resisting, and dust-preventive. The results of these tests are quite in line with the results obtained by Ware and Schott in a series of paint-exposure tests made upon exterior concrete surfaces. They also agree with previous long-time exposure tests made by the author.

As a result, therefore, it can be stated that excellent results may be obtained by treating cement walls or floors with paints made with raw and heat-treated linseed and Chinese wood oil, containing durable, wear-resisting pigments. When the cement surface is freshly laid and damp, such paints may be safely applied, after treating the cement with a zinc sulphate primer. The general results of the tests at the end of a two-year period, together with an outline of the composition of the paints tested, is given as follows:—

Class No. 1.—Single-segment paints made with white-lead or zinc oxide ground in pure linseed oil. (These paints are in very good condition throughout.)

Class No. 2.—Combination-pigment paints made of mixtures of white-lead, zinc oxide, or similar pigments ground in pure linseed oil. (These paints are in generally excellent condition.)

Class No. 3.—Combination-pigment paints ground with mixtures of raw and heavy-bodied linseed oil or with treated Chinese wood oil. The viscosity of these oils requires the use of considerable turpentine or other thinner in the manufacture of such paints, in order to make them of the right viscosity for application. Semi-flat surfaces are therefore produced during the drying. (Most of added are in somewhat better condition.)

Class No. 4.—Single and combination pigments ground in oil varnishes containing acid resins. (These paints are checking and sealing in many spots. Such varnish paints are apparently not suited to exterior exposure.)

Class No. 5.—Paints containing resins dissolved in volatile spirits (spirit varnishes) with or without pigments. (These paints are not giving very satisfactory service, the clear varnishes having entirely decayed in some cases. Those to which pigment has been added are in somewhat better condition.)

Class No. 6.—Paints made with single and combination pigments ground in a water medium containing glue or casein as a binder. (These paints are chalking rapidly and are not moisture-proofing the cement. The pigment binder has been destroyed by the weather.)

Mr. J. H. Tunmer, a former headmaster of the Southampton School of Art, has passed away, aged 74, at Colombes, in France, to which country he went on resigning his position.

The Road Board have promised to defray half the cost of the construction of a road from Port Talbot into the Glynecorrwg district. This work will be undertaken by the Margam and Glynecorrwg Urban District Councils at an estimated cost of over £24,000.

The rural district council of Pebworth have received the sanction of the Local Government Board to a loan of £2,275 for a housing scheme to be carried out in the village of Cow Honeybourne, and the clerk has been instructed to complete the purchase of the land.

In the grounds of the Glebe House, Little Hornead, near Buntingford, is an ancient tithe-barn, 110ft. long by 26ft. broad; it is constructed of timber, and has a thatched roof. This has been converted into a Roman Catholic chapel and presbytery. The character of the old building has been preserved as much as possible; the roof posts and timbers have been left, the old wood work strengthened, and one or two windows added. The old chalk floor has been levelled, covered with concrete, and boarded. English oak has been used for woodwork. The building is lighted by electricity, and heated by hot water. The altar in the chapel is of Bath stone, and the confessional is of oak. On the wall behind the altar is a carved wooden crucifix.

OBITUARY.

The death took place on Saturday of Mr. James Moffat, J.P., of Cressingham, Sparkbrook, Birmingham, a member of the firm of James Moffat and Son, builders, Camp Hill. He was eighty-one years of age. Mr. Moffat was the founder of the firm which built the Camp Hill Grammar Schools, and many of the business premises about the centre of the city and the large Edgbaston residences. In 1906 he was made a magistrate of the city of Birmingham, and was one of the most regular attendants on the bench. For many years he filled the position of bailiff of the St. John's foundation, Deritend, and took a leading part in the reconstruction of the charities about thirty years ago. A Liberal Unionist, he unsuccessfully contested the Bordesley Division for a seat on the City Council some years ago. He leaves two sons and two daughters.

CHIPS.

Mr. C. K. Henderson, of Westbury, has been appointed surveyor to the Pewsey Rural District Council.

A new church in Norton Way, Letchworth Garden City, has been formally opened. It has been built at a cost of over £5,000.

The Local Government Board have sanctioned the application of the urban district of Llandudno for leave to borrow £13,195 for the provision of golf-links, and £4,855 for a housing scheme.

The urban district council of Buxton have decided to rebuild the natural baths during the coming winter at a cost of £15,000. St. Anne's Well and the hot-baths establishment have just been rebuilt.

The corporation of Newcastle-on-Tyne are about to carry out the widening of the North-road between Clayton-road and the city boundary at Gosforth. It will cost about £15,710, towards which the Road Board will contribute £5,000.

The Rochdale Town Council, in committee on Thursday last week, approved an agreement with a Bradford firm for installing at the Roch Mills sewage works a new plant for the treatment of sewage sludge.

The drill hall which is being erected at Winnipeg for the Dominion Government, at a cost of 500,000dol., has reached the roofing stage. The general contractors are Messrs. Carter-Halls and Aldinger, of Winnipeg.

The urban district council of Stroud have decided to apply to the Local Government Board for consent to borrow £500 for the purchase of 2½ acres of land on the outskirts of the town on which to erect workmen's cottages.

The thirty-ninth annual report of the Public Works Loan Board states that the Commissioners during the financial year 1913-14 made 1,982 advances for sums amounting together to £4,610,733, as compared with 1,712 advances for £4,554,683 in 1912-13.

A faculty was granted on Tuesday in the York Consistory Court to the Vicar of Selby to erect a marble, alabaster and mosaic tablet in the north transept of Selby Abbey to the memory of Mr. William Littlewood, who died on December 22, 1913.

The modern cross at Banbury, built in 1859 on the site of the Mediæval structure, has been "completed" by filling three empty niches with statues of Queen Victoria, King Edward VII., and King George V., in commemoration of King George's coronation.

Foundation work on the Earncliffe Apartments has been started at Toronto. The new building, which is estimated to cost 500,000 dollars, will be eight stories high, of steel and brick construction. The architect is Mr. N. G. Beggs, and the general contractors are Messrs. Deeth and Son Toronto.

The War Office are about to acquire land at Burdop, near Swindon, for the erection of barracks. The site is a part of South Farm, a mile on the Gizebourne side of the village of Chiseldon, for the buildings, with a quantity of other land for training, the whole being about 30 acres. The nearest station is Chiseldon.

The corporation of Wigan have decided to apply to the Local Government Board for sanction to borrow £27,185 for building 138 workmen's dwellings in Malverley-street and for the construction of the streets in connection with the scheme. The plans have been prepared by the borough engineer, Mr. A. T. Gooseman.

Currente Calamo.

As will be seen elsewhere, the Government has promptly acknowledged the patriotic offer of the Architects' War Committee on behalf of the whole profession to help in this national emergency in any direction which may be found practicable and desirable. We trust opportunities will not be lacking, and are sure that they will be embraced with eagerness. We also take the opportunity of congratulating all our readers—and they are many—who have individually found themselves able to join the King's forces, and so render the best service possible at the moment. From the ordinary members of the profession and their brethren in the service of the municipalities and kindred authorities the response has been most creditable, and we rejoice at it, and wish every recruit good luck and every chance of proving to the braggarts in Germany that devotion to art and genuine culture—not the varnish which thinly hides the native brutality of the butchers and torturers of unarmed non-combatants and the wreckers of the monuments of Louvain and Malines—is among the best guarantees of the true patriotism that readily responds to the call of a free nation, but is not to be coerced into the ranks of slavish militarism.

Creditors in the Building Trades should make a note of some remarks of the Inspector-General in Bankruptcy in his recent Report for the year 1913. For in a few lines he indicates some effects of the new Bankruptcy Act, which has been in operation since April 1 last. Under the former system a common trick of the accountant or solicitor advising an insolvent debtor was to get his execution of a deed appointing a trustee and assigning all his assets to the accountant as trustee. With this deed done, a meeting of the creditors was called, and they were then faced with the dilemma of either accepting the position and allowing the deed to be worked out, practically on the debtor's own terms, or going to the trouble, expense, and risk of making him bankrupt. But since April 1 this sort of bandit way of doing business has been checked. Under the new Act a deed of arrangement or assignment has no sort of validity unless and until it is assented to by a majority both in number and value of the creditors concerned. In future, therefore, a deed of assignment executed only by the debtor and a trustee, with perhaps one or two creditors, is of no value, and cannot be presented as a pistol at the head of a meeting of creditors. The effect of the said Act during its four months' working to the end of June has already been to reduce the weekly average of fifty such deeds to some thirty-three, and when the existing law is better known there will be a still greater fall in these totals.

Architects and surveyors will do well to ask companies in which they insure fire risks how much of the amount is re-insured in German offices. The *Globe* last Monday stated that at least four millions per annum is paid to German companies, nineteen of whom it names, which have branch offices in London. There are plenty of British and Colonial companies ready to take these risks, and fire insurers should very seriously ask themselves whether property nominally covered by British offices, but really re-

insured—the *Globe* says to the extent of four-fifths—in German companies, is safe, after our recent experiences of German perfidy and the value attached to "scraps of paper." We suggest that at once every policy-holder should ask the company he is assured in if, and to what extent, his policy is covered by German offices, and if he gets an evasive answer, or anything short of a definite assurance that not a farthing is so remitted, that he should promptly transfer the policy to another office. British companies, moreover, which do not thus shift their liabilities on to German shoulders should promptly make it known. Some of them already, we fancy, must be asking themselves what the guarantee is just now that a single penny of any loss would have been paid by any German or Austrian office.

By the way, auctioneers and others—some "architects" do it—who add insurance agency to their ordinary business will do well to notice that it is a criminal offence at the present time to make people's flesh creep with the view of screwing proposals out of them. A case which excited a great deal of public interest in the neighbourhood was heard at Harwich Police-court on Tuesday. Herbert Booth, auctioneer and estate agent, Dovercourt, was summoned for dispersing certain printed leaflets without the printer's name and address, and Albert Edward Byles, Dovercourt, was summoned for printing the leaflets without adding his name and address. The leaflet purported to contain an extract from "Lloyd's" letter, dated August 22, 1914, opening with a reference to insurance rates for business premises, private houses, furniture, etc., and it continued: "We think it will be apparent that rates are bound to go up, in view of the indisputable advance of the Germans in Belgium, and we know people will be well advised to insure at present rates immediately." Another passage ran: "The news we have is doubtless two or three days old, and in all probability the enemy is even now occupying Belgian ports, with a view to bringing her fleet through the Kiel Canal down to the said ports, which would aid her, and, in fact, render practicable what appears to be her purpose—viz., a blow at this country covered by a feint at France."—Counsel said it was well it should be known that it was a criminal offence of the most serious character at the present time for any person to spread reports likely to cause alarm among the civil population. Mr. Booth said the circular was not the wording of his firm, but was an exact copy of a letter received from Lloyd's.—Mr. Humphreys observed that it was absolutely untrue to say that the corporation of Lloyd's had issued such a statement. He had evidence he could call on that point if necessary.—Mr. Booth said it was a copy of a letter received from Lloyd's or a member of Lloyd's.—The other defendant pleaded that the work was executed in a hurry, and he was not in sympathy with the statements contained in the circular. He acted quite innocently in the matter. The Bench fined Byles £1 and costs and Booth four guineas and costs.

Mr. J. G. Koppel, Superintendent of Bridges at Sault Ste. Marie, Ontario, Canada, describes in "Railway and Locomotive Engineering," a clever bridge repair, which may be found noteworthy in connection with other structures. A crack

developed in the foundation of the bridge crossing the ship canal at Soo, Ontario, as shown, which amounted to fifteen-sixteenths of an inch. A $\frac{1}{2}$ in. steel plate was made in three sections, and drilled to fit on the jack-shoe bolts, and one jack-shoe at a time was removed and the plate laid in place and the jack-shoe replaced. When both plates were secured in position, then the centre-plate was put in and the bolts screwed down, and

when all were in tension the masonry was drawn into its original position, while a mixture of cement was poured into the crack, which made a very good job, as the foundation is now apparently as good as could be desired, and safer than the original structure, as nothing short of an earthquake could move the steel plate that was added to the structure. Not only so, but it is evident at a glance that a new idea has been added to structures of this kind. Masonry under direct vertical pressure is always reliable, but under slightly horizontal pressure of an intermittent kind, such as is caused by the oscillation of a heavy locomotive and attached train rounding a curve, the tendency of the masonry to crack or dislocate is very great, and a reinforcing plate should be used.

All our readers, who, with ourselves, have been many times indebted to his kindly readiness to give information, or furnish us with illustrations, will regret to learn that Mr. W. T. Oldrieve, Principal Architect for Scotland to H.M. Office of Works, has retired. An able architect and a discriminating but zealous archaeologist, he has rendered yeoman's service to Scottish art for many years. His restoration of the roof of Glasgow Cathedral, which we fully illustrated at the time, was a triumph of its kind, and was effected at the remarkably low cost of £14,000. His discovery of David's Tower at Edinburgh Castle has been described as "the most interesting thing that has occurred at the Castle since the discovery of St. Margaret's Chapel fifty or sixty years ago by Daniel Wilson." Other parts of the Castle have enjoyed new stability as a result of his labours, while Holyrood Palace, together with the Chapel Royal, has been given a new constitution, so that, as Mr. Moir Bryce recently remarked, its walls will stand for centuries to come. Stirling Castle, St. Andrew's Cathedral and Castle, Elgin Cathedral, Dunfermline Abbey, Arbroath Abbey, and Newark Castle were among the many historic buildings which have come under his care. Mr. Oldrieve was educated at Mansfield Grammar School, and in 1885-6 attended the architectural section of the Fine Art Class at Edinburgh University, gaining a class medal and the Cousin Prize. In 1886 he won the Godwin Bursary of the Royal Institute of British Architects and spent a considerable period in a sketching tour on the Continent. He had already gained first place in 1881 in the open competition examination as assistant architect and surveyor in H.M. Office of Works, and in 1890 was appointed official architect at H.M.

Office of Works, London, for provincial post-offices in England and Wales. It was in 1904 that he was promoted to the position in Edinburgh which he is now resigning. He was appointed a member of the Royal Commission on the Ancient Monuments of Scotland at its formation in 1908. In 1912 he was elected a vice president of the Society of Antiquaries of Scotland, and an hon. B.S.A. this year. Since his appointment as head of H.M. Office of Works in Scotland he has carried out many new works of architectural importance, including Glasgow new Parcel Post and Telephone building, costing £75,000; Kilmarnock new post-office, £11,000; Lerwick new post-office, £9,000; Oban new post-office, £8,000; Edinburgh General Post Office extensions, £66,000; Glasgow Head Post Office extensions (not quite completed), £70,000; Telephone Exchange buildings, Glasgow and Edinburgh, £27,000; Eskdalemuir Magnetic Observatory, £24,000; Edinburgh Royal Scottish Museum extension (in progress), £50,000; Royal Scottish Academy reconstruction, £18,000; National Gallery reconstruction, £9,000; Edinburgh Courts of Law extension and alteration, £24,000; and Labour Exchanges for Glasgow, Edinburgh, and Dundee, £33,000. It was Mr. Oldrieve's intention to visit New Zealand immediately after his retirement, and to return to Edinburgh after six months' absence and undertake practice as an architect and surveyor, owing, however, to the war, this tour has been in the meantime abandoned.

Birmingham will be sorry to learn that the family intend to sever their connection with the house at Highbury which the late Mr. Joseph Chamberlain built for himself and dwelt in during the last thirty-four years of his life. Up to 1880 Mr. Chamberlain resided in Augustus-road, but in 1879 he acquired about seventy acres of land at Moor Green, and there he built Highbury—so named after his old home in London. It was designed by Mr. Chamberlain's friend, the late Mr. John Henry Chamberlain, and the grounds were laid out by Mr. Milner, an expert landscape gardener, who had also arranged the gardens at Southbourne, in Augustus-road, Mr. Chamberlain's home during his mayoralty. The house is thickly covered with ivy and other creepers. The garden slopes to the valley below, and most of the windows face south and west. The entrance-hall and Mr. Chamberlain's library are perhaps the two most interesting features of the house. The library is fitted with the fine-oak ceiling and panelling designed by the architect; but the ample shelving long ago was found insufficient for the innumerable books, which for many years past have overflowed into other rooms. In the gallery above the hall, out of which most of the rooms open, are hung two portraits—one of Mrs. Chamberlain, by Millais, and the other of Mr. Chamberlain, by Sargent.

Exporters of cement to Australia will not welcome the announcement that Portland cement is now being made at Darra, ten miles from Brisbane, on the southern main line of the railway. About 14,000 to 15,000 tons of coal will be consumed in the manufacture of 30,000 tons of cement (this being the suggested present capacity of the works). The consumption of Queensland cement during 1913 was 36,000 tons. The wholesale net price of cement on wharf in Brisbane is 74s. 8d. per ton; the lowest price during the

past year was 68s. 3d. The cost of the company's cement delivered in Brisbane is estimated at 40s. 1d. The whole of the Portland cement consumed in Queensland is imported, about 10 per cent. of the total from Europe and the remainder from New South Wales, Victoria, and New Zealand. The demand for cement for constructive works of all kinds is increasing so rapidly in Australia that there is frequently a shortage of supplies, and as all facilities for its manufacture are to be found in close proximity to Brisbane, and there is the protection of a high tariff and substantial freights, the establishment of the industry in Queensland shows great promise.

The Caxton Publishing Co., Ltd., Clun House, Surrey-street, Strand, W.C., issue Section Four of "Home Interiors," by R. Goulburn Lovell, at 15s. The work is in every way equal to the previous excellent Sections, which we have already recommended to all designers and decorators. It includes coloured drawings and full working instructions for the decoration of a grey and blue hall living-room, and a green and purple splat bedroom, with decorative scheme and window scheme for both, in fac-similar water-colour, and half-full-size details of both.

The Hackney Borough Council has been authorised to borrow £15,750 for the extension of its electricity-generating plant.

The corporation of Croydon are applying to the Board of Trade for sanction to construct a double tram-track from Selhurst Station to Princess-road at a cost of £2,550.

Mr. H. Holmes, M.Inst.C.E.I., borough engineer of Ossett, has been called in by the Elland Urban District Council to report on future extensions at the sewage-disposal works.

The urban council of Portrush have under consideration plans prepared by Messrs. Henry and Clarke for a proposed town technical school and public baths estimated to cost over £17,200.

The town council of Torrington have received the sanction of the Local Government Board to a loan of £11,000 for the housing scheme. In view of the war, it was deemed advisable to postpone inviting tenders for at least a month.

Mr. H. C. Phillips, of Eastleigh, surveyor and sanitary inspector to the Hursley Rural District Council for the past four years, has been appointed to a similar position under the Mere Rural District Council at a salary of £160 a year.

Mr. Alister H. Forbes, for the past five years factor of Rothesay for the Bute estates of the Marquis of Bute, has been appointed land agent at Cardiff on the Bute estates in South Wales—a post previously held, in conjunction with other appointments, by the late Lord Merthyr, better known as Sir Wm. Lewis.

The Glasgow Corporation sewage committee recommend the preparation of the specification, schedule, and plans for the construction of the sludge-main outside of the Dalmarnock and Shieldhall Works, and the carrying out of the excavations necessary for the third section of the filter-beds. The estimated cost of this section amounts to £33,000.

A large number of the members of the engineering profession having expressed the wish to be allowed to serve their country together in one regiment or battalion, the Institutions of Civil, Electrical, and Mechanical Engineers have under consideration the formation and training of a battalion enlisted from among their members, with a view to its forming part of Lord Kitchener's Army.

Lady Boston, as president of the Welsh Housing Association, accompanied by Lord Boston, Mr. E. T. John, M.P., and Mrs. John, inspected a number of dwellings erected at Carnarvon, under the auspices of the association. Her ladyship also visited some of the slums of the town, and expressed the view that Carnarvon afforded opportunity for further efforts on the part of the association. The party was conducted through the premises by Mr. St. John Hancock, architect to the association.

PROFESSIONAL AND TRADE SOCIETIES.

BRISTOL SOCIETY OF ANTIQUARIES.

—The third excursion of the season was undertaken on Saturday last by members and friends of the Bristol Society of Antiquaries. The destination was the Pensford, Publow, and Stanton Drew district. The churches of Pensford and Publow were inspected. The former, dedicated to St. Thomas of Canterbury, dates back to the 14th century. The font is now the only surviving feature of that period except the tower. During a severe inundation in 1889 the interior of the church was 4ft. under water. Publow church of All Saints' is famous for its fine "Somerset" tower. Inside is a pulpit of carved oak made out of old pews. The party next proceeded to Stanton Drew, noticing on the way a huge recumbent mass of sandstone known as Hautville's Quoit. At Stanton Drew the Rev. A. W. Woolverton acted as guide on a visit to the fine parish church. Mr. Woolverton pointed out the interesting features thereof, including the font, which belongs to the Early Norman period, the lower part of the tower (13th or 14th century), the bosses on the roof (Carolyan or Jacobean), the 15th-century doorway of the porch, and the apparent signs of a 13th-century window in the north wall of the old chancel. The Rev. A. W. Woolverton then directed attention to the famous huge stones, which are in the immediate vicinity of the church. He quoted Dr. Lloyd Morgan as being of opinion that the stones were erected by the Celtic bronze folk (Belgæ), or more probably their Neolithic precursors. It is commonly believed that the stones were erected for astronomical purposes.

ROYAL ARCHITECTURAL INSTITUTE OF CANADA.

—The Royal Architectural Institute of Canada will hold their seventh general annual assembly at Quebec next Monday and Tuesday. At the inaugural session addresses by the Mayor of Quebec, the President of the Quebec Section of the Province of Quebec Association of Architects, and the President of the Quebec Builders' Exchange will be responded to by J. H. G. Russell, President of the R.A.I.C. On the afternoon of the second day V. J. Elmont will read a paper on "The Application of Reinforced Concrete to Dome Structure." Arrangements have been made for complimentary luncheons by the architects of Quebec City, also an automobile trip to the various points of interest in this old historic town.

The rural district council of Balrothery, Co. Dublin, are about to build 104 labourers' cottages, in various parts of their district, from plans by Mr. Anthony Scott, M.S.A., of Upper Sackville-street, Dublin.

Mr. W. Prince, gas engineer and manager at Stoke-on-Trent, has been appointed to a similar position under the Tipton Urban District Council, in succession to Mr. S. O. Stephenson, who lately resigned to take up an appointment elsewhere.

The Anderson Board School at Gilmerton, N.B., was opened by Lady Susan Gilmour on Friday. It has been built for the Liberton School Board from plans by Mr. J. Inch Morrison, L.R.I.B.A., of Edinburgh, and accommodates four hundred scholars.

On the occasion of his leaving Brillington to take up his duties at the University of London, Mr. E. R. Matthews, late surveyor to the Brillington Town Council, has been presented with a silver épergne and two silver vases by the Brillington branch of the Municipal Officers' Guild.
